Imagine this group of marvelously gifted artists appearing on one platform, in one evening! They would pack the biggest auditorium.

Yours is the privilege of hearing them, from the depths of your pet arm chair, any evening you choose. And with every individual intonation and shading, every gleam of warm tone color. For all these famous stars of concert and opera make records for Columbia.

Drop into any Columbia shop, select from the varied repertoire of these superb artists the selections for which you care the most, and ask the dealer to play them for you on the Columbia Grafonola.

"YOU SEE IT'S A MARITIME FENCE"

Maritime fences will stand the severest tests, because they are built throughout of extra heavy hard drawn No. 9 steel wire. The superior stretching power of No. 9 wire keeps the strands from snapping under heavy strains or hard frosts. Each fence is thoroughly galvanised and will sturdily resist the rust and rot of weather.

STANDS THE TEST OF MAN, BEAST, WEATHER and TIME

The strands and stays are firmly gripped at every join by our special time tried and tested never-slip lock. Even after years of hard service, Maritime wire fence retains its sagless shape and sightly appearance. All Maritime Fences are carefully inspected and rigidly tested before leaving the factory. When you buy it you know you have got something that is bull strong and hog tight, something that will withstand greater strain than it is ever likely to receive.

Before you buy fencing it will pay you to first learn what the Maritime has to offer in the way of real fence service.

For sale by agents and dealers in nearly every section.
If you don't know the local dealer, write to us direct.

Make Your Dollars Earn More

The Farmer knows very well that the great increase in the price of the products of his farm has been largely offset by the unprecedented advance in the cost of labor, feed and the necessities of life which he himself does not produce. If he made money ten years ago to do as well now, he must make considerably more. But there is one thing to keep in mind. Just as his hired man earns twice the wage of ten years ago, SO WILL THE FARMER'S DOLLAR EARN TWICE THE WAGE.

There are on the market to-day High Grade Industrials, fully protected, paying Dividends in Quarterly instalments of from seven to eight per cent. annum. At St. Stephen, N. B., there is a thriving shoe factory which in seven years has become a national institution and which, on small capital has built up a reserve of nearly $60,000. For the purpose of doubling the output of this factory, we are offering an issue of $100,000 preferred stock of

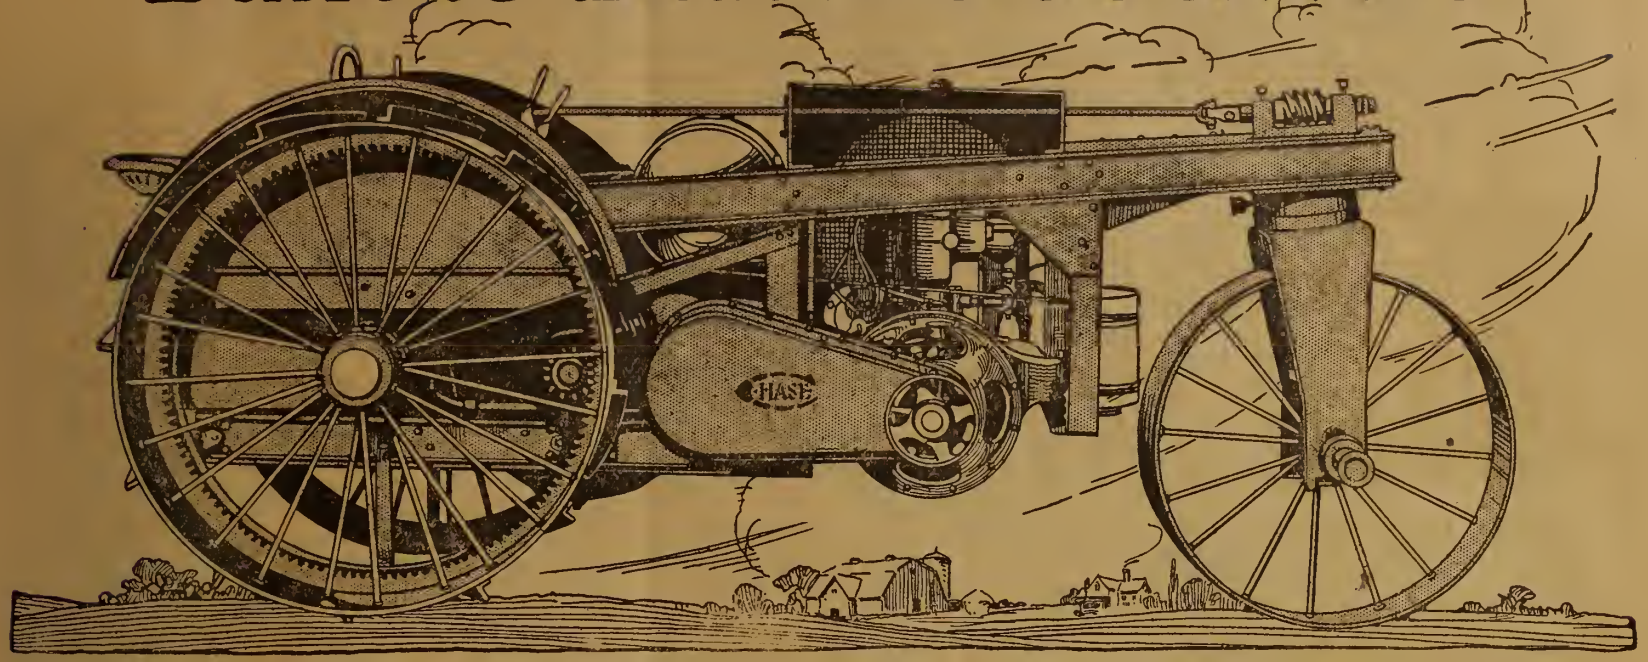
"Built to Build Goodwill"



The Tractor without Differential Gears

A tractor has no more need for differential gears than it has for a fly-net. Those gears serve no good purpose in a tractor. And they do cause constant trouble, rob the motor of power, and shorten the life of the tractor.
The Chase Tractor **has no differential gears.**
The two rear wheels get equal driving power, turn over at equal speed, apply the force of the heavy-duty motor at its full efficiency.
That means that when the Chase gets into a hole, both rear wheels work to pull it through. When obstacles are met the Chase rides over them. In plowing on the level or on sidehills the side-draft does not pull the Chase off its true course.
The Chase therefore, avoids a very common tractor trouble.

A trouble-maker avoided

Tractors with differential gears can do their best work only on a straight-way pull on level land. The moment one wheel meets an obstacle, the differential throws all the power into the other wheel. So quite often you see such a tractor with one rear wheel dead and the other spinning. That happens when the tractor gets one wheel in a mud hole. The very time when extra driving force is needed the differential gears rob the motor of its power to move the tractor.
The same thing occurs in a lesser degree in all plowing work. For the side-draft tends to place more load on one wheel than on the other and the differential gears throw the power into the other wheel. **The tractor with differential gears is more than half of the time a one-wheel-drive tractor.** The Chase Tractor, **having no differential gears,** is always pulling evenly on both rear wheels.

For that reason it operates with less power and so saves kerosene.

Gears waste power

But there is another saving of gas from this same feature of Chase construction. Differential gears rob a motor of about 10% of its power. 10% that does the tractor owner no good. The Chase saves that 10% because it has no differential gears.

The even pull saves money

Pulling evenly the Chase wears evenly. Lasts longer. Requires less adjustment of bearings. Needs fewer repairs. And, for that reason, stays more steadily "on the job."

As a practical man can see, the whole of the Chase Tractor gives proof of the same sensible, common-sense idea of design in every part of its construction.

Watch it in action and you will see in the smooth-working Chase a quality that you expect only in a high-grade, perfectly adjusted machine.

Built to build goodwill

Canadians build the Chase—in Canada. Canadians build the Chase that is sold in Great Britain and foreign lands—yes, and also in the United States. The Chase institution was created to establish in Canada a world-wide tractor business founded on Canadian principles of doing business. The men behind it, R. J. and W. J. Cluff, are men with high manufacturing ideals. They are exacting in their demands. They want the men who buy Chase Tractors to make money out of them. They are determined that every customer shall receive the service he requires to keep his Chase Tractor always at its best and always "on the job."

Investigate Our Service

You will find it to your advantage to deal with an institution with these ideas of service. You will find that the Chase Tractor is a piece of machinery that will gladden your eye. If you haven't seen it, be sure to do so. Or, write for illustrated literature and detailed information. We will send it promptly and tell you where you can see a Chase Tractor.

SPECIFICATIONS

Motor—Buda Model H.T.W. Heavy duty, Tractor type 4 cyl. 4¼" bore, 5½" stroke. Set crosswise of frame. Every part readily accessible. Extra large water passages for cooling. Force-feed lubrication, thorough vaporizing of low-grade fuels. Heated and "water washed" air.

Fuel—Specially designed to burn Kerosene or low-grade gasoline.

Drive—No differential gears are used, the drive being direct from the transmission to outer rim of wheel through bull pinions and gears. Both bull pinions and bull gears cut from forged steel and case-hardened.

Transmission—Fully enclosed and running in oil. Myatt roller bearings. Very simple type. Gears accurately machined from high grade steel.

Chain Drive—Power is delivered to the transmission gears by a wide chain fully encased and running in oil.

Belt Pulley—In direct line with crankshaft—no bevel gears. Located at side—best position for lining up with the machine to be driven.

Control—Driver has unobstructed view. Control levers are simple and easy-working.

Turning-radius—12 feet circle.

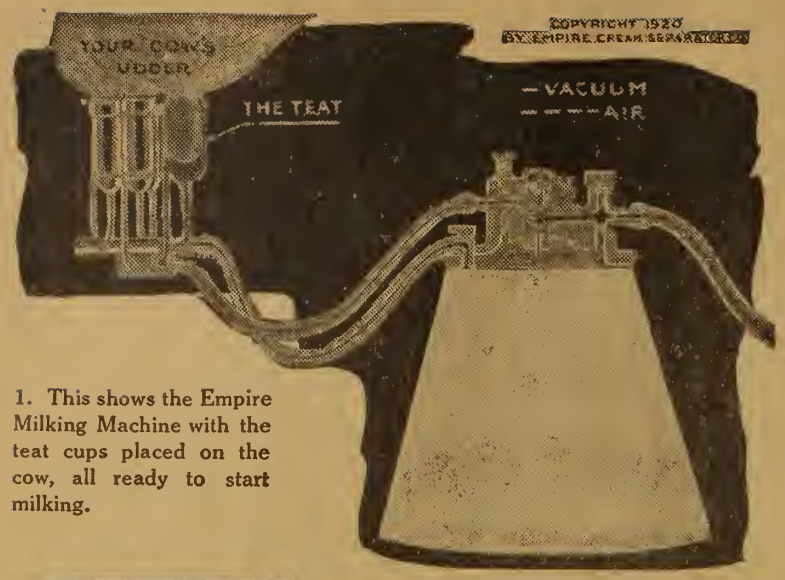
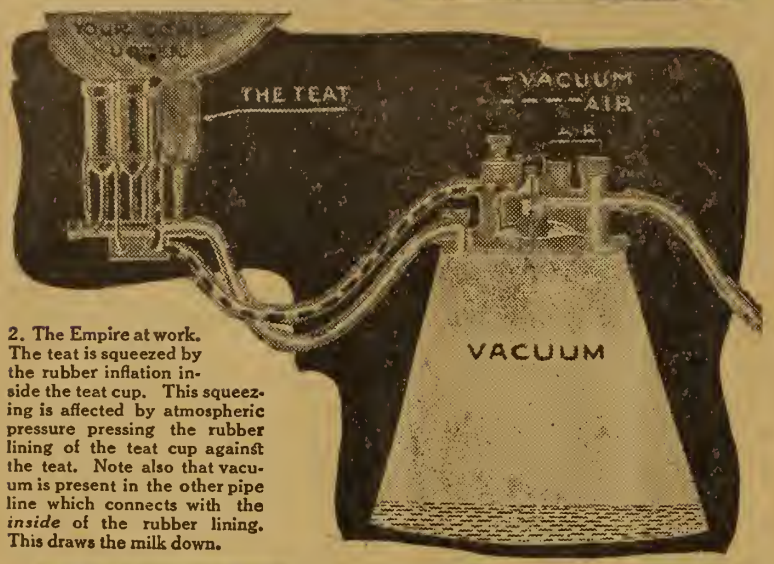
Eastern Motors Limited **Wholesale Automobiles.** **Fredericton, N. B.**

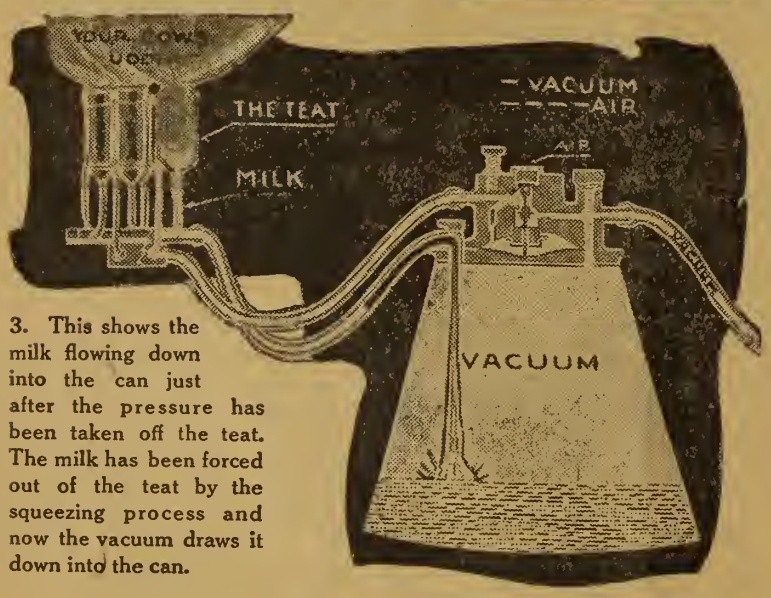
CHASE TRACTOR



1. This shows the Empire Milking Machine with the teat cups placed on the cow, all ready to start milking.



2. The Empire at work. The teat is squeezed by the rubber inflation inside the teat cup. This squeezing is affected by atmospheric pressure pressing the rubber lining of the teat cup against the teat. Note also that vacuum is present in the other pipe line which connects with the *inside* of the rubber lining. This draws the milk down.



3. This shows the milk flowing down into the can just after the pressure has been taken off the teat. The milk has been forced out of the teat by the squeezing process and now the vacuum draws it down into the can.

Why does the action of the Empire teat cup "go the calf one better?"

The young calf sucks—creates a vacuum which pulls the milk from the teat. ***So does the Empire Milker.***

Then the calf swallows and—***here's the important thing***—its tongue massages the teat from tip to udder. That pressure of the calf's tongue relieves the teat by sending back into the udder the blood drawn down into the teat during the sucking process. ***The Empire teat cup inflation does exactly the same thing,*** by the gentle application of atmospheric pressure—NOT compressed air—between the teat cup shell and the soft, pliable rubber inflation.

BUT—the poor little calf may be very hungry; he may suck too hard. ***That's one instance where the Empire "goes the calf one better".*** BECAUSE, the action of the Empire is always uniform and gentle—since the vacuum is controlled by a relief valve. And you can't put a relief valve on a hungry calf. He wants ***milk,*** and he's not particular how he gets it.

Now let's talk on hand milking. Even a casual study of the diagrams on the left will prove that it is impossible for hand milking to be as uniform as that of the Empire, no matter how experienced the hand milkers may be. It would be about as impossible as making pins by hand and expecting them to be as uniform as those turned out by the pin-making machine. And note this: The Empire is not only uniform, but it is so simple to operate that ***it makes everybody an expert milker.***

Now take a glance at the pulsator on the top of the Empire pail. Note its extreme simplicity. There are only five moving parts. ***Note that it has no piston.*** You can readily appreciate how much such simplicity practically eliminates wear and tear—Empire means life-long satisfaction.

We can't tell you our complete story here. We haven't said a word about the increased profits that follow the installation of an Empire Milking Machine. We haven't touched on the endless time and labor saving. And there's a hundred and one other things you should know about the Empire, BUT THERE'S ONLY ONE WAY YOU CAN GET OUR COMPLETE STORY—and that is by sending for our catalog 20 Why not drop us a letter in the next mail.

Canada's Greatest Farm Help

For twenty years The Canadian Fairbanks-Morse Company has been making engines, scales, and other improved farm equipment for Canadian farmers. But what we consider our greatest accomplishment—the one thing of greatest usefulness, comfort and convenience—the greatest of all farm help is

The "F" Power and Light Plant

We have built an enviable reputation for dependable products, good service and fair prices, but we believe the "F" Power and Light Plant will prove to be such a universal benefit to the farming community that it will eclipse even the record of the past.

We know there is no power and light plant which begins to approach the "F" Plant for utility, flexibility, economy and price.

Our Toronto factory is turning the "F" Plant out in great numbers every week to supply the demand. Each plant is minutely inspected, thoroughly tested, broken in, and when finally approved is ready for year after year of satisfactory service.

The installation of these plants is entrusted to the most dependable and skilled men we are able to find in every district. As part of the Fairbanks-Morse organization, they may be depended on to give owners of the "F" Plant satisfactory service, cordial treatment, and the fullest co-operation in showing the various utilities and advantages of the "F" Plant.

If you do not know the Agent in your territory, or merely wish to investigate the "F" Plant, send coupon to our nearest office and a catalogue will be forwarded to you without delay.

Let's Clear the Atmosphere a Bit

The Maritime Farmer is Fighting the Battle of the Farmer and Against Those Who Would Exploit His Politics and His Pocket

The Grain Growers Guide, Winnipeg, has flooded the Maritime Provinces with circulars attacking the Maritime Farmer. This paper has been accused of all sorts of things. We have made certain statements which the Guide resents. Naturally being out of keeping with the general plan the Guide had in view to flim-flam the farmers of the East, the Guide is annoyed.

The first step in this campaign was an attempt to buy the Maritime Farmer. This failed. It failed because the Grain Growers Guide and the man who controls the stock of the Maritime Farmer, Mr. J. D. McKenna, Sussex, do not agree as to what really is in the interests of the farmer. The Grain Growers of the west have apparently made large sums of money out of the farmers. In this province, an organization was started which was to sell goods cheaper to farmers and at the same time pay dividends, two in number to farmers who could be induced to purchase stock. To control the organization a central board was formed, which to all intents and purposes was to act as a middleman organization for branch stores.

Long before either the Grain Growers or the United Farmers had decided to confer on the farmers of this province co-operation, which takes profits from farmers, instead of returning them to the BUYER, we had co-operative methods firmly installed in New Brunswick. Through the efforts of the Agricultural Societies United, the cost of fertilizer to the farmers of this province was reduced, in some cases one-half. The Maritime Farmer, as a matter of policy, decided to extend this work by buying feeds and seeds co-operatively for farmers. We did not handle one cent of cash in most of these transactions. We got together such a volume of business, that it commanded the respect of those who had goods to sell, and we placed the farmers of the east in touch with sources of supply, and they paid their bills direct and bought as cheap as any other buyer in these parts. Thousands of farmers know what has been done along that line, and appreciate the service the Maritime Farmer has rendered them.

Well, all this looked good to somebody, and other co-operative methods were devised, whereby those who have money to invest, could make money out of the farmer who did not feel inclined to put money into storekeeping. What was the result? Those farmers who continued to buy through the Maritime Farmer, have been getting their feeds over five dollars per ton cheaper than did the farmers who put up their cash and kept it up.

When it comes to seeds we bought for farmers in the Maritime Provinces this very year, clover, alsike and timothy seed. The No. 1 clover cost the farmers of the Maritime Provinces four thousand five hundred and fifty dollars per car less than the United Farmers, of Ontario, offered it to the farmers of Ontario. The price of alsike was three thousand, five hundred and fifty dollars per car less, and we not only bought and delivered No. 1 timothy cheaper than the United Farmers of Ontario sold No. 2 timothy for, but our price on No. 2 seed was thirteen hundred and sixty-five dollars per car less than the prices quoted to Ontario farmers by the United Farmers Co-operative Company, 130 King Street East, Toronto. New Brunswick and Nova Scotia farmers were saved these great amounts by the Maritime Farmer, despite the fact that we paid the freight on these seeds to Sussex and took for ourselves sufficient to cover the cost of getting the orders together and handling them.

We ask the farmers of the Maritime Provinces were ever men caught more red-handed in profiteering from the farmers than in this instance? And we propose to keep on helping the farmers of the Maritime Provinces, and we make this offer—that if any body of farmers decide to start a store—and to be frank it has not been the experience that such stores are profitable—we will put that body of farmers in touch with sources of supply where they can secure supplies at wholesale rates—and never have to hand over any of their capital to the head office of the United Farmers, Woodstock, or pay that middleman organization one cent of profit.

We believe that the biggest asset in any co-operative movement is the buyer. Without his trade no store can flourish. Knowing that, the Maritime Farmer has worked in the interests of all the farmers, and not the fellows alone who have money to invest. Therefor, it was, that the Maritime Farmer decided to carry on the work it has been doing. And so it refused to sell itself body and soul to Winnipeg, to become a political hack, advocating just what Winnipeg directed that it should advocate. No farmer has ever been advised by this paper as to what his politics should be, and no farmer ever will. His political leanings and those of his neighbor are not the business of this paper or any other paper. We are here to serve the farmers of the Maritime Provinces, first, last and always as farmers. If they are Grit, Tory, Independent or United Farmer, they will get just the same treatment from this paper. But we do not propose to sit idly by and see these men robbed in cold blood, and by men who, while professing to help farmers, are profiteering from them to the full extent of their ability.

The Maritime Farmer and its methods are too well known to the farmers of this part of Canada to need any defence. We make this charge again that the Grain Growers are in full charge of the political campaign which is being conducted in this province and in Nova Scotia, and that this campaign is being conducted solely for their own benefit. We maintain again that if the monies of Canada are to be used to assist the wheat growers of the prairies, then our own farmers should receive the same treatment. We charge that the Maritime Farmer has been and is being systematically condemned for asserting that the potato growers of these provinces have equal rights with any western farmer, and we believe that this attack is being directed from a central source.

We are prepared to support any movement the farmers of the Maritime Provinces may undertake, but we are not going to be bought or frightened into condoning the exploitation of the farmers of this part of the country. We are free niggers, uncontrolled by any organization or by any party. We have made statements which are serious. We are prepared to back them up. We do not propose to reply to the campaign from Winnipeg. We expect to go on about our business as usual serving the farmers of Eastern Canada. We never have opposed farmer organizations. We are with them to the drop of the hat, but as we said before, we will not hesitate to expose conditions such as we know to be not in keeping with the professions of those who make them. We have served united farmers' organizations in the past, we will be at their service in the future, and we hope to their financial welfare.

In the meantime, the new paper which Winnipeg owns in greater part, after charging some farmers $1.50 per year, has dropped the price to 75 cents to others. Here again is a chance for a refund. Surely every subscriber is entitled to the same treatment. Those farmers who have paid the high price are entitled to some of their money back.

Ownership of the U. N. F. Guide Fixed

Circulars have been sent broadcast to the effect that the United Farmers' Guide is owned by the Farmers of the Maritime Provinces. This paper claims that the new paper is owned and controlled in Winnipeg. Speakers have everywhere told audiences that the Grain Growers' Guide did not control the new paper. Read this announcement, which is taken from the Grain Growers' Guide of March 31st, 1920;

THE UNITED FARMERS' GUIDE

On April 7, the first issue of The United Farmers' Guide will be published at Moncton, New Brunswick, as the organ of the organized farmers of the Maritime provinces. The farmers in Nova Scotia, New Brunswick and Prince Edward Island have been interested in organization and already have made a big start. They have had, however, no journal to serve them as The Grain Growers' Guide has served the farmers in Western Canada. The result has been that The Grain Growers' Guide has united with the farmers in the Maritime provinces to publish the United Farmers' Guide to assist them in their work. The Grain Growers' Guide will be the chief owner of the new paper and it will be published under the same management as The Grain Growers' Guide. The United Farmers' Guide will be the same size and made up in the same form as The Grain Growers' Guide.

There are a great many Maritime province people in the prairie provinces, and no doubt thousands of them among the readers of The Grain Growers' Guide. They are fully aware of the benefit which The Grain Growers' Guide has been to the organized farmers in the West. No doubt many of them would like to send a subscription for the new paper to some of their friends who are still living in the Maritime provinces. The subscription price of The United Farmers' Guide is $1.50 per year, or $3.00 for three years. We would ask any person who wishes to help the movement in the Maritime provinces to send in subscriptions for their friends who are living there so as to get as many subscribers as possible. Send all subscriptions to The Grain Growers' Guide, Winnipeg, Man., and they will be forwarded to the Moncton office, and each subscriber will receive the first issue of the new paper.

THE GRAIN GROWERS' GUIDE.

Now we ask in the light of this, is the Maritime Farmer not absolutely right in preserving its independence, in order to speak for the Eastern Farmer? Already this paper has made the question of wheat buying by the Dominion Government at least a remote proposition.

Dominion Educational Butter Scoring Contest, 1919

By Geo. H. Barr, Chief Dairy Division

Plan.—The Dairy and Cold Storage Commissioner, Ottawa, made arrangements with the Provincial Dairy Commissioners and Superintendents of Dairying to select 4 creameries in each province that would manufacture and ship to Montreal in the months of May, June, July, August, September and October, one 14-lb. box of butter. British Columbia selected only 3.

The method of manufacturing the butter was left entirely in the hands of the creamerymen and the provincial authorities. Blank churning records were furnished each creamery to be filled in and forwarded with the samples. Upon arrival in Montreal, the butter was placed in cold storage at from 12 to 15 degrees temperature. A few days after the samples were received, they were scored by Mr. P. W. McLagan, Montreal, Mr. J. B. Muir, Ingersoll, and the writer, and were rescored for flavor by the same parties each succeeding month until October. The August, September and October samples were again rescored for flavor on December 17th.

Objects of the Contest:

(1)—To ascertain if it is possible to make as fine butter in one province as another.

(2)—To find out if possible the best method of handling the cream and churning it to make the finest and best keeping quality of butter.

(3)JTo try and establish a type of butter which would meet the requirements of the export trade and also be suitable for the best markets in Canada.

(4)—To promote a healthy rivalry between the different provinces in making the finest quality of butter.

(5)—The Contest would indicate to some extent the effectiveness of the dairy educational work being carried on in each province.

To what extent has the contest worked out these problems? We think the question of making a uniformly high grade of butter in each province has been definitely settled. Note the uniformity in the total score on the best sample from each province:

	Points
British Columbia	97.1
Alberta	98.0
Saskathcewan	98.5
Manitoba	98.0
Ontario	96.5
Quebec	98.5
New Brunswick	96.8
Nova Scotia	98.0
P. E. Island	98.0

Following is the percentage of the total samples from each province that were placed in Special Grade at the first scoring. The minimum score for Specials is 41 points for flavor and a total score of 94 points.

Province	p. c. samples grading Specials	Tot'l No. Samples
Quebec	73.9	23
Manitoba	70.0	20
Alberta	68.1	22
Nova Scotia	57.1	14
Saskatchewan	36.3	22
British Columbia	33.3	22
P. E. Island	30.0	20
New Brunswick	21.7	23
Ontario	10.5	19

Although there is considerable difference in the number of special grade samples from the different provinces, every province has made Specials. We can, therefore, say that the finest butter can be made in every province.

Acid in Cream.—The Contest shows that the very finest butter can only be made from clean sound flavored cream. The keeping quality of the butter made from cream with .35 per cent. acid is as good as that made from cream with less than .2 per cent. acid, but .35 per cent. is about the limit to make the finest flavored butter with long keeping qualities.

The churning records indicate that 15 samples of butter were made from cream in which the acid had been neutralized. The average acidity before neutralizing was .615 per cent. and after neutralizing was .262 per cent. The deterioration in flavor in these samples betwen the first score and the last rescore was 1.57 points, which is only .42 points greater than the average deterioration in all the pasteurized samples and 2.49 points less than in the samples made from unpasteurized cream.

Pasteurization.—It has been generally admited that pasteurizing the cream improves the keeping quality of butter. The Contest bears out this fact. But pasteurization will not produce special grade butter from sour, poor flavored cream. High pasteruization, (160 to 185 degrees), has given exceptionally good results in the keeping quality of the butter.

Samples made from cream pasteurized to a temperature of 160 degrees and held for from 10 to 20 minutes have held their flavor equally as well as those from cream heated to 180 degrees. We would, however, recommend the higher temperature to be absolutely certain that the work is effected.

The percentage of samples made from pasteurized cream which passed from Special and No. 1 Grades into No. 2 and Off Grades between the first scoring and the last rescore, was 17 per cent., and from unpasteurized cream 100 per cent.

The deterioration in flavor during the same period was almost three times as great in the samples made from unpasteurized cream as in those made from pasteurized cream.

The tendency of pasteurizing is to produce a mild flavor in the butter. Many people do not like butter of this character. They prefer butter with some taste to it, but the rescores show that the samples with this mild flavor are keeping better than those with the higher or more pronounced flavors and the creamerymen and butter dealers will do well to note this fact.

The Storch Test.—This test is based on the principle that milk and cream produced normally contains certain deoxodizing ferments which are known as peroxidase. If when a few drops of an "indicator" and a "reagent" are added to a sample of milk or cream, an immediate color reaction occurs (milk and cream, indigo-blue; whey, violet-red) then the sample has not been heated above a certain critical temperature, or it may not have been heated at all. If the sample turns a pale grey in color either immediately or within half a minute's time after the addition of the reagents, then it has been previously heated to the "border line." If the sample remains white or develops a very pale violet-red tone by the addition of the reagents, then it has been heated to a temperature sufficiently high to destroy or to render inactive the peroxidase ferment.

In reporting the Storch Tests in this Contest, three terms were adopted: "No Reaction" when the sample remained white; a "Light Reaction" when the sample turned a light grey color; and a "Strong Reaction" when the sample turned a dark blue color.

The following brief statement shows the value of the test in relation to the keeping quality of the butter.

130 samples gave "No Reaction" and at the last rescore 8 of those samples or 6.07 per cent. were placed in Off Grade for flavor; the churning records indicate that 5 of the 8 samples were made from cream in which the acid had been neutralized and 2 were made from unpasteurized cream and no record as to the acidity or condition of the cream was given. It has been found that a very high acidity on the cream will affect the Storch Test results and I am not prepared to say what effect neutralizing the acid in the cream has on the keeping quality of butter..

31 samples gave a "Light Reactioc" and at the last rescore, 11 of these samples or 35.5 per cent. were placed in Off Grade for flavor.

20 samples gave a "Strong Reaction" and at the last rescore, 50 per cent. were placed in Off Grade for flavor.

These results would indicate that the Storch Test is a fairly reliable test to show the keeping quality of butter and can be used to very great advantage in commercial grading.

Uniform Type.—The type of butter that pleased the scorers best and, in fact, everybody else who saw the samples, was that which came out on the trier like a piece of wax and showed little or no moisture on the butter, or on the back of the trier; texture, close and smooth; color, even and about a straw shade, and a salt content of from 1.5 to 2 per cent. The butter from the Western Provinces was usually of a closer character than that from Eastern Canada and showed less free moisture. Many of the Eastern samples showed too much free moisture and the color was often uneven. Nobody wants mottled or streaky butter and there is no excuse for this defect. More working would overcome the defects in color and would also eliminate the defect of too much moisture.

Texture.—Many of the samples were brittle or short in texture. Such butter has the appearance of being churned at too high a temperature, coming soft and then washed with very cold water. An effort should be made to overcome this defect. The butter from the Maritime Provinces is inclined to be open or loose in texture; more working would improve it. A close smoth waxy texture is what is desired.

Salting.—The amount of salt added to the butter at churning as shown by the churning records varied from 1.5 to 8 per cena. The percentage of salt in the butter as shown by the salt test varied from .8 to 4.3 per cent. The churning records for the 15 samples which scored the highest for flavor had an average of 2.73 per cent. salt added to the churning an 1.4 per cent. in the butter. If the salt test is reliable, there is either a very great difference in the percentage of salt expelled in working the butter, or there are very grave errors made in estimating the quantity of salt added to the butter.

The average per cent. added at churning and the per cent. found in the butter from each Province is as follows:

Province	P. C. Added	P. C. in Butter
British Columbia	3.64	2.13
Alberta	2.60	1.13
Saskatchewan	2.57	1.48
Manitoba	1.99	1.15
Ontario	3.44	2.38
Quebec	3.32	1.74
New Brunswick	5.29	2.57
Nova Scotia	3.67	2.07
P. E. Island	3.87	2.19

The following table is very inter esting. It shows the percentage of samples from each province which scored perfect for texture, incorporation of moisture, color, salt and packing.

Percentage of Samples Scoring Perfect

Province	For Texture	Incorporation of Moisture	Colour	Salt	Package
British Columbia	41.1	88.8	61.1	100.0	77.7
Alberta	40.9	95.4	81.8	100.0	90.4
Saskatchewan	50.0	86.3	59.0	100.0	81.8
Manitoba	65.0	90.0	75.0	100.0	95.0
Ontario	36.8	42.1	42.1	68.4	84.2
Quebec	13.0	65.2	91.3	100.0	91.3
New Brunswick	47.8	26.1	52.1	60.4	82.6
Nova Scotia	64.2	64.2	78.6	78.6	92.8
P. E. Island	30.0	15.0	65.0	75.0	100.0

This table shows very plainly where the buttermakers in each province fell down in workmanship, and it also shows that in some cases there is very great room for improvement.

The Standing for Workmanship by Provinces is as Follows: Maximum Score 45 Points.

1st—Alberta	44.63 points
2nd—Nova Scotia	44.55 "
3rd—Manitoba	44.54 "
4th—Quebec	44.44 "
5th—P. E. Island	44.29 "
6th—Saskatchewan	44.25 "
7th—British Columbia	44.11 "
8th—New Brunswick	44.11 "
9th—Ontario	44.00 "

NOTE.—In working out the above points, it was considered advisable to leave out the score for salting. Theer are very wide variations in the quantity of salt required for the different local markets, and as some of the creameries make butter for local markets only, the salt in some of the samples was too high for export trade and were scored down accordingly.

The Following Creameries in Each Province had the Highest Score for Workmanship

Name of Creamery	Address	Province	Average Score
Scotsburn	Scotsburn	Nova Scotia	44.86
Crescent	Winnipeg	Manitoba	44.83
Morkebery Cry. Co.	Markerville	Alberta	44.92
St. Hyacinthe	St. Hyacinthe	Quebec	44.61
Farmers' Co-op.	Moncton	New Brunswick	44.58
Bowes Co.	Toronto	Ontario	44.57
Central Bedeque	Central Bedeque	P. E. Island	44.52
Tantallon	Taltallon	Saskatchewan	44.51
P. Burns & Co.	Vancouver	British Columbia	44.27

Manuafcturing a uniform type of butter all over the Dominion is no doubt a big problem, as it depends almost entirely on workmanship and it is no small undertaking to get about one thousand men churning and working the butter in the same manner, but the Contest shows that there were a good many samples from every province which scored nearly perfect workmanship.

A Healthy Rivalry between the Provinces.—A good stiff competition will bring out the best that is in a man, and although there are no rewards offered in this Scoring Contest, there is considerable honour to those who win the highest standing. The fact that the man who makes the butter knows it will be placed alongside of samples from every province in the Dominion, should stimulate him to do his finest work and when we get the best men in each province doing their best work, we will certainly get a comparison of the very best methods of manufacturing creamery butter. With the churning records of the highest scoring samples each month before him, a buttermaker ought to get some useful information to put into practice. We hope this year to place in the hands of every buttermaker in Canada a copy of the monthly report of the Contest. Let us have a splendid exhibition of workmanship and skill in our 1920 Contest.

Dairy Educational Work.—The proof of effective dairy educational work is shown in the quality of the finished products. Although only 4 creameries from each province are competing, they will to a greater or less extent reflect the character of the work which is being done in the balance of the creameries in the province, and the dairy authorities in each province would do well to watch the successful competitors in this Contest and put into practice the methods that are producing the finest butter.

Summary

(1) The very finest butter can be produced in every province in the Dominion.

(2) Excellency of workmanship would appear to have more to do with the production of fine butter than either climatic conditions or geographical position.

(3) The finest butter can only be made from clean sound flavoured cream.

(4) Cream should not have more than 3.5 per cent acid if the best butter is to be made.

(5) Results indicate that pasteurizing good cream to temperatures from 160 to 185 degrees will ensure good keeping butter; also that sour and poor flavoured cream pasteurized to the above temperature will have very much better keeping qualities than butter made from the same grade of unpasteurized cream.

(6) The deterioration in the flavour of butter made from unpasteurized cream was nearly three times as great as in the butter made from pasteurized cream.

(7) The Storch Test we consider a valuable test to indicate the keeping quality of butter.

(8) The addition of about 3 per cent salt to the butter fat churning will in most cases produce butter as far as salt is concerned that will suit the best trade in Canada and also the British markets.

Clover Culture and Seed Selection

An address before the F. & D. Convention at Fredericton, March 16th, 1920, by O.C. Hicks, B.S.A.

The essential nature of the grass and clover crop is little realized. When the phrase "Food will win the war" was on every tongue the public thought only of wheat, potatoes, butter, cheese and pork, forgetful that back of these was the clover crop, the mainstay of the farmer and dairyman; or that the effectiveness of cavalry regiments and thousands of horses overseas with the Expeditionary Forces in France and on other fighting fronts depended on the daily forage ration of timothy and clover hay.

During the war the Imperial War Office bought in Canada through the Dairy and Cold Storage Branch of the Department of Agriculture 481,250 tons of hay. Hay-pressing plants were operated at St. John, 1915-16 and at Woodstock, 1916-17 and a large special plant at Montreal, where hay was recompressed. When the United States entered the war Canada supplied their Overseas Army with 162,225 tons more—a total of 643,457 tons.

The New Brunswick hay crop for a number of years has been over one million tons, grown on three-quarters of a million acres. The crop of last year is estimated at 1,111,000 tons, grown on 748,000 acres.

Try to think for one moment of the appalling distress that would be caused should the clover crop fail for one single season. The Western Provinces had a dry year last summer. The pastures were parched, the cattle starved, and to save the herds Governments and railways co-operated to shoulder the burden of transporting the live stock to green pastures. Cattle were even sent as far south as Texas to graze.

At a low estimate one-tenth of the area in hay crop in the Province is reseeded annually, that is, seventy-five thousand acres. How much seed is used on this, and what is the outlay required to buy the seed? The answers to these questions disclose the importance of the seed phase of growing the hay crop.

The majority of farmers sow 1 peck of timothy seed mixed with 1 quart of red clover and 1 quart of alsike seed per acre. Say, 10 lbs. of timothy, 2 lbs. each of red and alsike clover. Now, at the present cash price for No. 2 Timothy and Red Clover, and No. 1 Alsike, it costs $4.20 for the grass seed for one acre. That is, the farmers of the Province will spend for grass seed $315,000.00 and for this amount the 75,000 acres will be seeded down with 1,050,000 lbs. of seed, most of it imported stock.

There is today a great deal of talk about the small buying power of the Canadian dollar when sent to the United States. The following figures of the trade in grass and clover seeds between the two countries may offer a partial explanation, for nowadays when we hire someone else to do our work, or grow our foood supply or seed stocks we must expect to pay well for it.

The importation of clover and timothy seed were as follows:

Clover (lbs.)	Timothy (lbs.)
1914—3,326,952	1915—11,553,700
1916—4,801,731	1916—10,935,730
1918—2,586,886	1917—11,196,094

The exports for the same years to U. S. were as follows:

Red Clover (lbs.)	Grass Seeds (lbs.)
1914—129,406	1916— 736,030
1916— 67,342	1916— 689,446
1918— 48,790	1917—1,960,207
1919—850,165	Alsike—10,019,462

This balance of trade in so far as New Brunswick is concerned can be changed so that clover seed may be exported. Our seed is superior in vital energy, it grows hardy plants and makes better permanent pastures.

Northern Grown Seeds

A large seed firm of Chicago, specializing in grass and clover seeds, makes extravagant claims for northern-grown seeds bought in Canada. Tests made at Experimental Stations and privately owned farms in Canada and elsewhere have proved the hardiness and superior quality of home-grown over imported Red clover seed.

At the Svalof Station in Sweden, careful comparative trials were conducted with a large number of Swedish and foreign clover sorts during the years 1907-1910. The winter of 1908 was quite severe with the result that English and Chilian clovers were completely killed out while the Swedish remained and gave a crop almost equal to the first hay crop of these sorts durng the preceding year.

Many complaints of failure to secure a good clover crop are due to the use of southern grown seed that is so delicate that it will not survive the rigors of a northern winter. The clover seed produced in a region where winter-wheat kills out as it does in New Brunswick is worth a good deal more for seeding down our hay fields and pastures than is the clover seed grown in the winter wheat growing States.

Good grass crops in rotations can only be secured by sowing plenty of seed. As well might we expect to gather figs off thistles as to gather a crop of clover from a grass seed mixture containing 2 or 3 lbs. only of clover seed. If you want to reap a hundred dollar per acre crop of hay then sow more seed than if you expect a fifteen dollar crop. A few men have arrived at the place where they say that they cannot continue to farm without clover and these men sow it plentifully and are better off in consequence each year.

In the report on the Illustration Farm for 1916 Dr. J. W. Robertson, Chairman, Comimttee on Lands, in a statement relating to the sowing of clover seed on the 26 illustration farms in P. E. I., N. B., N. S., Ont. and Quebec, said:

"Only two of the farmers claimed to have been showing their clover seed thick enough to ensure a good catch. Twenty-one had been sowing an average amount of six pounds to the acre, whereas they now sow ten pounds to the acre. Some had sown as low as three or four pounds, but are now convinced that ten pounds is better and are sowing it."

George R. Barrie, Gault, Ont.: "The high price of clover seed had something to do with our sowing a small amount, but since growing our own seed we do not mind sowing it heavier, and find that the extra seeding more than pays for itself."

"The farmer doing illustration work for the Commission in Lanary County, Ont., in 1914, grew 1,200 pounds of red clover seed and had never grown a pound of his own seed previous to commencing work with the Commission."

J. M. McLean, New Perth, P. E. I., "During the last two years the first crop of hay was always much better on the area sown with 10 lbs. clover and 10 lbs. timothy, while this year we have an unusual stand of clover in the plots heavily seeded. . . We find the second crop is always much thicker and of a better quality after the thick seeding."

The purpose for which red clover is grown and used is the factor which governs the time and method of harvesting and the stage of ripening or maturity of the crop.

Clover pasture is helpful and important for all farm animals. For pigs it furnishes about sufficient food for maintenance so that all grain fed goes for gain weight. Clover pastured pigs are healthy and have good bone and constitution—points of special importance with breeding stock.

Clover is used for ensilage by a number of dairymen who farm just outside of Moncton. For this purpose it is harvested when the blossoms are fresh cut and blown into the silo while wet with dew or rain.

Mr. T. B. Terry, a writer in the farm magazine, "Our Farmer," maintained a team of horses for several years on clover hay with no grain allowance of any kind.

Clover furnishes a large amount of crude protein, so essential to milk production, and is palatable and much relished. It is unusually rich in lime which is needed by the cow in large quantity and is too often otherwise supplied in very small amount in other food.

Two ton crop of clover hay to the acre removes 90.5 lbs. of limestone, and contains 74.8 lbs. of potash. The chemical composition and feeding value of clover varies at different stages of growth. The development of fibre or woody matter increases with the age of the plant, while the portein, fat and ash as well as the nitrogen free extract, which contains the more valuable carbonhydrates reach their maximum amount after that period.

The largest amount of the dry matter in clover is produced between early and full bloom. During this period 60 per cent. of the organic compounds are formed.

Practical experience places the best time to cut clover for hay when about one-third of the heads have turned brown. This is because at any earlier date the plant is so soft and sappy that only with difficulty can it be cured into good hay. To delay until all the heads are dead makes haying still easier but means poor, woody unpalatable hay.

The differences in composition and feeding value between clover cut and cured in full bloom and at maturity are as follows:

Clover at Full Bloom

1.—The crop contains less fibre than when mature.

2.—The crop contains its maximum amount of proteins.

3.—A smaller yield per acre is secured than at maturity, but the crop is more concentrated in protein.

4.—The nutrients in the crop are more evenly distributed.

5.—The crop contains its maximum amount of essential oils which impart palatability.

6.—The nutrients in the clover are more digestible.

Clover when Ripe

1.—The crop contains a larger amount of fibre.

2.—The crop contains a smaller per cent. of protein than when in full bloom.

3.—A larger yield per acre is secured, and the crop is more concentrated in carboydrates.

4.—Some of the nutrients in the crop are transferred to the seeds, leaving less in the stems.

5.—At maturity, there are less of the essential oils than at any other period.

6.—At maturity, the crop is less digestible than at full bloom.

Two methods of haying are com-

Notes From the Nova Scotia Agricultural College

DISCOVERY OF SALT DEPOSITS AT MALGASH

Readers of the Maritime Farmer are already familiar through the general press with the discovery of salt deposits at Malgash, in Cumberland County, N. S. It may not be known to many, however, that the announcement probably means much more than appears on the surface. Mr. L. C. Harloy, Chemist at the Agricultural College, has analysed some samples and states that the major part of the salt so far mined contains about 1½% of potash, the bulk of the remaining matter being common salt. Even this small proportion may prove to be of considerable value where thransportation charges are not too high.

Other samples analysed are very rich, containing up to 28% of potash. If there are extensive doposits of this type, the find will be of immense value, since material of this character will refine to as high grade salts as the muriate and sulphate of potash which were formerly obtained from Germany. These in their refined form contain approximately 50% of potash. One sample analysed gave roughly 32% potash. This is very high grade material. The German crude salts before refinement contain about 7% potash. Developmhents will be followed with eager interest by Maritime folk generally, and especially by the Fertilifier trade and the farmers.

A HIGH PRICED COLT

The highest priced home bred colt ever sold in the Maritime Provinces is the Standard bred Billy Sharon, 2.16¼. The price paid was $3,500. His sire, Captain Aubrey, is the well known standard bred stallion at the Agricultural College farm, Truro.

By the way, a request has been received through the minister of Agriculture for Prince Edward Island, on behalf of horse breeders in that Province, to send Captain Aubrey for a time back to his old home. It should be highly satisfactory to the people of Nova Scotia to know that they have at the Provincial College farm, in Captain Aubrey and other sires, individuals which are so valuable an asset to the country.

ANNUAL REPORT FOR 1919

The Annual Report of the Secretary for Agriculture is now off the press, and has already been fairly well distributed. Probably many others who would like to have it have not yet received a copy. Any interested person may secure one by applying to the Secretary of Agriculture, Truro, N. S.

It may be of value to point out some features of this latest report which are of special interest to farmers. One is that which deals with the use of various fertilizers on a run out field. Exhaustive experiments were carried out, and the results are set down in tabular form and also illustrated with photographs. This section is well worth the study of every practical farmer.

Another interesting feature is the report on the use of limestone in renovating old pastures. These are cuts of some famous cows on the College farm, illustrating the types of animal that constitute the aristocracy of the bovine world. Of these, one which will be of specail interest this year is Gardrum White Floss, the Ayrshire which won over all breeds at Amherst in 1919. Jemima Wayne Sarcastic, the Holstein dam of the cow which holds the Canadian long distance record, another member of the College herd, adorns the lower section of the same page.

In yet another section will be found a very interesting and useful report of chemical analyses of peat soils, mucks and mud, some of which have a very considerable value as fertilizers.

Poultry enthusiasts will be interested in the account of, and the photographs illustrating the First Nova Scotia Egg-Laying Contest.

All who are watching the progress of dairying in Nova Scotia will want to read the report of the Dairy Supt. This sets forth clearly the progress made by the creameries of the Province during the past fifteen years. In 1905 the total production of N. S. creameries was 290,714 lbs. butter. In 1919 the total reached 2, 093 804 lbs.

In the report of the Supt. of Agricultural Societies reference is made to the request for an increased grant to these organizations. Members of these societies will be pleased to know that this request has been granted, and the Legislature in its present session has increased the grant from $15,000 to $20.000.

CLOSING DAY AT THE N. S. A. C.

Closing Day at the Nova Scotia Agricultural College is always one of the major events among the educational institutions at Truro. This year was no exception. The term closed on April 15th, with exercises of more than usual interest.

Principal Cumming presided, and with him on the tastefully decorated platform were Mr. John Howard, Agent General for Nova Scotia in London, Eng., Mr. W. B. McCoy, Sec'y of Industies and Immigration and Mr. D. McGillivray of the Canadian Bank of Commerce, with headquarters at Halifax.

After a few preliminary remarks by Dr. Cumming, in which he referred to the College year just closing as the most successful in the history of the institution, he called on Mr. Howard, to whom he referred to as one of the real friends of the boys when overseas, and an unfailing source of help by way of inforbation and counsel to thir parents at home.

Mr. Howard congratulated the gradlates on the high reputation and ability of the Principal and staff under whom they had studied. He hoped that these young men who had had such special opportunities would prove to be leaders in every good cause in the various communities to which they would go. He also expressed the hope that they would be the means of encouraging the immigration to this country of capable and ambitious farmers from the old country who may be looking for new opportunities.

In introducing Mr. McGillivray as the principal speaker of the day, Dr. Cumming described him as a fine example of the man who, besides being a specialist and a success in his own chosen line, takes a strong and active interest in every movement for the well-being of his community.

Mr. McGillivry's address was of a very high order. He began by expressing his delight in the beautiful surroundings of the College, and in the unexpectedly large audience present. He went on to pay a high tribute to the profession of agrficulture, saying that every intelligent person today places the farmer among those at the very apex of important callings, and as honorable as any.

The speaker urged the graduates of the College to carry into their communities the spirit of a broad-minded charity. The curse of the world today is class consciousness, the tendency of one calling or profession to distrust, denounce and even despise those of another.

A fine tribute was paid to the boys who had gone overseas, many of whom had laid down their lives in the sacred cause of humanity. In the great victory a fundamental element was the food largely contributed through the exertions of the farmers. Now the big word is "Reconstruction." He would suggest instead the word "Replenishment," and in the replenishment of the world's supplies the farmer must play the first part.

The key-note of Mr. McGillivray's address was service. He gave his audience a four fold definition of the purpose of education as a working basis for life.

1.—To teach us to delight in the things we should delight in.

2.—To earn a living.

3.—To become a good neighbor.

4.—To enrich the life of our time.

The last speaker was Dr. Soloan, Principal of the Normal College, who congratulated the Staff of the N. S. A. C. on their success in making their institution something much greater than a technical school.

Following is the list of those who received Diplomas:

Edwrd Bonyman, New Anan, N.S.; Ned Burnaby Eaton, Lower Cunard, N. S.; Wm. Glennie Hamilton, Lower Truro, N. S.;Arthur Phillips Laidlaw, Halifax, N. S.; Donald Murray McKeen, Canning, N. S.; Harold Rjck, Falmouth, N.S.; Cecil Blanchard Selfridge, Aylesford, N.S.;Lemueal Neil Vickerson, Hermitage, P.E.I.; Murray McKenzie, Waterside, N.S.; George Parker Walker, Fredericton, N. B.; Clarence Francis Elderkin, Falmouth, N. S.; Harold Kingdon Bate, Newcastle, N. B.; John Albert Bentley, Halifax, N. S.; James Logan Clark, Bayhead, N. S.; Harold Waldorf Clay, Bridgetown, P.E.I.; Chas. McKittrick Collins, Abney, Lot 64, P.E.I.; Dwight Wallace Guiou, Ottawa, Ont.; Rudolph John Haase, Glace Bay, N.S.; Robert Jarvis Haslam, Bradalbene, P. E. I.; Wm. Burpee Jackson, Scotch Lake, N. B.; Angus Duncan McDonnell, Port Hood, C. B.; Harry Edison Miller, Windsor Junction, N.S.; Robert Lee Payne, West Bathurst, N.B.; George Belden Treen, Pugwash, N.S.; Smith Albert Hilton, Carleton, Yarmouth Co., N. S.; George Thomas Frederick Wood, Crter's Point, N. B.

The winner of the Governor General's Medal is Smith Albert Hilton. Mr. Hilton also won the privilege of having his name inscribed on the big silver cup by taking first place in seed judging.

Passed from first year into second year:

Eddie Anderson, Morrell, P. E. I.; Fred F. Annis, Carleton, N. S.; Geo. Archibald, R. R. No. 3, Truro; Everett F. Armour, Upper Dorchester, N. B.; J. D. Atkinson, Fredericton, N.B.; Grant Beckwith, Steeves Sett., N. B.; John C. Bennett, Frederjcton, N. B.; Earle Burpee Brown, Cambridge, Kings Co., N. S.; Donald Carde, Central Burlington, N. S.; John Gordon Clarke, Tatamagouche, N. S.; Kenneth Cox, Upper Stewiacke, N. S.; Leander Crooker, So. Brookfield, N. S.; Clarence FitzRandolp, Bridgetown, N. S.; Stanley B. Fulton, Bass River, N. S.; Geo. B. Hervey, Round Hill, N. S.; J. Lorne Howatt, Charlottetown, P.E.I.; Clifford Hunter, East Florenceville, N. B.; Fred W. Inch, Hampstead, N.B.; Alex. D. Kirkpatrick, Debec, N.B.; Guy Edward Knight, New River, N.B.; Herbert McCharles, Baddeck Bridge; Wm. McCurdy, 73 Coburg Road, Halifax, N. S.; John C. McDougll, Strathlorne, N. S.; Jas. A. McGregor, Lot 16, P.E.I; Arthur McKenzie, Elmsdale, N. S.; Kenneth McLeod, Charlottetown, P. E. I.; Stuart C. Muir, Shelburne, N. S.; Harold H. Nicholl, Mira Gut, C.B.; Robert Parent, Fredericton, R. R. No. 4, N. B.; Frederick Russel Perry, Carleton, N. S.; Hugh Peacock, Bayfield, N. B.; Percy Clare Redding, Lockeport, Shel. Co., N. S.; Melvin Reeves, Kemptville, N.S.; Frederick B. Smith, Truro, N.S.; Webster A. Spinney, Windsor, N.S.; John U Stevens, Kingston, N. S.; Earl J. Vincent, West New Annan, N.S.; Wm. H. Waters, Carter's Pt., N.B.; Kenneth Weldon, Upper Sackville, N.B.; Sydney T. Wyatt, Talc Hall, Coventry, Eng.; Arthur MacKeen, Pictou, N. S.

Passed with certain qualifications: Ulric Arsenault, Charlottetown, P. E. I.; Cedric Bower, Kemptville, N. S.; Russel N. Cochrane, Upper Dorchester, N.B.; Max Ells, Sheffield Mills, N. S.; Clifford A. Miller, Merigomish, N. S.; Harold Newcombe, Port Williams, N. S.; George Walker, Charlottetown, P.E.I.; H. F. S. Lugar, Halifax, N. S.

Truro, N. S.,
April 10th, 1920.

To the Directors of the Maritime Dairy School:

I beg to submit herewith the Financial Statement of the operations of the School for Short Courses recently held.

From an educational standpoint this was the most successful course yet held; especially the "Creamery Course," where thirty men were enrolled and over twenty in regular attendance, and a keen interest was manifest all through the Course.

The attendance for the different years to date has been as follows:

	Creamery	Cheese	Cow Testers
1917	27	12	—
1918	35	18	9
1919	22	9	10
1920	30	9	5

The attendance this year, while not the largest, was by far the most regular and nearly all in attendance stayed for the full course. In former years many only stayed for two or three days.

A number were also in attendance this year that took the course two or three years ago, and gave evidence in tangible form of the value of the former course. One P. E. I. buttermaker telling me of having about $8,000 more butter in 1919 from the same amount of fat by using methods as taught in the School as compared with the methods as used previous to 1917. Scotsburn Creamery made about $18,000 more butter in 1919 by using modern methods than they would have made had they used the same methods as employed in 1915, and this bears true in many other cases in the Maritime Provinces. The regretaable feature, however, is that altogether too many are still using the old methods and the subsequent losses to the country they are serving.

A tremendous work is thus ahead for a Maritime Dairy School. The above figures give some idea from a manufacturing standpoint. From a production standpoint as figures will show they are many times bigger. A conservative basis of figuring, is that if the production from the average cow in the Maritime Provinces could be increased from the present production of about 3,500 lbs. of milk to about 8,000 lbs. milk per year, that it would have meant $48,000,0000.00 more money for the Maritime Dairymen in 1919. The Dairy School seems to be the logical place to drive and push for this increase.

The past few years have been somewhat of an experiment to see if Maritime men would co-operate. The trail was made in a small way, the results are open for criticism. The future is open for what the Maritime men put into it. The School has outlived its present accommodation. The Dairymen of the three provinces and backed by the organized farmers of New Brunswick and Prince Edward Island have by resolution asked for adequate accomodation. The

Gleanings of Agricultural Progress in New Brunswick

AGRICULTURAL EDUCATION FOR OUR YOUNG PEOPLE

(E. P. Bradt, Sec'y for Agriculture.)

Not so many years ago public sentiment did not endorse any effort directed toward providing facilities for giving our young people an opportunity to study agriculture. The idea of a young man spending a few months or years at an agricultural college, to better fit himself for his chosen occupation, was more or less ridiculed. The chances are he would be discouraged on every side from taking up such a course and be told that it was a wholesale waste of time and money. Perhaps some one in the district had taken a course and turned out a failure as a farmer. This instance would be cited as an example of what resulted from a college course, no mention being made of perhaps a dozen others who had taken a similar course and were making a success of farming.

All this in past years has had a discouraging effect and has deterred many a young man from taking advantage of an agricultural training. He feared criticism and ridicule and stayed at home, even though his one great desire had been to prepare and train himself to be a better farmer.

Fortunately, the tide is turning. Our most successful farmers are now strongly supporting every movement that has for its object the training of boys and girls for farm life. They realize that the practical side of farming can only be learned on the farm, but there is something else. The problems of the farmer of today are vastly different and more complex than they were half a century ago. These problems are of a wide variety and many of them not easy of solution. They need trained minds, constructive ideas and a broad outlook, to handle them to the best advantage and to reach a solution that will give agriculture its proper place among the industries of our country. In other words, the idea of the farmer as a citizen, as well as a producer of wealth from old Mother Earth, belongs to the new era.

The Province that does not look after the education of its young people along agricultural lines will fast fall behind in its agricultural development. They will occupy the farms of this province tomorrow. Every effort should be made to provide and equip for this Tomorrow.

The Ministe rof Agriculture, Hon. J. F. Tweeddale, has well looked after the interests of the young people in New Brunswick. The policy of the Department is to start in with the pupils in the Rural Schools through elementary agricultural instruction and to follow up the work after school age with Poultry and Livestock Clubs and, for more mature young men and young owmen, provide Short Courses for a special training in agriculture and domestic science.

The first step is with the boys and girls of school age. To quote the words of Director of Elementary Agricultural Education, Mr. A. C. Gorham, we find these statements:

"It is intended that this course shall be taught in such a way as to interest the pupils in the things about them, to train pupils by not only theoretical studies and formal recitations, but at first by physical, concrete objective exercises, thus stimulating thought and expression connected with locality. We would have the educational system made up of a series of experiences using those things near at hand and belonging to the present rather than the study of remote and ancient practices.

The means for practical education lie more without the school room than within. All the work in the school garden, home garden, study of animal life and plants should be connected with arithmetic, langauge, writing and other subjects. A knowledge of the history and geography of the natural resources and industries of the locality and province is important. This course seeks to make them conversant with these things through constant use and reference. We desire to give practical training in civics, organizing school fairs, forming clubs, conducting debates, holding meetings and practice in speaking from platform as a part of the regular school work in certain grades.

That education might proceed along natural and logical lines the following activities are employed : school gardening, home gardening, poultry raising. Exercises and problems growing out of these are concerned with practical drawing, real business arithmetic and bookkeeping. Also closely related to the subjects of household study and woodwork are a number of others dealing with health, saniitation, ventilation, lighting and heating. The importance of these have long been recognized."

Everyone knows how the interest of the boy and girl is awakened in receiving something that they can call their very own. With this awakened interest comes the opportunity of directing their efforts along well defined channels of usefulness. To accomplish this small packages of seed of approved varieties of grain, vegetables and potatoes have been given free to school children. On this work Mr. Gorham reports as follows:

"With what I have seen and from the reports of the supervisors who visited and socred these home gardens I can safely say that they have been an unqualified success. With free seeds and instructions provided for the making of the plot and sowing of the seed the teacher simply has to demonstrate in the school garden how the plots are to be made to make it clear to the pupils how it should be done at home. The pupil is given printed instructions with this package of seeds and with the guidance of the teacher, if necessary, he interprets these and works out the scheme for himself. It is surprising how well they can interpret these instructions and carry them out sucsessfully. Each pupils feels the responsibility for the success of his or her plot, and thus acquiring real knowledge through experience. They know because they have thought it out and put it into operation."

The next provision made for interesting and training our young people is farming is through Club work. There are at present thirty-six Poultry Clubs in the province, with a membership of 450. This work has been very popular and is creating an interest on the part of our boys and girls in poultry-raising and, at the same time, is a means of introducing excellent bredt-o-lay strains of poultry into the province. It is estimtaed that these young people now have over 8,000 birds of these improved strains. This makes excellent foundation stock from which to spread broadcast over the province eggs for hatching purposes.

The Pig Club work has been equally successful. There are twenty-two Clubs organized, with a membership of 220. Pure bred pigs are owned by the club members. These clubs thus act as sources of high class breeding stock in the province. The quality of the pigs owned by these boys was clearly shown at the provincial exhibitions held last year when club stock carried off the honors in the open classes at each exhibition.

The institution of Short Courses for young farmers was adopted this year. During the month of February courses were held at Moncton and Chatham with an enrollment of twenty-seven at the former and twenty-two at the latter place. The benefit derived from them was not confined to the lectures and practical work in Stock and Seed Judging, but also the opportunity of meeting each other, taking part in debates and thereby developing a broader outlook on life, came as an added advantage. Through the medium of these courses Junior Farmers' Associations have been organized. Meetings will be held throughout the year for social as well as educational purposes.

Arrangements have been made to hold a Potato Growing Competition, where prizes will be awarded to the competitor showing the greatest profit from raising an acre of potatoes. A "Feeding Hogs for Profit" competition is also being held, where each contestant will feed four pigs from the time they are six weeks of age until reaching a weight of from 175 to 200 lbs., prizes being awarded to the one making the largest net profit in the production of pork.

All this work leads up to a desire on the part of these young people for further education and aids in bringing in recruits for the longer established courses at the Agricultural Colleges. It leads up to the point where it should be possible in the near future to get a sufficient number of students for our agricultural schools, which would warrant opening them for regular courses of four or five months' duration. When this time comes it will be necessary to organize the schools and appoint sufficient staff, which, together with the assistance of the general staff of the Department of Agriculture, could put on a course of great value to the young men and girls of rural New Brunswick.

The value of trained men on the farms can not be over-estimated. Farmers are fast taking their place in the affairs of the country. Leadership of the right kind is best developed by starting with the boy or girl and giving them every opportunity to improve their education. This education should be of the kind that develops them for rural leadership, the kind of leadership which, to be effective, requiies a knowledge of the real problems confronting agriculture. No province can afford to deny these opportunities to the younger generation. The Department of Agriculture are fully alive to these needs and are adopting policies to meet them as the requirements arise. Advancement is being made as fast as conditions will warrant and everything will be done to promote the development of agricultural education in New Brunswick and the placing of such an education within the reach of everyone in the province.

SUSSEX COURSES SUCCESSFUL

The classes in Cookery, Millinery and Nursing recently held in Sussex under the auspices of the Women's Institute Division of the Department of Agriculture aroused considerable interest in these subjects, in consideration of which the instructors merit high commendation.

Appreciation is herewith acknowledged of the kindly interest shown in the work by J. D. McKenna, Esq., Messrs. Chas. T. White & Son Ltd., and Mr. S. H. White in providing prizes for the above mentioned classes. Following are the names of the students winning these prizes.

Cookery—Miss Elva I. Morrell.
Millinery—Miss Greta Arnold.
Nursing—Mrs. E. Louise Black.

Following this Course comes the one held in Moncton, the first of its kind ever held in that city. The enthusiasm and interest kindled in the Moncton classes plainly evidences the success following the Women's Institute Short Course in Household Science there.

Here as in Sussex appreciative interest is shown in the work by outside interests in the persons of Messrs. J. A. Marven, Lt., Mr. F. R. Sumner and the T. Eaton Co., Ltd.

The prize winners in this instance are:

Cookery — Miss Muriel Steeves. Moncton.
Millinery—Mrs. D. Murray Condon, Moncton.
Nursing—Miss Alice S. Alward, Moncton.

Concluding their classes at Moncton the Women's Institute Short Couse Staff next turn their attention to Devon. Notwithstanding the busy Easter season, the holiday attractions the classes are well attended and enthusiastic interest is shown throughout the Course.

Business men of Devon are not a bit behind those of other towns of New Brunswick. Appreciation of the work done is shown by Mayor Henry, W. D. Gunter, Esq., and Stanley Douglas, Esq., in providing prizes for the Cookery, Millinery and Nursing classes respectively. The prize winners are:

Cookery—Miss Greta Young.
Millinery—Mrs. David Coombes.
Nursing—Mrs. E. M. Young.

The itinerary of the Women's Institute Short Course in Household Science for 1920 held in English speaking districts is as follows:

Sussex—March 2-12.
Moncton—March 16-26.
Devon—March 30-April 9.
Perth—March 13-23.
Chatham—April 27-May 7.
Bathurst—May 11-21.
St. Stephen—May 25-June 4.

Further announcement regarding these Courses as well as those to be held in French speaking districts will be given later.

HAZEL McCAIN,
Supervisor.

CARLETON COUNTY HOLSTEIN BREEDERS ORGANIZE

On Sturday, April 10th, a representative group of Carleton County Holstein breders met in the Vocational School, Woodstock, for the purpose of organizing a breeders' club. The chairman of the meeting, Mr. R. W. Maxwell, Director of the Vocational School outlined the objects of the proposed club, which are as follows: The promotion of good fellowship amongst its members and the advancement of the general interests of the Holstein-Friesian breed of cattle by the holding of public sales at auction, by encouraging the entry of cows and heifers in the advanced registry, discussion of the best methods of breeding, rearing and exhibiting and raising the standard of excellence of the breed by bringing before the public the good qualities and exceptional merits of the breed, and in other ways to generally widen and extend the interests of this breed of cattle by acting in unison upon all occasions which demand it, and by establishing a reputation for Carleton County as a centre for high class Holstein cattle. The aims of the club were endorsed by all present, and the meeting was then opened for the election of officers. The following officers were elected:

President—H. Lindsay.
Vice-President—J. Purvis.
Sec'y-Treas.—R. W. Maxwell.
Directors—W. P. Hale, H. B. Hemphill, G. S. Peabody, F. Brown, C. L. Smith, W. L. Carr.
Honorary Director—J. H. Hoyt, District Representative of the Department of Agriculture.

A formidable set of By-Laws was adopted. Althugh membership re-

(Continued on page 554)

Fifteenth Annual Meeting of N. B. Fruit Growers' Association

Report of Sec'y-Treasurer

Mr. President and Members:

I beg leave to submit my report, which is divided into two parts, the first part dealing with the secretarial and general work of the Association, and the second part comprising the financial statement.

Your Association is again able to report another year of increased membership and service, in fact, the most active, useful and promising year of its existence. The members totalled 174 as compared with 128 in 1918 and 151 in 1917—and we hope to reach the 200 mark this year—an accomplishment of no mean proportions in view of the conditions and in comparison with the activities of other assocation whose field of recruiting is very much larger.

The Association continued the work of supplying its members with nursery stock, spraying matreials and all kinds of supplies, the volume of this business showing a 35% increase over that of 1918. Just a word here in regard to this supply business. From a purely personal and selfish standpoint, I would prefer to be relieved of the extra work, etc., entailed in handling the supplies but I do not think it would be good business for the Association to give it up, as to do so, would in my opinion rob the Association of much of its usefulness and remove one of the strong factors in maintaining and increasing the interest and membership. You may now be able to buy your supplies as cheap elsewhere, though I very much doubt if you can obtain them any chaper—but stick to the old firm and support your own organization—the one that was giving you this service long before others entered the field and by competition forced other sources of supply to lower their prices.

Our financial position continues satisfactory—the bank balance of Ootober 31st, 1919, plus the excess of assets over liabilities showing approximately $1,519.18 to our credit. This substantial balance is essential to the most advantageous purchase of supplies and the carrying on of our general business since, of necessity, one-half or more of our assets is, at times, in the form of outstanding accounts and supplies carried in store.

At the last annual meeting a resolution was passed requesting that the Association be incorporated under special Charter of the Legislature, and that an annual grant in keeping with the importance of the industry which this Association represents be accorded to it. This resolution was brought to the attention of the Honourable J. F. Tweeddale, Minister of Agriculture, who promptly introduced and secured the passage of a bill incorporating the New Brunswick Fruit Growers' Association, at the session of the Legislature then sitting, and also appropriated for it a grant of $200.00. The immediate and favorable action of the Honourable Mr. Tweeddale on this resolution is much appreciated by the fruit-growing interests of the province.

In my report for 1918, I suggested the holding of a "Sunny Field Meeting," and thih idea was unanimously endorsed by a resolutoin requesting the Department to lend all possible assitance. Accordingly the first Orchard Field Day was arranged and held on August 28th. Prominent members of the Fredericton Board of Trade and others kindly placed their cars at our disposal, thus making such a trip possible and the fruit growers feel much indebted to those gentlmen for their kindness. The cars assembled at the office of the Department of Agriculture shortly after 9 o'clock and proceeded across the river to the large Duchess orchard of Mr. Robert Tomilson in North Devon, where Mr. C. A. Parker, Packing Expert, gave a demonstration of grading and barrel packing, and Dominion Fruit Inspector W. S. Potts, of St. John, explained the requirements of the Fruit Marks Act. The next stop was at the Dominion Experimental Farm, where the party enjoyed a very substantial luncheon and afterwards inspected the young commercial and variety test orchards which were looking very well indeed, and just beginning to bear. Many thanks are due to the Supt., Mr. W. W. Hubbard and his staff for doing so much to make the day a success. The next stop was at Burton, where the party looked over the nurseries and orchards of the St. John River Valley Fruit and Farm Land Company and listened to a talk on growing nursery stock by the Manager, Mr. R. A. Fillmore. The Duchess and Wealthy fillers in this eight year old orchard were heavily loaded with beautiful fruit and well worth seeing. Proceeding the party observed in passing the large orchards of R. D. W. and W. W. Hubbard and R. S. Barker, also at Burton, and followed the river through Upper Gagetown to Lower Gagetown, where the final stop was made at the adjoining orchards of W. P. and F. L. Fox and the Cossar Farm. The Fox orchard was a splendid example of the results of good care, the trees being in strong vigorous condition, well sprayed and loaded with fine large clean fruit to the extent of more than one thousand barrelss. Mr. G. E. Sanders, of the Dominion Entomological Branch, explained the spraying experiments conducted in this orchard by his staff and pointed out the difference in the results. The schedule of the trip was concluded by inspection of the still larger orchards on the Cossar farm, where the practise of good methods of culture was evident in the abundant crop, upwards of fifteen hundred barrels of apples being on the trees.

About one hundred fruit growers and their interested friends enjoyed the outing and profited by what they saw and heard in the different orchards visited. Everybody was delighted with the scenic beauty along the St. John river and the fine possibilities in orcharding which the trip disclosed, well satisfied with the courteous treatment accorded them, and looking forward to a similar profitable and delightful outing next year. The St. John Board of Trade, owners of the Demonstration Orchard at Browns Flats, sent a strong delegation and there were fruit growing representatvs from the counties of Carleton, Charlotte, St. John, Kings, Queens, Sunbury, York and Westmorland. Before this meetnig adjourns I would like to hear a discussion on the advisability of holding a Summer Field Day again this year. Shall we make it an annual event?

Your Association, acting with the assistance of the oHrticultural Division of the Department of Agriculture, contnued the co-operative shipment of apples with marked success and marketed nearly two thousand barrels, with the highest net returns ever received for New Brunswick apples. This work, which we started in 1917, has increased rapidly and is popular with the growers. As I expect to refer to it somewhat in detail at the evening session I will not give further time to it now.

The Barrel situation was again decidedly unsatisfactory, the supply being unsatisfactory and uncertain and the price high. While some barrels were secured earlier in the season for 48 and 60 cents delivered, the price for the main supply was from 75 to 80 cents. While the barrels from Woodstock were good and those from Ontario fair, much dissatisfaction was expressed with the St. John barrels, but neverthelesss growers felt lucky to get sufficint barrels to handle their crop even though the quality was inferior. I am informed that the barrel factory at Oromocto, owing to the disastrous fire of last September, will not be able to make any barrels this year until some time in the fall. In view of this and other conditions, I think the Association should consider the immediate placing of a contract for its minimum requirementss, at least.

Snce the small fruit industry is of such proportions that it annually requires from one-half to three-quarters of a million boxes and thousands of crates, there would seem to be no good reason why these packages should not be made in New Brunswick from our own wood and by our own people. Action towards this end is under considration. If this could b done it would largely solve the question of a uniform box and crate.

I would direct your attention to the question of subscribing to "The Canadian Horticulturist." If the Association subscribes for its members in a body the subscription price for each member will be forty cents. While I would very much like to see this paper going regularly to all our members I do not think that the Association should accept the proposition unless the membership fee is raised to $1.50 so as to cover the subscription price.

I am sure that all our members will join with me in extending their heartest congratulatons to Mr. C. W. Baxter, on his appointment to the position of Dominion Fruit Commissionr, an appointment which was all the more acceptable since it embodied a practical recognition of the principle of "Promotion within the Service." We have every confidence in Mr. Baxter's ability and his sense of fair dealing to all to feel assured of the most hearty sympathy and co-operation of himself and his staff in our work. We have not been backward in calling on them for assistonce and we do not intend to be so. Should we, at times, appear to be too persistent, or somewhat unreasonable in our requests, it may be said in extenuation that we have all the enthusiasm of pioneers with aspirations and dreams of future greatness for New Brunswick as a fruit growing province.

The determination of the prospects for apple growing in Canada or in any of its several provinces involves a consideration of the conditions and prospects of the industry in the United States. In this connection we cannot do better than quoto the United States Department of Agriculture which in a special publication entitled, "The Commercial Apple Industry in the United States," prepared in 1918 by J. C. Folger, Fruit Crop Specialist, of the Bureau of Crop Estimates, says under the heading of "Future of the Apple Industry":

"Apple production does not respond quickly to supply and demand, and for this reason there has been more or less stability in the matter of prices. It requires several years for trees to come into full bearing, and over prodution as the result of excessive planting is not felt for a considerable period. There seems no reason to believe that over a period of years, taking the good with the bad, apple acreage as a whole will make any materially better returns than the average farm crop, yet apples will always afford better opportunty for individual efforts of the excxeptional grower.

Aside from the possibility of certain "boom develepoments" and the planting of unsuitable land, there seem many reasons for viewing the future of the apple industry as promising. In speculating upon future production, one instinctively turns to New York State. Unquestionably, western New York State is approaching its maximum production. The Hudson Valley includes many new orchards, but in the more important parts of western New York, the average orchard is more than 40 years old. Nowhere in the Eastern States with the exception of the Shenandoah —Cumberland region, does there seem likely to be any material increase in production. Many of the old trees all through the east are dying out. On the other hand, the Pacific Northwest can be expected to show a constantly increasing production for several years. A very large percentage of the new planting in the decade 1900-1910 occurred in the Northwest. These plantings are to a large extent commercial. Taking the United tSates as a whole, there has been very little planting in any locality since 1910. It would therefore not sem improbable that this lack of planting will have a pronounced effect, beginning about 1925, if not sooner.

With the cessation of war, the export markets, which normally furnish an outlet for approximately 10 per cent. of the United States commercial crop, will be opened. The probable extension of foreign markets will increase this percentage. While a moderate increase in apple production seems probable, the increase in population and the movement toward the cities are factors likely to increase consumption very materially. Furthermore, the improved marketable quality of commercial apples is unquestionably stimulating the demand for this fruit among all classes. Better means of distribution and wider use of the apple combine to give a decidedly hopeful outlook to the commercial apple industry."

Coming to Canada we find an increased production in British Columbia but not sufficient to have any marked influence on the situation; a practically stationary production in Nova Scotia; and a decrease production in Ontario and Quebec.

Speaking of the apple industry in Ontario, in the October issue of the Canadian Horticulturist, Professor J. W. Crowe, said, "The depletion of our apple orchards has been so serious that Ontario will soon be reduced to the necessity of importing apples to meet our home requirements. Our orchards have not been taken care of as they should have been, and many of them are rapidly dying out. This condition existed even previous to the war, and during the past five years has been intensified by the shortage of labor. Possibly not over 1 per cent. of the orchards of the province have been given proper attention during the past few years. Added to all this the heavy freeze the winter before last has had a disastrous effect. In Northumberland Co., which is one of the heaviest apple producing sections in Ontario, I am informed that 50 per cent. of the apple orchards have been destroyed. The loss among even the better cared for orchards runs as high as 30 per cent. There is no reason to believe that conditions in Northumberland county are exceptional. It is evident from this that the industry has suffered a severe blow and that many years will be required before normal production will be restored."

In the province of Quebec, the situation is far worse for a recent census of apple trees there showed a loss of approximately 1,000,000 trees since 1911, or nearly one-half the bearing trees. This was largely due to the severe winter of 1917-18, but the cause went further back than that as many orchards were dying through old age and neglect previous to that winter. As yet, this great loss is not being replaced by new plantings.

In Europe the orchard situation is extremely backward, having suffered heavily from the war. The bearing trees have been neglected and are ruined in the war area, and in great areas where the actual fighting did not take place they have been very much neglected.

In 1918, following one of the most severe winters on record, our orchards appeared to have sustained but little permanent injury, notwithstanding the fact that heavy winter killing and injury resulted in sections hitherto considered more favorable for apple growing than New Brunswick. This judgment of light injury to our orchards was confirmed this year, when those trees and varieties which showed signs of injury from the winter of 1917 and 1918, could not be detected from the others —blooming and bearing equally as well and looking vigorous. We are now able to say that the damage to apple trees in this province from the the winter of 1917 and 1918 was remarkably light and the recovery as complete as could be required, in marked contrast to Quebec, Maine and Eastern Ontario where very extensive damage was reported in the summer of 1918 and where many trees that lived through that summer succumbed to last winter, though it was mild and favorable.

The foregoing facts indicate that this is inded an opportune time to extend the plantings of apples in New Brunswick. The experience of recent years in this province has demonstrated that commercial production of high quality apples that are in good demand on a variety of markets is practicable and frought with no greater dangers than in many other apple sections of the Dominion. The ability of our growers to realize top prices for their apples on the largest competitive market in Canada (Montreal), and to do that practically at the first attempt, has added greatly to their confidence in their ability to grow good apples from long established fruit growing sections, hitherto considered as more favorably adapted.

It is highly probable that the price of apples will never get back to prewar levels. In the great neglect of European orchards, the shortage of seedling stock, increased prices for everything and the decreasing conditions of the orchards in Quebec, Ontario and parts of the eastern United States, lies the opportunity of the present for the enterprising fruit grower in New Brunswick and Eastern Canada—in contrast to the bogey of over production preached so often a decade ago.

It is somewhat early as yet to say how our orchards have wintered, particularly as to the condition of the fruit buds but following the heavy crop of 1919 it is probable that the crop will be considerably lighter, although the coming into bearing of young orchards may offset this to some extent. We should, however, give our orchards the best attention possible, with the object, not only of gettig the best returns this year, but of preparing to secure the fullest possible returns from a larger crop in 1921.

The last month concluded my tenth years as Secretary of this Association and also as Provincial Horticulturist and I am happy to say that from every point of view, it was the most successful and encouraging since I came to the province. The building up of scattered elements of fruit growing into a real fruit growing industry is not a problem capable of easy or early solution or productive of spectacular results—but it is a thing that once acomplished, adds, one might almost say, forever to a country's hapipness and prosperity, and be he or she who plays a part in such a work, as the members of this Association are doing will in this respect, at least, have served their country well. We have made good substantial progress—we have got many of our older orchards into better shape and we have established some fine new commercial orchards which may be likened to the first layer of brick in the new factory, resting on the foundation of our older orchards.

You have done much—but there is much more to be done and every reason and encouragement to carry on with increased effort and enthusiasm.

BUYING BEES IN COMBLESS PACKAGES

(Experimental Farms Note)

During the past few years a popular way to make good the winter losses of bees, and even to make a start in beekeeping, has been to purchase a pound or two of bees with a queen in spring, shipped from a specialist in the Southern States by express, and more recently by parcel post also.

From experimental shipments received at the Central Experimental Farm, Ottawa, during the past four years, and from enquiries amongst beekeepers in other places who have received them, it can be said that this method of obtaining bees should be followed with caution.

At Ottawa, the best results were obtained in 1917, when three two-pound lots with young fertile queens arrived by express in good condition from an experienced shipper in Alabama, after having been seven days on the journey, on May 9, a week before the honey-flow from dandelion commenced. These bees, on arrival, were given combs containing a little old honey. The spring having been favourable for breeding, they quickly developed into strong colonies, and each gave about as much honey as the average wintered colony.

But later experiments and investigations have shown that it is far too much to expect such good results every year, and that several accidents are likely to happen that may make this method of acquiring bees anything but profitable.

In the first place, bees are very perishable. Several shipments by express in April and May, 1918, from the above mentioned dealer, arrived nearly all dead eleven days after despatch, but another shipment received by parcel post on April 28, 1919, arrived in good condition only four days after despatch. Heavy losses both by express and parcel post have occasionally been reported.

Moreover, the journey often injures the queens, so that they are liable to do poor work, or to die soon after arrival. This misfortune was mainly instrumental in spoiling the results in 1919 from six lots received in good condition by parcel post from the same breeder. They together produced only 282 pounds of honey, while each wintered colony gave 187 pounds, two of the queens having died a day or two after arrival, and two more having been superseded a week or two later. A short breeding season before the honey flow contributed to these poor results.

The sender, owing to a rush of orders or unexpected unfavourable weather, may be unable to supply the bees until the summer, after the season has gone, and one or two instances have occurred of bee diseases having been introduced by bees from the south. However, postal regulations are now in force in both countries forbidding the bees sent by parcel post to be accompanied by combs, which will help to remove the risk of the transmission of foul-brood.

So great has been the demand for these southern bees in recent springs, that inexperienced dealers have arisen who have shipped them in boxes unsuitably constructed and provisioned, and sometimes with too many bees in the box, resulting in heavy loss. A few unprincipled dealers have also appeared who have sent old bees or too large a proportion of drone bees, or virgin instead of fertile queens. One may expect, however, that as the trade in these southern bees becomes more stabilized, and after the transportation employees become accustomed to recognize the very perishable nature of this merchandise, the losses will be less frequent.

On the whole, we would advise beginners to buy bees locally in preference to getting them early from the south, particularly because in the latter case, combs and expert care are needed. We also think that, at the present high price of bees and unfavourable rate of exchange with the United States, those who have bees will pay better to make from their own bees by breeding queens and prepare them with extra good care for the winter than to depend on purchasing bees from the south in spring. Those who wish to try the experiment of buying bees from the south for the first time, could protect themselves by ordering only a few pacakges and noting in what condition they arrive before ordering more. It is advisable also to order from reliable dealers some weeks or months before the bees are wanted.

There is no customs duty on bees entering Canada, but an entry for customs returns, which usually causes little or no delay, is required.

Most of the objections to procuring combless packages of bees from the south in early spring are overcome by getting them from the warmer parts of Canada later on in the season. Several Canadian firms are now supplying these, and beginners can make a fair start by obtaining one or two of these lots in June or early July, without having to buy combs.

F. W. L. SLADEN, Apiarist

DUSTING APPLES

In view of the fact that between 200 and 300 dusting machines will be in operations in the Annapolis Valley this season it seems best to outline what seems to be the best programme for the season.

For those who are going to use 90-10 sulphur lead arsenate dust we have the following advice: Apply the dust in the early morning when the air is still, and the plants wet with dew. Apply enough dust, 75 pounds per acre per application on 20-25 foot trees. You cannot get results without using enough material. If possible space your dusts a little closer together than liquid sprays, applying five dusts during the same period as you apply four sprays.

Some will use the new copper-arsenic dust on all four applications on account of their preference for Bordeaux, anl also for economy. This advice regarding the application of sulphur dust applies to copper-arsenic dust excepting that 50 pounds of copper-arsenic dust per acre per application is enough for 20-25 foot trees. If the copper-arsenic dust is used on the third or calyx application about half as much russeting of the fruit will result as results from the use of Thompson Bordeaux. If one wishes to avoid this russeting, and it is worth while avoiding it, one can use 90-10 sulphur lead arsenate dust for the calyx application, and the copper-arsenic dust for the remaining applications.

Important things to note in ordering dust are:

Copper-arsenate dust costs $1.00 per hundred less than 90-10 sulphur lead arsenate dust.

In using copper-arsenic dust 50 pounds per acre per application is enough for the average orchard.

In using 90-10 sulphur lead arsenate dust 75 pounds per acre per application is enough for the average orchard.

Order enough dust for four or five heavy applications and use all of it.

In former days when dust was expensive we could not reasonably blame people for being saving of it. During the past year we have worked hard in order to lower the cost of dusting material, thereby getting into many rows with spray firms, etc. Now that we have got the material down to a low price do not skimp on it and then blame dusting for the results of stinginess.—By G. E. Sanders, Dominion Entomological Laboratory, Annapolis Royal, N. S.

SPRING PRUNING

(Experimental Farms Note)

If pruning is to be done this spring see that it is completed before the sap is flowing to any extent. Do not think it is necessary to take out a lot of wood from every tree. Much damage may be done by annual butchering. If the orchard has light annual pruning it will only be necessary to (1) remove all the dead or broken branches, (2) to head in any branches which may be too rangy, (3) to remove cross branches or (4) to thin out fhere the tree hos become absolutely too thick.

If the orchard is old and hs been neglected, which is evidenced by lack of growth and barren arms for many feet from the main trunk, a vigorous heading back of the top is necessary to force ou new growth from which new fruit-producing wood can be selected.

Handle the young trees carefully. Do not make it a practice to head back one-half or one-third annually. Watch the crotches and always keep one branch in the lead to avoid weak crotches.g Cut out where the branches are too close together to keep the tre headed low, and if the variety produces a long rangy tree suppress the strongest growing branches the most and the weakest the least.

Points to Remember

In cutting back a main branch and one of its strong growing laterals do not cut both to the same length. Permit the main branch to retain the lead, otherwise two branches of equal dimensions will result which will produce a very weak crotch; a constant source of trouble.

Whenever given the option of selecting either a branch growing at a sharp angle to its parent or one growing almost at right angles, choose the latter—it will make a stronger crotch in future years.

Always cut back to a bud, cutting as close as possible without injuring the bud itself. By paying attention to the position of the bud one can do much to decide the form the tree shall take.

Study each variety you are dealing with and adopt a system most suited to its needs. Do not attempt to apply very hard and fast rules to your whole orchard.

It is not a question of how much pruning one cand do, but how little one can do and still retain the desired shape, vigor and productiveness of the tree.—M. B. Davis, Pomologist,

Spraying the 1920 Apple Crop in Nova Scotia

(By G. E. Sanders, Dominion Entomological Laboratory, Annapolis.. Royal, Nova Scotia)

It seems to be the opinion of growers that the apple trees are well loaded with blossom buds, and though indications are that we will have more than the average quantity of blossoms yet there seems every probability that the blossoms will be weaker than usual for the three following reasons: First, the large crop of 1919 undoubtedly reduced the vitality of the tress somewhat. Second, the frosts of October, 1919, caused the leaves to drop some weeks earlier than usual, thus weakening the buds. Third, the extreme low temperatures of the past winter have, in the opinion of many orchardists, lowered the vitality of the buds of many varieties.

With the prospect of a fairly heavy but weak bloom, the orchardists should take steps to correct the weakness and guard against injury so far as is in their power.

It is a well known fact that the more pollen is distributed to the petals of the apple blossoms, the better the set of fruit wil be. The amount of pollen that is needed tto set a crop varies with the vitality of the trees. It would appear therefore that we will need the maximum quantity of pollilation in 1920 or we shall need the maximum quantity of domestic bees, for bees are the most useful pollinizers among insects. Domestic bees are now very scarce in the Annapolis Valley and it is worth while for every orchardist to obtain a hive or so of bees for use in his orchard during the blossoming season of 1920.

The use of stimulating fertilizer about apple trees just as the buds are bursting or before the blossoms, has a great eeffct in strengthening the trees and so causing blossoms to set that would otherwise drop.

Probably the most important thing to consider this year is the spraying material. We must use only sprays that we know will not weaken the leaves and blossoms and cause fruit removal. Therefore, we should avoid the use of lime sulphur on apples. We should use sprays that are known not to cause leaf injury or fruit removal. That we must spray in order to insure a crop, we know from the season of 1913, when those who sprayed before the blossoms had full crops while those who did noot, had practically all of their blossoms and sets removed by apple scab. In 1919 we very narrowly escaped the same state of affairs, but the scab starting a little later gave those who neglected pre blossom spraying, a very dirty crop instead of no crop.

The 1919 spray calendar has proved to be almost perfect for Nova Scotia conditions, both in insect and in fungus control and freedom from russetting and fruit removal. The formulas given below are those advocated.

First spray when leaves are the size of a ten cent piece.—3-10-40 Bordeaux, 1 pound arsenate of lime to 40 gallons of water.

Second spray when blossoms are showing pink.—2-10-40 Bordeaux, 1 pound arsenate of lime to 40 gallons of water.

Third spray when petals fall.—1 lb. soluble sulphur, ½ lb. arsenate of lime, 5 pounds hydrated lime to 40 gallons of water.

Fourth spray two weeks after the blossoms fall.—2-10-40 Bordeaux, 1 pound arsenate of lime to 40 gallons of water.

The United Fruit Companies have this year laid in a full supply of finely crystalized copper sulphate and hydrated lime so that growers can make their Bordeaux by the quick method and so handle only dry materials in mixing. The quick method is to weigh out the proper quantity of finely srystalized copper sulphate and put it either in the strainer or in the spray tank before starting to fill with water. Either run the water in over the copper sulphate in the strainer or keep the agitator running while filling if the material is in the tank. When the tank is about three quarters full dump in the hydrated lime. The agitator mlst be running rapidly when the lime is added in order to distribute it thoroughly before it dissolves, so giving the eect of mixing dilute solutions together. Last of all the poison should be added.

In orchards or on varieties very susceptible to apple scab it might be best to make the second and fourth application of spray 3-10-40 instead of 2-10-40 Bordeaux. Better scab conrol will result and the increased amount of russeting will be negligible. One of the most important points in making Bordeaux for the apple is always to use at least three times as much lime as copper sulphate. This eliminates danger of foliage yellowing such as we used to get from the use of such formulas 4-4-40 Bordeaux.

More bees, the use of stimulating fertilizer, and careful spraying following the 1919 spray calendar, are necessary in order to offset the effects of the large crop of last season; the early frost of last faal and the low temperatures of the past winter.

CLUB ROOT OF TURNIPS, CABBAGE, ETC.

Club root of turnip and related plants causes a considerable loss in the astern provinces. Diseased roots are greatly swolen, distorted and sometimes rotted. Once established the disease remains in the soil indefinitely unless precautionary measures are taken.

Control.—If the following precautionary practices are adopted the disease can be greatly reduced if not completely controlled:

1.—Plant only on disease free soil. A comparatively new piece of land which has never been planted with turnips, cabbage, rape, etc., and which hence may be regarded to be absolutely free from disease is desirable. Under no circumstances use a field which has previously produced a club-rooot infected crop unless it has been heaviy limed and the lime has had three or four years in which to free the soil of the organism.

2.—Liming is a good practice. Considerable benefit may be secured by applying three tons of air slaked lime or five tons of ground limestone any time before planting the crop; but the best results are obtained when the lime is applied immediately after the diseased crop has been harvested and a period of three or four years allowed to elapse before turnips or cabbages are again planted. Liming will not only control club-rooot but turnips and cabbages do better on soils rich in lime than where lime is lacking. Acid reacting fertilizers encourage the disease.

3.—Manure:—Manure from stock fed on club-rooted turnips should not be used as it invariably carries the disease and infects the soil to which it is applied. Where possible it is good practice to apply to the turnip crop only such manure as comes from stables where tyrnips have not been fed at all.

Rotation and Sanitation—Plant susceptible crops on the same soil not oftener than once in eight years. Destroy all diseased roots or boil them before feeding. Keep down all weeds of the mustard family. Raise cabbage and cauliflower seedlings on disease free soil and never throw infected soil from seedling boxes where it may be spread to clean fields.—G. C. Cunningham, Pathologist for Root and Vegetable Crops.

Cold Stores for Maritime Provinces

Delegates From Maritimes Given Fine Reception-- All Maritime Province Members Pressed for Favorable Reply

The delegation from the Maritime Stock Breeders Association and the N. B. Farmers and Dairymen's association which went to Ottawa to press for further cold storage facilities for the Maritime Provinces, accomplished much. Every member of the federal house from the Maritime Provinces was asked to give support to the petition of the delegation, and when the representatives of the east met in Hon. Dr. Tolmie's room, it looked as if a big step had been taken to bring about Maritime Province union. Never has a more representative gathering been present to urge any policy on the Dominion givernment, so far as Eastern Canada is concerned.

The delegates were M. E. A. Trites, Salisbury; Mr. Fred Fuller, Truro; Mr. C. W. Alward, Havelock and Mr. J. D. McKenna, of the Maritime Farmer, Sussex. Backing them up in their demand for cold storage facilities were: Hon. A. K. McLean, Halifax, Messrs. Stanley Elkin, St. John, Pius Michaud, Madawaska; Leger, Kent; Copp, Westmorland; Loggie, Northumberland; General McLean, Royal; Sinclair, Queens, P. E. I.; Turgeon, Gloucester. Messrs. Davidson and Chipman were present from the Halifax and Amherst boards of trade, respectively.

The whole question of cold stores was carefully considered from a national standpoint and Hon. Dr. Tolmie gave every assurance of his sympathy with the petition, and expressed his opinion as recognizing the need for cold storage. At the suggestion of the Minister of Agriculture, a committee consisting of Messrs. McLean, McCurdy, Copp, Leger, Elkin and Sinclair was appointed to act with Dr. Tolmie in pressing the question to a successful conclusion. Later the delegation saw Sir George Foster, acting premier, and Hon. Dr. Reid, minister of railways, and placed the views of the Maritime Provinces before them. The delegates received a most attentive hearing and are confident that something of a definite character will result. Hon. Dr. Tolmie announced that he would later confer with the ministers of agriculture of the three provinces in regard to abattoir facilities in the Maritime Provinces.

Mr. Harvey Mitchell Retires

The name "Harvey Mitchell' has been so closely linked with dairying progress in the Maritime Provinces during the past twenty-six years that it is almost a household word. The Maritime Farmer ventures to say that if any resident of the Maritime Provinces were asked to name the foremost figure in the dairy interests of Eastern Canada during the past quarter of a century the reply would invariably be "Harvey Mitchell."

In 1894 Mr. Mitchell joined the staff of the New Brunswick Department of Agriculture as Dairy Superintendent, which position he efficiently filled until 1907, when he became Maritime Representative of the Dairy Division, Ottawa, with the three Maritime Provinces for his field of action.

In 1896 he introduced the co-operative plan of operating cheese factories and creameries in New Brunswick also the division of proceeds according to percentage of butter fat. Previous to this the milk was practically all bought outright and paid for at a stated price per one hundred pounds, regardless of fat content.

On becoming Maritime Representative of the Dairy Division in 1907 he introduced Cow Testing for the improvement of Dairy herds in his territory. From 1907 until 1916 he continued to supervise Cow Testing in Nova Scotia, New Brunswick and Prince Edward Island, a work that has made splendid growth and wonderfully helped to set the dairymen in the right track, teaching them how to track the robber cow, eliminate her from the herd and at the same time discover and perpetuate the profitable cow. During this period Mr. Mitchell assisted in the establishment of central creameries in Nova Scotia and Prince Edward Island. The years 1915-16 were spent in carrying out a special propaganda for an improvement in the quality of Prince Edward Island cheese. The object lessons taught by Mr. Mitchell while carrying on this campaign have been conducive of the desired effects. No one conversant with the splendid showing made in 1915 and 1916 at the Charlottetown Exhbition could fail to note the interest that Mr. Mitchell's propaganda aroused and the hearty co-operation he received.

In 1917 Mr. Mitchell carried the gospel of the necessity for manufacturing a better class of cheese to the cheese makers, factory owners and patrons of cheese factories in New Brunswick. New Brunswick cheese had become a by-word not for excellence in the vocabulary of cheese buyers. The New Brunswick cheese manufacturers fell in line and by following Mr. Mitchell's advice there was soon a decided improvement in quality and an improved system of marketing was introduced. During these years Mr. Mitchell also helped very materially in establishing central creameries at Moncton and St. Hilaire, N. B.

On March 31st of this year, Mr. Mitchell severed his connection with the Federal Dairy Division to give more attention to his private affairs, or as he humorously says: "I went away back and sat down where I will be always glad to meet any of the boys."

Mr. Mitchell has always been a boy with the boys and they too will always be glad to see him. His advice on dairy matters was always sound and not only the local department of Agriculture but also the Federal Department found in him an advisor on dairy matters of sound judgment. Many of the men who manage Maritime Province cheese factories and creameries received their instructions from Mr. Mitchell. These are the men who were closely allied with him in his line of work for dairy advancement and it is they who best appreciate what Harvey Mitchell has meant to our dairy industry.

STRAWBERRY PLANTS FOR 1920

Manning K. Ells, the strawberry plant and berry grower of Port Williams, Nova Scotia, who has been supplying thousands of reliable plants to the berry growers of the Maritime Provinces for several years, and whose shipment of berries from his own farm proves that he has the right goods to sell, has issued his 1920 catalogue. Intending growers, as well as others who may wish to re plant, will find Mr. Ells reliable in his dealings. Ask for his catalogue. Mr. Ells will help you to get a good start in strawberry growing.

BANGING THE MARITIME FARMER

Thousands of dollars are being spent in Winnipeg to discredit the Maritime Farmer. The expose of the exploitation of the farmers of Ontario in the matter of the sale of seeds. The big savings that have resulted to farmers through the conduct of the Maritime Farmer's co-operative branch, and the refusal of this paper to sell itself to do the bidding of Winnipeg are sore spots with the Winnipeg management of the political campaign,through which it is hoped to tie up the farmers of the Maritime Provinces in support of the ideals of "Western Farmers." During the past week or two this paper has received a number of letters from various parts of the Maritime Provinces, and strange to relate, they are all in the same language. They have the same reasons for disagreeing with the Maritime Farmer, clearly proving that somebody centrally located had been advising these farmers what to say and how to say it. One of the strong points made against this paper is that it opposes the handling of wheat by the government unless products of the farms of the Maritime Provinces are given similar treatment. That is one point on which all the letters centre. Doesn't it look as if Winnipeg was at work again?

And then, the Maritime Farmer gets pretty roughly rapped over the knuckles for daring to stick up for six dollars and a half per barrel potatoes. Some of these letter writers get very much excited because the Maritime Farmer does not believe that the farmers of the Maritime Provinces are making too much money already. We are invited to support the farmer of the West in his raid on the treasury for wheat marketing, but we are told that we are crazy to think of calling for a fair deal for the potato growers of Carleton and Victoria, or the dairy producers of the other counties of the Maritime Provinces. The Maritime Farmer does not propose to make any apology. When it comes to a question of holding up the price of spuds, butter, cheese, eggs, etc., we are out for the same treatment of the East as the West gets. Who started this special privilege stuff, anyway? Was it the farmers of the east that first asked for any government funds to handle their produce? All the Maritime Farmer wants is a fair deal all round and we make no bones as to where we stand. Despite the letters directed from Winnipeg through various channels, we are not ashamed to speak out for a square deal for the potato grower of the East. Let Winnipeg rave away, say we.

CANADA'S LATEST AYRSHIRE IMPORTATION

The Donaldson Liner, Cabotia, landed at St. John, N. B., on April 8th, with a large importation of live stock for different parts of Canada. Included in this importation was a consignment of Ayrshire cattle and Clydesdale horses for R. R. Ness & Sons, Howick, Que. The consignment of horses was made up of two Clydesdale fillies and a two year old colt by "Signet". The consignment of Ayrshires represented, 10 yearling bulls, 1 two year old bull, 25 yearling heifers and 1 two year old heifer.

This consignment of Ayrshires represents one of the best importations that has ever left the other side. They were personally selected from the best herds in Scotland by R. R. Ness, who spent February and March visiting the large Ayrshire auction sales and he also visited many breeders.

The most notable purchase was "Hobsland Victory", from John Mackie of Dalfibble. Mr. Ness has been trying to secure this great sire for sometime, and finally succeeded in landing him at $5000.00. He is being retained until July by Mr. Mackie to do a season's breeding. He is an animal of outstanding merit both from the point of individual excellence and in respert of the milk records in his pedigrees. His sire was the great breeding bull "Netherhall Keystone" (14699), and he is out of "Hobsland Jean 5th", the great breeding cow sired by "Hobsland Masterpiece". Her record for her first lactation was 11,250 lbs. milk testing 3.97% butter fat. At the Hobsland Sale, this year, her calf "Hobsland Mendel" sold for $9000.00. "Holsland Victory" is to be retained in the Ness herd permanently as a herd sire.

Another splendid individual is the two year old bull "Kelloch Volunteer". His sire, "Netheron Viceroy" is by the great breeding and show bull "Brae Rising Star", who has seven A. R. daughters in America, which averaged 9,820 lbs. milk and 398 lbs. fat. The dam of "Killoch Volunteer" is a big strong cow with a large record.

"Hobsland Guide", a yearling bull, was bought at the Hobsland Sale. This bull is to be retained also as a herd sire at BURNSIDE. He is by "Hobsland Scotland's Best", whose dam is "Hobsland Jean 5th", by Masterpiece. Her record is 11,250 lbs. milk testing 3.97% fat. Guide is out of "Hobsland May 3rd", with 9,720 lbs. milk at 3.84% in her first lactation and 10,540 lbs. milk at 3.98% in her second lactation. Hobsland Guide and Hobsland Victory are very closely related, and should make great sires for the Masterpiece heifers.

Another bull by "Netherton Viceroy" is "Holehouse Military Cross". This is an excellent yearling that is sure to be heard from at the fall shows. The dam of Viccroy has a record of 9,470 lbs. milk at 3.8% in 294 days. This young bull stood fifth at the Kilmarnock Bull Show in a class of eighty bulls.

"Holehouse Look Out" is also by "Netherton Viceroy". He is an extremely stylish individual and was a year old in March. His dam, "Holehouse Jean Again 3rd", gave 7,250 lbs. milk at 4.07% as a heifer.

"Barewheys The Goods", was sixth prize bull at the Kilmarnoch Show this Spring in the same class as "Holehouse Military Cross."

"Sandhill Rambler" by "Bargenoch What Care I" stood fourth at the Kilmarnock Show. He is a large, strong individual that would have stood higher in a Canadian ring. His dam's record as a two year old was 6,240 lbs. milk at 4.58%. The milk record of dam of sire was 10,530 lbs. at 3.98% in 280 days.

"Sandhill Optimist" by "Bargenoch What Care I" was bought at the Ayrshire Show. He stood third in the yearling class with fifty-five bulls entered. His dam's record was 7,500 lbs. milk at 3.85% in her first lactation. His dam of sire gave 10,530 lbs. milk at 3.89% in 280 days.

Another yearling by "Hobsland Scotland's Best" was bought at the Barr Sale; this "Hobsland Grand Parade". Milk record of dam was 8,560 lbs. milk at 3.75% in 46 weeks and 8,070 lbs. milk at 3.77% in 40 weeks, this was in the first and second lactations. Record of dam of sire was 11,250 lbs. milk at 3.97%.

"Thornhill Renewar" by "Netherhall Renown" was bought from A. Cunningham of Stewarton. He is out of "Netherhall Mildred" and his sire is from "Netherall Kate 25th", of the noted "Netherhall Kate" strain, she gave 10,920 lbs. milk at 4.03% in 46 weeks.

"Finlayston Eclipse", a March yearling, is by "Bargenoch Silver Knight". The milk record of his dam as a heifer was 7,650 lbs. milk at 4.03% as a heifer. The milk record of dam of sire was 10,200 lbs. milk at 4.20% in 41 weeks.

The heifers are a uniform lot and picked from some of the best herds in Scotland such as Hobsland, Auchenbay, Auchenbrain, Palmerston, Whitehall, Killoch, Holehouse Auchenleigh, Chapelhill, Moorefield and Catlins.

One of the choice ones of the lot is the young heifer, "Catlins Pansy 6th". She is by "Hobsland Victory", the new herd sire for BURNSIDE.

W. F. STEPHEN.

EXPERIMENTAL FARMS IMPORTATION

Mr. Robert Cunningham of the Central Experimental Farm at Ottawa, accompanied R. R. Ness to Scotland, and between them they selected a number of excellent individuals for the Ottawa herd. These arrived on the same boat and at present are in quarantine in St. John, N. B.

"Overton Lord Kyle" was bought at the Lenark Show and Sale to head the new herd. He is a yearling with great record backing, and an excellent individual from a conformation standpoint. His dam, "Overton Snowflake 2rd" gave 9,190 lbs. milk at 3.93% as a heifer and his dam of sire gave 10,-y50 lbs. milk at 3.56%.

In addition to this young bull he also secured some excellent Ayrshire matrons. From Hobsland came the grand young cow "Dunlop Betsy" and the yearling heifer, "Hobsland Betty 7th", who is a big strong heifer with great promise.

"Auchlochan Emerald" was purchased out of the renowned herd of Dr. Douglas, and she is by that great breeding bull "Golden Pippin", who is a son of the well known show cow "Auchenbrain Fanny 9th".

From A. Cunningham of Thornhill, Stewarton was purchased "Hardcroft Dewdrop 3rd", a grand young cow that should do well in the new herd.

It is worthy to note that Mr. Cunningham has built up a richly bred herd free from T. B. that are noted producers. As he will not keep any cow that will not give 10,000 lbs. milk in a lactation period.

From the Catlins herd came "Catlinns Barbara", a sister to the dam of "Hobsland Jean 5th" and "Hobsland Perfect Piece." This cow is of immense scale and capacity.

Mr. Ferguson of Auchinbay supplied a great three year old heifer, "Auchinbay Mina 5th," that has every indication of being a heavy producer. Her dam had a number of records averaging over 10,000 milk at over 4%.

Thomas Barber of Broomhill was also visited and a promising four year old cow "Broomhill Flo" was secured, and from James Howie was purchased a grand cow, (name not available at time of writing).

Perhaps the best cow of the lot is "Oldhall Maggie 9th", bought from Mr. Caldwell of Moorefield, and from John Caldwell of Coarsehill was secured a choice cow in "Culcaigrie Dot."

A useful dairy looking cow "Hareshaw Tibbie", was secured from the Hareshaw herd, and a yearling heifer "Grange Mary 5th" from John Slater of Grange Farm, Kirkcudbright, completes the list of Ayrshires for the farm.

In addition to the Ayrshires, Mr. Cunningham, who is also a sheep man worthy of note, secured a dozen choice Leicester shearling ewes to strengthen the already splendid flock kept at the Experimental Farm.

Mr. Cunningham had in his charge also a splendid young Yorkshire boar for Alex. Dynes of Ottawa. The sire, "Pelico", was the champion boar at the Highland in 1919, and his dam "Dalmenie Blossom" was champion at the Royal Show in England. His is considered to be the best boar that has ever left the other side.

W. F. STEPHEN.

WATER BOWLS

Editor "The Maritime Farmer",

The writer read with much interest a recent interesting and instructive article in your paper on watering cows.

There is no question but that the use of individual water bowls for cows is one of the greatest labor and time saving installations a dairyman can make. There is even a greater benefit from the use of individual water bowls than the labor saved. This is the extra profit made from cows by their being able to get the amount of water they need to produce their capacity of milk.

We thought that in this connection you would be interested in the following figures, which might make good reading for your many readers in backing up your arguments for the use of individual water bowls.

Sussex, as we all know, is the greatest milk producing section in the Maritime Provinces. In the last year, twenty-four of the leading dairymen around Sussex installed three hundred and nineteen water bowls. Mr. Robert Robinson of Millstream P. O., close to Sussex, told us recently that he considered that he got more value out of the water bowls he installed than any machinery or equipment he had ever bought on the farm.

Perhaps the most striking proof we have ever had of the benefit of water bowls came to us recently. Messrs. Snide Brothers, dairymen at Shubenacadie, N. S., ordered a complete water bowls installation costing them $205.00. Included in this order was a steel storage tank, which we were not ale to ship them for forty days after we had sent the water bowls, on account of not having the steel to make the tank. After they had installed the equipment, and had used it for a couple of months they asked us to pay them ($240.00), $6.00 a day for the forty days they were without use of the bowls. They have thirty cows and are able to prove to us that the water bowls increased their milk production to the extent of $6.00 a day.

We know that either of these men would be perfectly willing to have their statements printed if you care to use them in any of your arguments on water bowls.

St. John, N. B.,
Representing Beatty Bros.

AUCTION SALE OF FAT CATTLE AT THE EXPERIMENTAL STATION, CHARLOTTETOWN P. E. ISLAND

The auction sale of fat cattle at the Experimental Station was largely attended by the farmers in the neighborhood. There were not a very great many butchers present, and Mr. Brown, of York, was the only buyer outside of the city. The pen of dry cowss sold at an average price of $11.35 per hundred; the beef type of cows sold at an average price of $11.55 per hundred; the dairy type of steers sold at $12.52 per hundred, and the beef type of steers sold at $12.88 per hundred.

The feeding experiment conducted for 115 days from the first of December, was to determine whether it pays to fatten dry cows during the winter, or to sell them off in the autumn. The four pens mentioned above were fed the same quantity each of turnips, hay, oats, bran, cottonseed meal and oilcake and what screenings. Tee prices charged were just the actual cost of material as purchased. The total cost per pen for the 115 days was $162.27, or $40.57 to feed one animal for 115 days. The dry cows, which were just an ordinary lot of grades, sold at a loss of $6.67 per cow; the beef type of cows, which were Shorthorn grades, with one pure bred Shorthorn cow, sold at a loss of $4.34 per cow, while the dairy type of steers, fed in exactly the same way, gave a profit of $8.36 per steer, and the beef type of steers, which were grade Shorthorn cattle, gave an average profit of $14.84 per steer. While this experiment has not shown any very great profit on the whole, yet it contains a lot of very valuable information, which may be turned to profit by every farmer in the province.

The detailed figures in connection with this experiment are available for the press, and will appear in the annual report of the Experimental Station.

DO WE USE ENOUGH MILK?

It is a safe assertion that the achievements made in the science and practice of sanitary milk production during the last few years rank near the top of the list of those things which have contributed most to the well-being of the human race.

Of all the progress in dairy science two developments of the past few years stand out in bold relief. One of these, the discovery of the presence and function of vitamines in milk, has brought to light the fact that milk is as fundamental to the welfare of the young of the race as pure air and water.

There is no other single article of diet that will so quickly restore the healthy color and ruddy glow to the lips and cheeks, together with vigor and robustness, as this same fluid which the cow so generously supplies. How often when the family physician has been called in because the little one has become pale, languid, and weak, a tonic has been prescribed. But, at the same time, the doctor has recommended more fresh air and that milk should be substituted for the mixed diet. Immediately the signs of health and vigor have appeared, the result having, perhaps, come as much from the change of diet as to the prescription, if not more so.

The other development has been the increased production of sanitary milk, which has placed a pure and wholesome product in the hand of the masses at a reasonable cost.

Dr. McCollum, of the School of Hygiene, John Hopkins University, who has devoted his entire time for the past 13 years to the study of nutrition, has reached the conclusion that milk should be given particular prominence among foodstuffs, because of its unique value as a protective food. He says: "It has become evident that milk is the greatest factor of safety in our nutrition, and it is certain we could not have accomplished what we have had we dispensed with milk as food." With this opinion the leading experts on the subject of nutrition agree. According to the views of these men food must do more than satisfy the appetite and supply sufficient calories and protein to meet the bodily needs. It must maintain health by furnishing certain protective substances to the individual. These protective substances are lacking or are insufficient in most articles of food. They exist abundantly in only two common articles of diet, namely, in milk and in leafy vegetables, such as lettuce, spinach, cabbage, etc. These protective foods are essential not only for the maintenance of health, but also for satisfactory growth in the young. Leafy vegetables are not nearly as well adapted for protective foods for man as is milk, principally for the reason that they cannot be consumed in sufficient quantity.

Dr. McCollum also believes that the achievements of any race of people in science, art, and literature depends more on the milk consumption of that people than on any other factor. In other words he says that a nation that consumes milk liberally is bound to be a healthy, virile, and productive nation. "The Chinese, Japanese, and the peoples of the tropics generally have employed the leaves of plants as almost their sole protective food. They are characterized by small stature, relatively short span of life, high infant mortality, and by continued adherence to the employment of the simple mechanical intentions of their forefathers." It is said that the Japanese child, fed without cow's milk, requires two or three years longer than the Canadian to reach maturity, while the Japanese farmer of 60 corresponds in health and vigor to the Canadian of 80 years of age.

Milk is not only a substitute for meat, it is an improvement over meat. The free use of milk on the farm means reduced food bills, but more important than this, it means better health, greater capacity to work, and an increased joy in life. The farm housewife, at small expense, can use milk and cream freely in cooking, and insure a superior quality to the food on her table. Milk used in cooking gives full value in nourishing the family, and such use is a wise practice which should be extended rather than curtailed. In the majority of farm homes visited by the writer, milk does not apepar regularly on the table as a drink. A pitcher of milk freely passed around and a glass at every place is the best health insurance a farmer can have. Whole milk is best, but skimmilk is excellent. We all know how well pigs and chickens thrive on milk—even skim milk. It is certain that milk is as beneficial for man as for farm animals. Let us use more of it, especially on the farm, where it is produced relatively cheap.

FINANCIAL MEN WAKENING UP

A timely message of advice to Canadian financial men has recently been sounded by F. H. Sissons, vice-president of the Guaranty Trust Company, New York, who in the course of an address the other day said:—

"The farmers demand more control in the financial field. The farmers' problems have become more complex. The cost of agricultural production has risen immensely, in line with the increased prices of farm products.

"The Farmers' Government has secured office largely because the farmers desired two things: the elimination of the middleman and a larger amount of credit. I think fundamentally that is sound. The middleman takes too much from the farmers' revenue, and the farmer has not had adequate credit for the work he must carry on. So, if the farmers are to be supported in that contention, it is the part of the financial leaders, not only of the United States, but of Canada, to devise ways and means by which credit can be extended on a sound basis to aid in developing this great mine of gold which lies in our fallow and unfallow fields in both countries."

It has taken the bankers a long time to swing into line. Now they have got to do it, otherwise with the farmers getting in control legislation will be enacted to compel them to grant liberal credits.

FATAL CARELESSNESS

A striking demonstration of the extent to which carelessness and foolhardiness are responsible for fatal accidents is given in figures on grade crossing accidents in the United States during 1919 by Mr. R. L. Clancy, safety expert of the Southern Pacific Railway. At these crossings 531 automobiles were damaged or destroyed, 46 people killed and 173 injured. Of these 531 cars, 73 stalled on the crossings and were struck by trains, 263 attempted to cross almost immediately in front of approaching trains, 173 ran into trains, 9 skidded into trains in effort to avoid collision after going too close, 31 ran into lowered crossing gates, 5 ran into flagmen stationed to keep back traffic, and 14 were due to miscellaneous causes. By far the greater number of these 531 accidents, it is evident, could have been avoided by reasonable caution. Mr. Clancy has pointed out that although a passenger train approaching a crossing at full speed may be a quarter of a mile away when a motor car arrives at the spot, it will be roaring over the crossing 18 seconds later. That brief space is not sufficient to permit the motor car to cross in full assuranec of safety and it would cause the motorist no delay to wait it out.

The several branches and divisions of the federal Department of Agriculture are each putting forth every effort to advance the interests of the farming industry. Dairying is gaining new strength. Live stock and field crops are continuing their progress and the poultry industry is taking a leading place in Canadian agriculture. The Report of the Minister of Agriculture for the Dominion of Canada for the year ending March 31, 1919, obtainable from The Publications Branch, Department of Agriculture, Ottawa, sets forth the activities of the Department for the fiscal year 1918-19. It shows what has been accomplished in the various branches and indicates the progress of agriculture in general. Among other interesting facts it states that Canada in 1918 produced about one hundred tons of field root and vegetable seeds. This phase of the industry is a new one, but its possibilities are almost unlimited.

The whole problem of gettnig more money or, more correctly speaking, of realizing a greater profit for the market egg may be boiled down to three definite propositions: First, the poultryman must take cognizance of the new order of things and keep abreast of the times by putting all his operations on an efficient basis; second, he must recognize the demand of the market for quality and maintain his product at a high standard of excellence; third, he must study the marketing problem in all its ramifications in order to dispose of his products to the best advantage.

Any big "chuck holes" in the road in front of your farm? You may not get paid in dollars and cents to fill these in, but you will feel a lot better by doing so and it makes your farm look all the better. Where the farmers all take an interest in the roads bordering their farms, they are willing to fill up the holes in the roads without waiting for pay.

Notes on Fertilizers and Their Use

By Dr. Frank T. Shutt, Dominion Chemist

It is with regret that I find myself unable to be present at this meeting. It would have afforded me much pleasure to take part in your discussions and to renew old friendships among the farmers and dairymen of New Brunswick.

In this short paper on Fertilizers and their use it will of course be quite impossible to even touch upon every phase of this important subject. My purposes, therefore, will simply be to briefly emphasize certain features and considerations in connection with the practice of fertilizing that may be of more or less interest under present day conditions and which may serve as points for your discussion.

First, I should like to say that our correspondence with farmers during the past winter points to a largely increased use of fertilizers, especially in the Maritime Provinces, this season. This, while in part may be the result of the wider disemination of reliable information regarding the nature of fertilizers and the profit that may be obtained by their rational use, is no doubt lagely due to the higher prices nowadays received for farm produce, and more particularly for those crops for which fertilizers are specially used. It is quite true that in common with everything else the prices of fertilizers are higher than ever before, due largely to labor troubles, higher wages and increased freight rates. This may deter some from purchasing fertilizers, but I wish to point out in this connection that the increase in value of farm produce —and especially of potatoes, the crop more than any other for which fertilizers are employed in the Maritime Provinces—is proportionately greater than the advance in the cost of fertilizers. There is, therefore, no economy in refraining this season from purchasing and using fertilizers.

There are two points in this connection which I wish to emphasize. The first is the early ordering of supplies. This is the more important owing to the difficulties and delays nowadays of transportation, more particularly as the season adavnces. The farmer should calculate his requirements in December and after obtaining quotations from various fertilizer firms—a matter too frequently entirely neglected—and studying the guranteed analyses of the various brands offered—if a ready mixed fertilizer is determined on—the order should be placed. Properly stored there is no appreciable deterioration between midwinter and the time of application if the mixed goods have been well made. Of course with regard to fertilizer constituents—nitrate of soda, sulphate of ammonia, superphosphate, basic slag, muriate and sulphate of potash, there is no loss, change or deterioration if kept in a dry place. Having the goods on hand at the opening of the season may mean an appreciable increase in yield through being able to go ahead with the work as soon as the soil is in a favorable condition for working.

And the second point is that we ought to do more co-operative buying. There are two savings to be effected thereby, the first in the reduced prices of the goods if ordered in car load lots and the second in freight charges. Of course some farmers are so located that co-operative purchasing is out of the question, but wherever possible it should be practised. I commend these suggestions for your consideration.

You will naturally expect me to say something as to the form in which you should buy your fertilizers—the fertilizer materials (or constituents) or the ready-mixed goods. I favor the former, for several reason but I recognize also that there are tmes and occasions when to purchase the latter is the mor convenient.

In buyng nitrate of soda, sulphate of ammonia, muriate and sulphate of potash in original bags we may be quite sure of the quality. These goods may be considered as "standard" and as always containing, within small limits, certain well known percentages of plant food. Every user of fertilizer should familiarize himself with the percentages of nitrogen or potash, as the case may be, which these materials contain. There are other fertilizer materials that need more careful scrutinizing as to composition — super-phosphate (acid phosphate), tankage, dried blood, fish-meal, bonemeal; the guarantee as to plant food of those should be obtained.

Among the adavntages in purchasing the fertilizer materials rather than the ready mixed goods are (1) the oportunity of a more intelligent sfudy of soil deficiencies and crop requirements—and consequently the possibility of a more effective and economic conduct of our work in increasing crop yields and (2) the saving in cost per unit of plant food to be effected. The fertilizer manufacturer must charge for grinding, mixing, bagging, sales commissions, advertising, etc., in addition to overhead expenses and profit. This charge—amounting presumably to 25 per cent. to 40 per cent. on the original cost of the material (in addition to freight charges on "filler" if such be used) may be in a large degree saved if the farmer is prpared to do a little calculating and expend some work and time on weighing, pounding or crushing and mixing. The implements for this work are not necessarily expensive and the work itself does not entail any special skill or experience. It is claimed by some that home-made mixtures are no so intimately mixed nor so finely ground—and consequently not capable of as uniform distribution on the land—as the ready-mixed fertilizers. This is no doubt sometimes true, but the remedy is in the farmer's hands—he must put more thoroughness in to his work.

If, however, it is decided to purchase a ready mixed fertilizer, I believe, the farmer may depend on the guarantee issued by the manuafcturer —if he buys from well-known firms. The official control under the Fertilizer Act has shown an honest endeavor on the part of by far the larger number of Canadian fertilizer firms to live up to and to deliver goods as specified. It is satisfactory to know this. There are, however, one or two products on the fertilized market that are not quite honestly advertised. The point is demand the guarantee and scurtinize it carefully. Buy only on percentages of nitrogen, phosphoric acid and potash and their availability and disregard all other claims —as for instance the benefit to be derived from the presence of ground limestone, which in the mixed goods is charged for at exorbitant prices. Buy your ground limestone separately and then you will know what you are paying for it.

Further, in this connection, don't purchase any fertilizer simply on the ground that it is cheap. There are low grade and high grade fertilizers on the market. Both may be honest goods but the high grade, as containing the larger percentages of plant food, will be the more economical to buy—for the freight rate on both classes wil lbe the same. This past year there has been a marked improvement on th part of many fertilizer manufacturers to advocate and put out only what might be termed high grade brands—brands containing not less than 14 per cent. of plant food constituents as with formulae 3:9:2. 4:8:4, etc. Ths is an excellent move. It will reduce, simply on the ground of freight charges, the price per unit of plant food in the goods. My advice in this matter is, other things being equal, buy brands showing high percentages; they ought to be cheaper, considering their quality.

With these several considerations we must pass on to speak briefly and specifically of certain fertilizer materials and their use.

Nitrogen

Nitrate of soda (15-16 per cent. nitrogen) continues to hold the premier place among fertilizer sources of available nitrogen. Its nitrogen is immediately and directly, i. e., without any conversion, available to the growing crop; hence its special value in the early and cold weeks of the season before nitrification starts. From the extreme solubility of this compound and the fact that on light soils especially, it is liable to get quickly leached to the subsoil by heavy rains, it is not economical that any single application should exceed 100 pounds per acre. For many crops and especially for hay and pasture lands, the best results are obtained by two or more top dressings of say 50 to 75 pounds each at intervals—say of 18 days to 3 weeks—during the earlier weeks of growth.

Sulphate of ammonia (20 per cent. nitrogen), though equally soluble with nitrate of soda, is slower in its action, since its nitrogen must first undergo nitrification before it is usable by crops. It is well adapted for use in moise climates and on soils well provided with lime. Its exclusive and continued use tends to render a soil distinctl yacid, due to loss through leaching of the soils carbonate of lime.

Our experiments in Eastern Canada have shown that for the potato crop at least, a mixture of nitrate of soda and sulphate of ammonia may prove superior to either of these materials alone. The results at several of the branch Farms indicate that the initial application of 75 pounds nitrate of soda and 75 pounds sulphate of ammonia per acre, marks the approximate dressing that can be given with profit, provided the land is in fair condition, as for instance one prepared by ploughing under a good clover sod which has been lightly dressed with manure.

Of organic forms of nitrogen—organic ammonia they are called by the fertilizer trade—there are many and they differ vastly not only in nitrogen content but in the availability of their nitrogen. If purchased, it is necessary not only to scrutinize their nitrogen content but also to study their nature and source. Dried blood ranks first among these in availability; fish meal and tankage—of which there are many grades—supply in less readily available forms and are therefore more suitble for crops with a long season of growth. They generally furnish a fair proportion of the nitrogen in mixed goods. There are other abattoir by-products, such as horn and hoof meal, wool and hair waste, in which the nitrogen is so slowly available that it is doubtful if they can be profitably employed.

Phosphoric Acid

Superphosphate or acid phoosphate is, by reason of the ready availability of its phosphoric acid, the most widely used of phosphoric fertilizers. It is usually sold in two grades, containing, respectively, 14 and 16 per cent. available phosphoric acid, but it is necessary to scrutinize the guarantee. The application is in the neighborhood of 300 pounds per acre. It is suitable for a large variety of soils and crops and its maximum (but not its entire) beneficial influence is obtained the season of application.

Bone meal contains from 20 to 25 per cent. of phosphoric acid and 2 to 4 per cent. of nitrogen. Here again the purchase should be made on guaranteed analysis only. The phosphoric acid in bone meal is not immediatly available, but is gradually liberated throughout the season. It is more particularly adapated to warm, moist, rathrer light loams. It is generally considered a "lasting" manure and is useful for the permanent improvement of the soil. Undoubtedly its beneficial influence is in part due to its nitrogen, which is gradually nitrified as the season advances.

Basic slag is an alkaline phosphatic fertilizer and therefore specially valuable for sour soils and soils deficient in lime; it is also a desirable form for heavy clay loams and soils rich in vegetable matter as mucks. Its phosphoric acid is not soluble in water but is nevertheless present in forms that are more or less readily set free in the soil—hence may be considered as available. There are many grades on the market and slag should always be purchsed on its phosphoric acid content and its degree of fineness—the latter an important matter as affecting the availability of its phosphoric acid. From 75 to 85 per cent. of the slag should pass through a sieve having 100 wires to the linear inch. With this degree of fineness, the price should be commensurate with its phosphoric acid content. There seems good reason to disregard the Wagner standard of availability, viz., solubility in 2 per cent. citric acid; many experiments in England and Scotland in recent years have conclusively shown that the availability of the phosphoric of slags is not measured by ts solubility in this solution.

As our experimental data accumulates we shall be more and more impressed with the value of basic slag. Results point to it being found an effective and profitable phosphatis fertilizer in many parts of the Dominion, especially for soils defiicent in available lime (of which we have large areas) and for heavy clay loams. It is worthy of trial as a top dressing (500 pounds per acre) on pastures, since it will encourage the growth of clover and the finer grasses, thus increasing the nutritive value of the herbage. It should also be useful for many crops with a long season of growth—turnips, mangels, corn, etc. and for orchard work. In a sense it is a slow-acting fertilizer, hut is is a durable one. Its full return will not be obtained the season of applcation, but its effect will be marked, as a rule, throughout the rotation.

Potash

We have now reached a difficult matter; one in which under present day conditions it is almost impossible to give definite advice. In pre-war days we obtained our entire supply of potash salts from the Strassfurt mines in Germany. As you all very well know, this source of supply being cut off by the war, potash in fertilizers has been practically unprocurable for the past five years, or if obtainable it has been at such prices as to make its use in agriculture almost prohibitive. Unfortunately, notwithstanding the war is over, the situation is but little changed. There is very little, if any, German potash on the Canadian market today. We may confidently expect for next year a supply from the mines in Alsace—again French territory—but it is doubtful if any quantity reaches our shores in time for this season's application. There is a great shortage in the stores of potash in Europe, and this must largely be met before there will be heavy exports.

HORTICULTURE.

APPLE SPRAYING IN NEW BRUNSWICK

by G. E. Sanders

Mr. President and Gentlemen:—

I presume that each and everyone of you are open to congratulations as a result of your phenomenal results of last year. You were able to demonstrate last year (1) the value of the McIntosh and Snow as you grow them in New Brunswick, and (2) the value of spraying. Your McIntosh apples are taking the place of the product of the Snow or Famuse orchards, which were killed out in some districts by the sevtre winter of 1917-18, and there seems little doubt but that you will continue to get large returns from the splendid asset which your McIntosh orchards have proved to be. I am not going to advise you to plant or not to plant more McIntosh, as it is not my business to do so. Such advice should come from your provincial officer, but I am here to tell you that it is worth while taking care of the McIntosh trees that you now have, particularly as regards their spraying, for it is evident that the next few years will see a great shortage and consequent high price for this most delicious fruit. The McIntosh is one of the most susceptible apples to scab, and on account of the gerat demand for high grade McIntosh fruit, the returns for money expended in spraying this tree are much higher than the returns from spraying most other varieties, although we all realize that we cannot afford to neglect spraying any variety.

Returns From Spraying

Growers get two separate and distinct classes of returns from spraying. The first and most noticeable is the improvement in quality, or the prevention of diseases, and insect injuries and the growing of clean high grade fruit. The second and least apparent benefit which results in infinitely larger returns than the first is the increase in quantity of fruit produced. This second class of returns is usually much greater the year following the application of spray than it is the year that the spray is applied.

Improvement in Quality

Two years ago we carried on an experiment in Mr. S. B. Hatheway's orchard on McIntosh, and from one spray before the blossoms, and two after we were able to get McIntosh that were 91 per cent free from apple scab, while where we did not spray they ran only 6 per cent. free from scab. Last year we carried on another experiment in Mr. A. G. Dunphy's orchard, and we were able to get from four sprayings, McIntosh 76 percent free from scab, while among the unsprayed McIntosh we were unable to find a single clean apple.

One of the finest demonstrations of thorough spraying in New Brunswick this year was on the Springhill Orchards, which is managed by Mr. Hatheway. Mr. Hatheway sprayed on May 28th with 3-10-40 Bordeaux, and one pound of arsenate of lime to 40 gallons. One June 23rd he sprayed with soluble sulphur 1 pound, arsenate of lime ½ pound, hydrated lime 5 pounds, water 40 gallons. On July 9th he sprayed with 3-10-40 Bordeaux, and one pound arsenate of lime to 40 gallons water.

The returns from 367 barrels of all varieties and grades totaled $1854.17 or an average price of $5.05 per barrel. One particular lot of 104 barrels of all grades, mostly of the McIntosh variety, sold for $815.00 in the open market in Montreal. The average net price f. o. b. Fredericton was $6.36 per barrel. I do not think that I need say more in emphasizing the value of thorough spraying in your New Brunswick orchards.

What to Spray with in New Brunswick

There seems but little doubt in view of the results of the past three years, as compared with those of previous years when you were using lime sulphur that where possible it is best to use 3-10-40 Bordeaux. That is, Bordeaux of that formula should be used for all excepting the calyx application. In most seasons it is probable that two applications of Bordeaux before the blossoms will give better results than one. One pound of arsenate of lime to 40 gallons is the proper quantity to use in Bordeaux.

For the calyx spray use almost anything excepting Bordeaux, as Borlime ¾ pound, hydrated lime, 5 pou deaux russets at this period. Any of the following may be used:—

1. Dry lime sulphur 4 pounrs, arsenate of lime ¾ pound, hydrated lime 5 pounds, to 40 gallons water.
2. 3 pounds dry lead arsenate to 40 gallons of water, adding two pounds of hydrated lime.
3. 1 pound of soluble sulphur, ½ pound of arsenate of lime, 5 pounds of hydrated lime to 40 gallons water.

Whichever of the above three are most convenient to you may be used for the calyx application.

For the application two weeks after the blossoms 3-10-40 Bordeaux and one pound of arsenate of lime to 40 gallons of water should be used.

How to Mix Bordeaux

For these growers who have poor sprayers the finely crystalized copper sulphate, that Mr. Turney has on hand, will prove a decided time saver. You can weigh out the right quantity of copper sulphate and put it into your strainer before filling or if your pump is equipped with a paddle agitator you can dump it directly into the tank and then run the agitator while filling the tank. When the tank is two thirds full dump in three times as much hydrated lime as you used of bluestone and stir rapidly so as to mix the lime thoroughly through the solution before it dissolves. This will give you the same effect as pouring dilute solutions together. Last of all add your poison. It is best to use arsenate of lime for Bordeaux for the apple, as it is the cheapest of safe poisons for the purpose, and is a most satisfactory killed in Bordeaux.

The most essential point in making Bordeaux for the apple is never to use less than three parts of lime to one of copper sulphate.

STRAWBERRY PLANTS

Senator Dunlap, Brandywine, Sample, Dickie, and other standard varieties for sale at reasonable prices. Send for price list.

JOHN N. CHUTE,
BERWICK, N. S.

Fruit Packages

We Manufacture Strawberry Boxes and Crates for same, 6 qt. Baskets, Apple Boxes, Box Shooks, Apple Graders, Wheelbarrows. Now is the time to lay in a supply of Fruit Packages for the coming season. We have a good stock on hand, order early and ensure prompt shipment. Price on application to

Hantsport Fruit Basket Co,. Ltd.

HANTSPORT, N. S.

A Sprayer of Many Uses

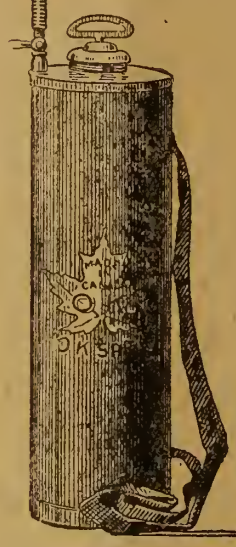
A sure-death gun for bugs and vermin, O-K-Spra may also be used to wash your motor car or to apply cold water paints and whitewash to barns and henhouses.

O-K-SPRA

will rid buildings and animals of vermin. It will apply cow wash in fly time, remove old wall paper or wash windows. It has been used as a fire extinguisher. Everything a good sprayer should be.

The O-K Canadian Two-Row Sprayer

is a wheelbarrow type of sprayer that serves small acreages with big results. It is sturdily built, easy to operate.



We have recently bought the manufacturing rights of the Aylmer Barrel Sprayer which, added to our line, makes it more complete to choose from. If interested write for more particulars.

Valuable spraying calendar suitable for Canadian conditions supplied with each sprayer. Write for literature.

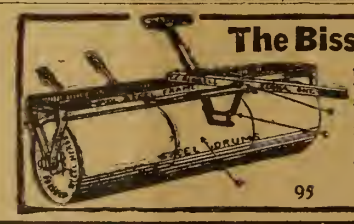
The Apple Maggot

Many of these present know the apple maggot or railroad worm, which damages fall apples to such an extent all through New Brunswick. The adult of the apple maggot is a small fly which emerges from the earth in July and deposits its eggs under the skin of the apple. The young larvae emerging from the eggs tunnel all through the flesh of the fruit reducing it to a pulp. Apples infested with maggots are as you know unfit for human food. When the apples drop to the ground the maggots leave, and enter the soil there to change to puparia. About two thirds of these will emerge as adult flies the following July, and about one third will not emerge until one year from the following July. In order, therefore, to clean up an orchard one should spray for two consecutive years.

This year we carried on a demonstration in apple maggot control in Mr. Isaac Stephenson's orchard. The following article on the results was written by Mr. P. C. Gilliatt, who had charge of the experiment. The method followed is that outlined by Prof. W. H. Brittain, of Truro, N. S.

APPLE MAGGOT CONTROL IN NEW BRUNSWICK, 1919

This demonstration took place in the orchard of W. I. Stephenson, Maugerville, N. B., where apple maggot had been a pest to the extent of practically ruining the crop for sev-



The Bissell Steel Roller has a rigid steel frame —no wood whatever. Large roller bearings and strong 2" axles insure durability and great strength. The Bissell is a 3-drum Roller of good weight, built to stand hard usage and give great service. Write Dept. M for free catalogue.

GROW STRAWBERRIES

We WANT your order for STRAWBERRY PLANTS this coming season. Of course you are planting a larger acreage than usual,—everybody's doing it, for strawberry growing at the prices now days is a sure fire money maker. The Canning factories are anxious to buy all the berries they can secure, so we now have no fear of over production. Get our plants and be sure of big crops. Senator Dunlap, Warfield, Beder Wood and Dr. Burrell, six dollars a thousand. Sample, Glen Mary, Premier and Bubach seven dollars a thousand. We allow one dollar a thousand discount from these prices on all orders of four thousand or over of one variety. Send for Catalogue. It's Free.

CYRUS & MANNING ELLS, Port Williams, N. S.

eral years previous. The orchard consisted of mixed varieties, in sod, rather scattered, but in a thrifty condition. Two applications of arsenate of lead were applied, first application July 12th, ten pounds of arsenate of lead (paste) to one hundred gallons of water. Second application July 24th, using 4 pounds of dry arsenate of lead to one hundred gallons of water. (Ten pounds of paste are equal to five pounds of dry lead arsenate in killing value). Wire cages had been set over a quantity of badly infested apples the previous fall so as to catch the maggot flies if possible, and then apply the first spray as soon as the first fly emerged in the cage, but for some unknown reason at no time during the season could a single fly be found in the cages.

On account of the orchard being eighteen miles distant from Fredericton it could not be watched as closely as it should have been, but no flies could be found in the orchard when the first spray was applied on July 12th. From this date until the second application the rains were frequent and considerable washing off of the poison was the result. On July 24th quite a number of flies could be found on the trees as well as a few punctures on the Crimson Beauties, the second spray was at once applied. The height of the emergence was evidently around this date, for a visit was made every week after this second spray during the emerging period, and there was only noticed a stray fly on one or two occasions. It is absolutely necessary for success to spray all trees in the orchard whether bearing or not, for though the fly feed chiefly on the surface of the apple, it also feeds to a certain extent upon a waxey material on the leaves, in which case it could after feeding, fly over and do some puncturing of apples on bearing trees. It is also necessary to spray from all sides of the trees, and not from one side only.

The following results were obtained in this orchard:—

Variety	Apples with one Punct.	Apples with more than one Punct.	Total Apples Counted	More than 1 Punct. %	More than 1 Punct. %	Total Punctured %
Crimson Beauty	195	56	4320	4.5	1.3	5.8
Duchess	28	42	2800	1.0	1.5	2.5
Dudley	109	32	3210	3.4	1.0	4.4

In an orchard belonging to Mr. Denning two rods distant, which received no spray, it was impossible to find an apple not punctured, most of them so badly that it was difficult to make correct counts. The following are from counts taken:—

Variety	Apples with one Punct.	Apples with more than one Punct.	Total Apples Counted	More than 1 Punct. %	More than 1 Punct. %	Total Punctured %
Duchess	0	890	890	0	100	100
Irish Peach.....	0	540	540	0	100	100
Gideon	0	950	950	0	100	100
Alexander	0	1100	1100	0	100	100
Red Astrachan..:	0	420	420	0	100	100

Comparing the crop in Mr. Stephenson's orchard for the past three years.
1917, total crop 120 barrels, 90% affected with apple maggot.
1918, total crop 130 barrels, 80% affected with apple maggot.
1919, total crop 600 barrels, 2% affected with apple maggot.

The varieties that were attacked in 1917 and 1918 were 100% affected, totally unmarketable being only fit for feeding, the small percentage of sound apples being due to a few varieties that were more or less immune from the attack of the apple fly. Some of these varieties were Gane, Ben Davis, and Salome. For the past few years the money returns from this orchard have been practically nil, whereas this season he took the top prices on both the St. John and Montreal markets with his Crimson Beauty. With his other fall varieties he did almost as well. The splendid results of this work and its great practical value is seen in comparing the crops and other values for the past three years in Mr. Stephenson's orchard. Taking into consideration the overhead and standing charges and expenses Mr. Stephenson's orchard gave practically no returns in 1917 and 1918, whereas this year the crop sold for about $1800.00 and might have been sold to still greater advantage.

Green Apple Bug

A few years ago we were surprised to find an infestation of Green Apple Bug here in New Brunswick. This insect was first discovered in Nova Scotia a few years ago by Prof. Brittain and to-day it is one of our important pests there.

The Green Apple Bug lives over winter as an egg in the twigs of the apple, and emerges in the spring to feed by sucking at the opening buds, flowers, and twigs. Most of the attacked apples drop, but some remain on the trees as gnarled and twisted culls. The result of the work of the Green Apple Bug closely resembles that of the Curculio.

Being a sucking insect it has to be controlled by contact sprays. Last year we followed the formulas and periods laid down by Prof. Brittain in the orchard of Mr. A. G. Dunphy of Douglas and secured excellent results.

The following summary of our spraying programme and the results from it was drawn up by Mr. G. P. Walker, who had charge of the experiment:—

(Continued on page 556)

STOP THIS WASTE!

Grow better fruit and vegetables

Spramotor

It isn't a SPRAMOTOR unless we made it

Kills Rot and Scab
Kills Blight and Pests
Kills Bugs and Worms
Kills Weeds

THIS All-Canadian spraying machine has been on the market over 25 years, and proven best for Canadian use. In that time it has repeatedly met the world's best in competition and captured over 100 Gold Medals and First Awards, including the coveted Canadian Government spraying contest award.

A Spramotor will double and treble your yield of apples, pears, peaches, grapes, plums, etc., and get you better fruit. It will do the same with potatoes and row crops, kill mustard in the growing grain, spray paint, whitewash and disinfectant on barns, stables, pens, etc., six times as quick as by hand. All styles and sizes, $7. to $400.

FREE! Crop Disease Booklet containing Government Reports and information. Write for your copy to-day.

5. SPRAMOTOR CO., 23 KING STREET, LONDON, CANADA.

BRUCE'S

Famous Root Seeds

Bruce's Giant Feeding Beet. In two colors, White and Rose, a cross between Sugar Beet and Mangel, splendid croppers and unequalled for feeding, easily harvested, and keep well. ¼ lb. 25c, ½ lb. 40c, 1 lb. 75c, 5 lbs. $3.50, postpaid.

Bruce's Mammoth White Carrot. Half Long Variety, heavy cropper, splendid quality, easily harvested, grand keeper. ¼ lb. 35c, ½ lb. 60c, 1lb. $1.00, postpaid.

Bruce's Giant Yellow Mangel. An intermediate variety, heavy cropper, good keeper, of splendid feeding quality and easily harvested. ¼ lb. 25c, ½ lb. 40c, 1 lb. 75c, 5 lbs. $3.50 postpaid. Also Yellow Leviathan, Giant Yellow Globe, Golden Tankard and Mammoth Long Red Mangels at same price.

Bruce's New Century Swede Turnip. A grand purple top variety, splendid for the table and also for feeding cattle, a grand keeper and shipper. ¼ lb. 35c, ½ lb. 60c, 1 lb. $1.10, 5 lbs. $5.25, postpaid.

Also Bruce's Selected, Bruce's Giant King, Hall's Westbury, Elephant, Magnum Bonum, Kangaroo and Hartley's Swedes at ¼ lb. 35c, ½ lb. 60c, 1 lb. $1.10, 5 lbs. $5.25, postpaid.

Also Aberdeen's, White Globe and Greystone Turnip, at ¼ lb. 30c, ½ lb. 55c, 1 lb. $1.00, and 5 lbs. $4.75, postpaid.

It's a Fact-You Know
Every Farm Needs Fertilizers

Try as you will, you cannot get bumper crops from your soil if you don't fertilize it. There is no mystery about this. It simply means that, as soil gets worn out, Fertilizers must replace the elements that have been used up.

"Best-by-Test" FERTILIZERS

Best-by-Test Fertilizers have full analysis strength—guaranteed. Write us for particulars and we will advise the kind of Fertilizer to order. We are exclusive Fertilizer experts and can supply all and every chemical required. Farmers can club together and buy in carload lots. Prices on application.

Write for interesting book on Fertilizers—FREE.

DAIRYING.

PURE BRED VERSUS GRADE DAIRY CATTLE

(Experimental Farms Note)

The old question "would you advise me to start into the pure bred dairy cattle business", is being asked as frequently these times as ever before, and is receiving just as many negative replies as formerly. There are so many factors which enter into the problem that one has to study the question from every angle. Good pure bred cattle of either sex are selling for such good prices now that men who have proven themselves successful with grade stock, cannot afford to continue without pure breds. We all know of certain grade herds making more money for the owners than some pure bred herds in the same locality, but every community has examples of men in the pure bred business who never should have invested money in live stock.

The most economical and the most satisfactory way for the average farmer to start into pure-breds is to purchase good females to start with. Care should be taken to see that they are good. They should be healthy, of the proper type, and either proven producers or with proven ancestors. It is better to have only one good cow than several medium quality animals. A comparatively small outlay is necessary when starting in this manner.

It is remarkable how quickly a herd can be built up from a few foundation cows. The dairy herd on the Agassiz Experimental Farm was started by the purchase in December, 1911, of twenty-eight grade cows and the following year three pure bred cows. Then in the fall of 1915 two pure bred heifer calves and the next year a pair of two year old heifers also pure bred were purchased. Today there are forty-two pure bred females in the herd including the above and their descendents. As the pure bred herd increased in size, we have gradually decreased the number of grades, until at present, only twenty-one are on hand.

A yearly comparison has been made during the last three years, of the five most profitable pure bred cows and the five most profitable grade cows. In each instance the pure breds have been the more successful from a commercial standpoint. On the average, the pure breds produced 4.476 pounds more milk and 153 pounds more fat per cow per annum, and yielded an average profit over feed cost of $27.64 more per cow than the grades.

After a pure bred herd reaches a suitable size, the most money is made by selling the surplus stock for breeding purposes. The Holstein bull, Inka Sylvia Beets Posch, 5563, was used as senior sire in the Agassiz herd from December 1916 to July 1918. From his service during that period fifteen grade and twelve pure bred females were raised and are in the herd at the present time. Putting the very topmost value on the fifteen grade heifers they are worth $1875.00, while the dozen pure bred heifers are worth just about twice that amount, yet they cost no more to raise than the grades. The pure bred male calves born in the herd during the same period were sold for $100.00 each and up, while the grade bulls were sold for veal.

Not only is it more profitable to produce pure bred cattle than grades, under suitable conditions, but the pleasure and interest are much greater.—W. H. Hicks, Superintendent, Experimental Farm, Agassiz, B. C.

THE INFLUENCE OF AYRSHIRE SIRES

I have become reminiscent this morning and my mind carries me back to my boyhood days, and I recall the class of dairy cows in my home communty, some were solid red, some red ,with white bellies and faces some brindle. The latter had upturned horns, but the majority had inturned or crumpled horns. The cow that gave a three-quarter pail of milk in flush was considered a wonderful cow and would be worth at least $30. Suffice it to say the best of them would not give 4,000 lbs. of milk in a season. Their weight would range from 800 to 1,000 lbs.

Fifteen years later I reall a different class of cows, at least 1,000 lbs. heavier in weight, stronger, more vigorous, with upturned horns, red and white in color, and with a larger milk capacity.

Thirty years later.—The old style cow has almost disappeared. She has been supplemented by a strong, vigorous cow of fine type, white and red in color with upturned spreading horns, deep body with well sprung ribs, shapely udders and good teats,—a contrast from the shapeless udders and immense tapering teats of the old stock. The weight had increased by 200 to 300 lbs. and the average milk production from 2,000 to 3,000 lbs. per season. What made this change? The universal use of Ayrshire bulls.

The first Ayrshire bull to be brought into the communty was "Sir William," bought at 2 weeks old by my late father for $30.00. This was in 1868. What ridicule he had to endure. Prejudice had to be broken down. It was the bane of progress then, and unfortunately, it is still a hindrance to present day progress. With Scotch determination my father outlined it and ere long saw the fruits of his efforts in improved dairy cows in the community, as this bull was widely used, as well as his progeny.

A few years later Mr. James McFarlane brought in "Sir Philip," another Ayrshire bull of wonderful strenfith and prepotency. This bull mated to the progeny of "Sir William" brought wonderful results in cows of strong Ayrshire type, character and increased production.

The community was studded with cheeseries,—one at almost every cross roads—and from the milk of these Ayrshire cows a pound of cheese could be made from less than a 10 lb. milk average for the season. About this time I was census enumerator in the community and particularly noted the production of many of these high grade Ayrshire herds, which ranged from 6,500 to 8,000 lbs. of milk per cow for the season,—a good aevrage for those days when summer dairying only was carried on.

I have heard many favorable comments on the class of dairy cattle in this particular community. Frequently I have heard men say, "I never saw such fine dairy cows as you have here." All because Ayrshire bulls were universally used. Their fame as herd builders spread to other communities and the whole district became noted for its high class Ayrshire grades. So noted did t become that men came from far and near for cows for foundation stock. A few years ago a dairy firm in the United States, that supplied certified milk for New York City, came over and took away 220 head, ten car loads, all tuberculin tested and came back six months later for 50 head more. Sufficie it to say this firm has been coming back every years since for new blood. Ayrshire bulls built up the dairy interests of this particular community as nothing else has ever done and will build up the dairy herds of any community, if given an opportunity. The use of Ayrshire bulls on our grade herds always lead upwards and to prosperity.

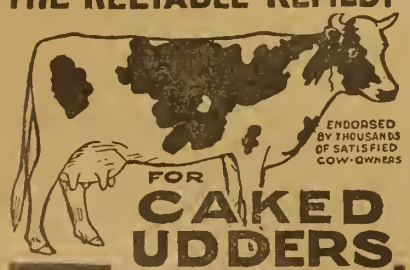
HOW TO RAISE THE HAND-FED CALF

The growth of the calf during the first year of its life depends much upon the start it gets the first month. It seems to be a common belief among dairymen, and cattle breeders in particular, that if a calf is neglected during the first few weeks of its life no amuont of feed and care can make up for that setback. Therefore it is important to take good care of the young calf, and do not allow it to suffer in any way. The calf should be removed from its dam when two or three days old and taught to drink. Some successful dairymen recommend taking the calf away from its dam as soon as born, but it is no difficult matter to teach a calf to drink when only a few days old, and the calf seems to do better if allowed to nurse for a few times. It is also noticeable that the cow's udder is helped by allowing the calf to nurse if it is not too rough.

The calf should have warm whole milk for ten days to two weeks, then skim milk may be gradually substituted till at three weeks of age the calf is receiving no whole milk whatever. It is necessary to supply some substitute for the fat of the whole milk, and this may be done in several ways. Howeverfi flaxseed jelly is about the best, and it is not difficult t oobtain. This is made by simmering a lb. of ground flaxseed in three quarts of water till a thick jelly is formed. This jelly should be added in small quantities at first and slowly increased till, at three months of age, a cupful is being fed twice daily.

As the calf gets over three weeks old it will start to nibble at a little hay, and this should always be kept within reach of them at all times. At about the same time it will commence to eat a ltitle grain, and for this purpose there is nothing better than equal parts of bran and oats (whole oats preferred) fed in addition to flaxseed jelly and skim milk. In feeding calves skim milk it must be remembered that great care must be taken to have the milk always fed at the same warm temperature and to keep all pails and feeding utensils perfectly clean.

THE RELIABLE REMEDY



FOR CAKED UDDERS

DOUGLAS' EGYPTIAN LINIMENT

"I have now used Douglas' Egyptian Liniment for 2 years, and find it gives the best satisfaction for man and beast. I tried the liniment on 4 cows during the winter for lump in bag, and a sample bottle cured each case in 36 hours. I also found it good for muscular rheumatism and lumbago." (Signed)
Allan Schiedal,
New Hamburg, Ont

This Liniment will also stop bleeding at once and prevent blood poisoning

35c A BOTTLE

SOLD BY ALL DEALERS

DOUGLAS & CO., Manufacturers, NAPANEE

Where skim milk is not available, calves may be raised on hay tea. Boil cut clover, or even timothy, in water till a strong tea is obtained. Wean the calf from milk to this tea precisely as described from whole to skim milk. The same supplementary feeds may be used in somewhat larger quantities.

Pasturing the calf under six months old is not to be advised. The digestive system of a young calf requires a more concentrated food than that supplied by green grass, unless they eat an overdose of it. Moreover, the young calves are affected in their growth greatly by the heat of the sun and by flies. They will do much better if they can have the use of a darkened pen or shd during the day, as this will greatly reduce the annoyance from flies.

A strict observance of the following simple rules will generally prove satisfactory and cause very little trouble:

1.—Treat calves kindly and carefully.

2.—Use scrupulously clean food and pail, throughs, etc.

3.—Make all changes in food gradually.

4.—Feed only wholesome food in sufficient quantities, and feed regularly.

5.—Keep the pens dry and clean.

HEIFER HAS ITCH

I have a heifer that has what is termed a barnyard itch. I have used many different treatments, but she is still as itchy as ever.—G. F.

Barnyard itch is a wide term and does not convey any idea of the cause or variety of disease. One thing certain, if the heifer is allowed to rub herself against any post or obstruction in the barnyard the trouble will readily spread to other cattle. Such a disease dequires persistent effort in applying the remedy till it is cured. An evcellent and chap oily preparation is lineeed oil, four parts; common creosote, one part. Mix well together and rub on frequently at intervals for a day or two. Another very good prepartaion is made as follows: flowers of sulphur, on lb.; oil of turpentine, half a pint; train oil, four pints. Mix the sulphur with the train oil by gentle heat, and when old stir in the turpentine.

WATCH THE MILK CANS

There is nearly as much damage done to milk and cream by not watching the cans closely, as there is from lack of cooling. Do not put the cream or milk into cans after being returned from the ceramery or factory before thoroughly washing them. Although they are washed at the creamery, they become stale and smell bad usually before reaching the farm. Wash and thoroughly scald all cream cans before filling.

To produce the best milk and cream, adopt the following simple measures:

1. Keep the cows clean. The udders and flanks of the cow should be brushed regularly to remove dirt and dust. If the udder is wiped with a damp cloth just before milking, much dirt and dust will be kept out of the milk.

2. All utensils should be clean and sterilized. All pails and cans should be washed with a brush, cleaning powder, and finally rinsed with boiling water or sterilized with steam.

3. Keep the milk and cream as cold as possible, by putting the can containing it into a tank of cold water and ice and stirring frequently. Milk and cream should be held at a temperature of 50 degrees F.

4. The can of milk or cream, should never be left uncovered so that flies or dirt blown by the wind can enter.

5. Straining out the flies and dirt from milk does not leave the milk in a wholesome and clean condition. Bacteria when once introduced into milk by unclean methods will spoil the milk.

AGE OF HEIFER BY HER TEETH

How many teeth has a two-year-old heifer? Does she lose them all, and at what age? Should she be fed on bran and chopped oats and have her hay cut?

In general the age of the animal at the time each pair is up and in full wear may be estimated as follows: First or middle pair of permanent teeth at eighteen months; second pair at twenty-seven months; third pair at thirty-six months. Cattle have eight teeth in the front row. They lose two every year till atfer four years of age. It is not necessary to cut hay for them as the back grinders look after that duty. If given roots these should be pulped or sliced.

DE LAVAL

THE EVERLASTING CREAM SEPARATOR

There are thousands of voluntary letters in the De Laval Company's files, similar to this letter from Mrs. Pilgrim of Ontario, bearing out the statements made in connection with the long service of DeLaval Cream Separators.

In fact, by averaging up the years of use, it has been found that the average life of a De Laval is more than 15 years; and that during that time they have required little attention or repairs, and have produced the highest possible quantity and quality of cream with the least time and effort.

"We have used our De Laval for the last seventeen years and have had every satisfaction with it. Outside of rubber rings, it has never cost five cents for repairs.

'It is easy running, easily washed and kept clean, and when we need a larger separator it will be a De Laval."

MRS. G. H. PILGRIM,
Ontario

That is why there are more De Lavals in use than all other makes combined. Sooner or later you will buy a De Laval.

The nearest De Laval agent will be glad to demonstrate a De Laval If you do not know his name write to nearest De Laval office

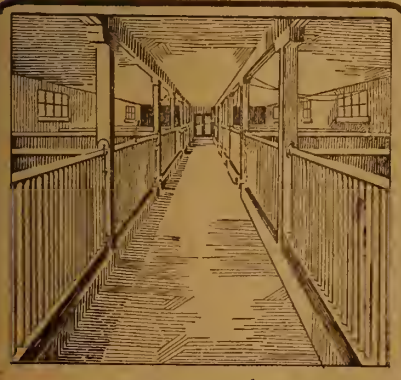
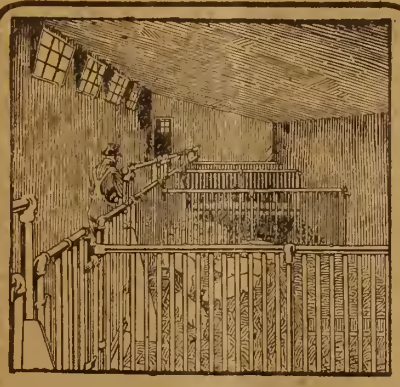
CANADA LOSES ONLY 33,000 POUND COW

It is announced that Zarilda Clothilde 3rd, DeKol, Canada's first and only 33,000 pound cow, has been sold by Colony Farm, Essondale, B.C., to Mr. John A. Bell, Jr., Coraopolis, Pa., for $15,000. Mr. Bell has now purchased over $100,000 worth of the best Holsteins Canada could offer, and in Zarilda he has secured one of the greatest, if not the very greatest milker the world has ever known. Her year's record of 33,145 pounds is surpassed only by a small margin by Tilly Alcartra, while her record of over 93,000 pounds milk for three consecutive years has never been equalled by any cow of any breed. While one cannot help but regret the loss to Canada of such cows, there is some satisfaction in knowing that she goes to a herd where only the best sires are in use and where she will have an excellent opportunity to reproduce herself. Just imagine what a bull calf from her would be worth, sired by Mr. Bell's $75,000 son of May Echo Sylvia.



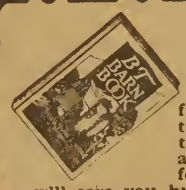
1. If your hog barn caught fire, could you use the pens again? The drawing above shows BT Galvanized Steel Hog Pens in the barn of the Ontario Hospital in London. This barn was burned to the ground, but the pens were used again.



2. Of course this saved the owners a big loss. Besides, BT Galvanized Steel Hog Pens are durable under ordinary wear and tear. There is nothing to rot; nothing to wear out; no planks to pull loose; no repairing to do.

3. Wood equipment is a constant worry and expense. Lumber is dear and carpenters scarce. Wood pens are not durable and in a few years must be renewed.

You can save money by putting in Steel Hog Pens. Send the coupon for details.



Send this coupon for our 352-page Barn Book. Tells how to plan, build, frame and ventilate the Hog Barn. How to save time, labor and feed in caring for the hogs. It will save you hundreds of dollars and is free.

LIVE STOCK.

CALF DISEASES AND THEIR REMEDY

If the death rate of calves and young cattle is to be kept down to where it should be, stock men should inform themselves regarding the causes of their present losses and some of the newer facts that have been found out as to the cause and the materials perfected for controlling these diseases.

Take white scours, for instance, a disease of new born calves which destroys nearly all the calves dropped on some farms and is such a serious menace to our cattle industry. The first signs of this disease are usually seen during the first few days of the calf's life and are noted first by the listless attitude the calf assumes, preferring to be down most of the time at first and taking no interest in the teat. He may show some signs of pain and cramps in the abdomen. He shows a hot, dry muzzle, indicating fever. Soon a whitish, foamy, bowel discharge is seen. Its smell is repulsive and characteristic. The tail and hind parts of the body are usually extensively soiled with this discharge.

Careful study has shown that this disease is due to a general infection of the whole digestive tract of the calf sometimes even before birth by materials swallowed so that in some cases the symptoms are apparent almost from birth. More often it is acquired in the mouth, to be subsequently swallowed because the teats of the mother are soiled from lying on the infected stable floors so that in suckling the calf is sure to get the infection.

If far advanced when recognized as ailing and the scouring profuse, the calf rapidly weakens and dies. In those cases tagen in hand early, however, and given curative doses of anti-white scour serum, good results are usually obtained.

The best control of this disease on the farm lies in the prevention of its starting at all. This can be accomplshed by remembering if it has occurred in the past that the stables and farmyard are well seeded with the germs sthat cause it and in consequence every effort should be made to clean up. This is especially true of stalls or sheds in which calving is to occur.

Throw out all old bedding, scrape the walls and clean the floors, thoroughly. Let in the sunshine, the best disinfectant we have. For places sunshine cannot reach use a generous spray of a good antiseptic in whitewash to floors and walls. Just before using the stall for calving, bed it well with clean bright straw that has not been tramped by the soiled feet of other animals.

Next remember to wash with soap and water, and later with a one per cent. solution of good dip in water the tail, udder, teats and hind limbs of the dam daily for the last few days before dropping the calf. When the calf comes it should be the aim to receive it on the cleanest surface possible to provide and at once have it vaccinated with anti-white scours bacterin which seems almost specific preventon of this disease during the past several years of trial.

Navel Ill Cause of Heavy Loss

This disease is often seen of late years in our calves and by some is called "Joint Ill," because it shows its most prominent symptoms as a swelling of come joint, usually the hock. It is due to germ life that enters the animal's body at the navel, hence its other name. These germs seem to live in the blood and finally localize in a joint where they produce pains, swelling, and often extxreme lameness followed by a general depression and frequently produce death.

All of the antiseptic precautions suggested above, if practised, will materially lessen the loss from this trouble as well, but in additon the navel cord should be tied off immediately after birth with a cord soaked in a strong antiseptic. It is a good idea to disinfect the stump by painting with tincture of iodine and let the cord be kept as dry as possible by the frequnt use of an antiseptic dusting powder.

A system of vaccination has also

been produced for this disease which is materially aiding in the prevention and cure of navel ill. Have your veterinarian use it early in any cases which may occur in your herd.

Thursh or Sour Mouth of Calves

Thursh is anotoher disease that is due to filth infection. It is usually localized in the mouth and manifests itself by loss of apetite and fever and a profuse slobbering. Close examination shows the mouth lining to be red and swollen, but in places showing yellow patches which easily slip off under pressure and leave a raw surface. Because of lack of appetite and absorption of poisons from the sore mouth many calves die from this infection.

Since this disease is due to infection with many filth germs getting in the mouth, the bucket fed calf is of course far more oftener affected than any other, since the dirty utensil is often the source of the trouble. Dirty udders may cause it in calves with the cow.

Its scontrol lies in practising greater cleanliness in handlng the food intended for the calf. Clean thoroughly by scalding the utensils which are at any time to hold food. Make provision that insures the protection of his food from contamination by any stable dust or filth, removing all articles from the stall or shed that calves can suck at, and lastly, isolate thoroughly all sick calves from the healthy ones. Do not handle healthy calves or their food after working with the sick ones until the hands and all articles likely to be contaminated in the hospital stall are well washed with antiseptic solutions.

For the sore mouths a little potassium permanganate solution in water used as a wash every few hours is good with salol in half drachm doses internally three times daily if diarrhoea is present, constitutes a good treatment.—J. A. R.

TO GET RID OF LICE ON CATTLE

Raw linseed oil is one of the best materials to use in treating cattle for lice. It is cheap and harmless if properly use. This oil is especially recommended for use during winter and under condtions such as our reader describes.

The oil is applied with a stiff brush having bristles of uneven length so that the hair will not become matted with the oil. The idea is to have the oil get to the skin and reach the lice. It is not advisable to rub vigorously when applying as this may cause the skin to burn. Neither must the animal be permitted to run out in the bright sunlight after oiling. The raw linseed oil and not the boiled or refined is the kind to use. The latter may injure the skin.

Four or five cows can be treated with a pint of oil for each treatment. The treatment should be repeated in from twelve to thirteen days and again in a month.

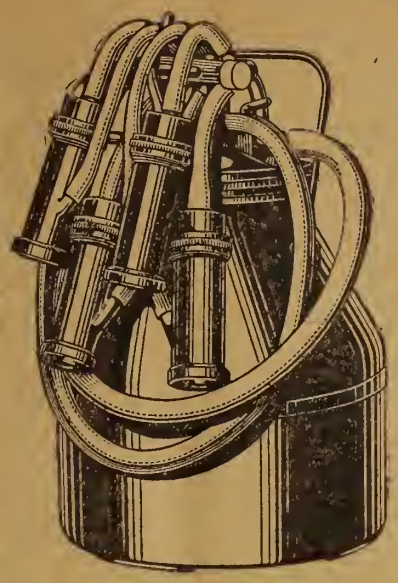
There are a number of dusting powders on the market under various trade names that can be used for treating cattle for lice but they are not considered by some authorities to be as effective as the oil mentioned above. Equal parts of powdered sabadilla or pyrethrum, sulphur and tobacco leaves makes a powder that can be sifted on the animals in cold weather as a makeshift until more thorough treatment can be given.

In addition to ridding the cattle of lice, the stables or stalls where the infested animals have been kept should be thoroughly cleaned and disinfected as a precaution against reinfection from dislodged lice and eggs. The littter and manure should be removed and the walls, flooor and all the woodwork sprayed with a good disinfectant.

Lice thrive during the winter when the hair on the cattle is thick and long. When the animals shed their old hair, the lice usually decrease in numbers or disappear entirely. For this reason treatment should be given as early in the fall as the presence of lice is noted. And the treatment should be thorough, the entire body of the animal receiving attention, even the inside of the ears, for a few lice left untouched will breed and soon reinfst the body again.

I have a pig that has all along done well, but about ten days ago it seemed to lose the use of its hind legs. It weighs about one hundred and forty pounds. It refuses to eat; I have been feeding it on whey, with oat and barley crop. W. J.

Your pig has been too well fed, with too little exercise. Barley should not be fed to pigs until they are about five months old. Your pig ration should include some green foods. You should let the pig have a free range for a while and withhold the grain ration. It will take a long period of time—if ever—for the pigs to regain its usual health, and at the weight of one hundred and forty pounds it might be the better policy for you to put him in the pickle barrel. If once a pig is overfed he will never consume as much feed thereafter as he otherwise would.



The DE LAVAL MILKER

Exclusive Advantages

The De Laval Milker is a distinctly different type of machine, positive and uniform in action. It is faster, more reliable and more sanitary than any other method of milking.

Among the many new and exclusive advantages in its construction are the following:

Udder Pulsator, close to cow's udder—insuring uniform, snappy action of teat-cups.

Pulsation speed cannot be adjusted or tampered with—always uniform and pleasing to the cows.

No pulsator springs, washers or regulating screws—pulsator has only one moving part.

Alternating action at fixed speed—the two front and the two rear teats milked alternately and uniformly.

Self-adjusting teat-cups—fit both large and small teats.

Pulso-Pump—especially designed rotary machine, providing the vacuum and the mechanical control of Udder Pulsator.

Sanitary design—every part is accessible, easily cleaned and sterilized. Many farms where the De Laval Milker is used market certified milk at top prices.

Write to nearest De Laval office for Milker Catalog, mentioning number of cows milked

THE HORSE

HOOF OF THE FARM HORSE AND TREATMENT IT NEEDS

About the foot of the horse much has been written, and it is safe to say that this part of the horse is less understood than any other. Furthermore it is the part of the animal that should exercise the greater part of the interest that all farmers or horse owners should take in their animals. The foot of the horse is so perfectly adapted for the purposes for which it is intended that it would be impossible to improve upon its formation. What weakness is found in the feet of horses is not due to natural causes but rather to the treatment they receive in their domesticated state. The conformation of the foot gives good indication of what the tendency of the animal's quality is for standing up or breaking down under heavy strain. Feet that might not be seriously objectionable, if the horse is to be used at slow work in the soft fields, might be totally unsuited to fast work on hard streets or roadways. Some horses have naturally erect hoofs and rather high heels. If allowed to develop naturally this type of hoof may not be objectionable, but they are often spoiled in the shoeing, the heel becoming so contracted as to cause lameness. On the other hand, there are feet that are flat and open at the heel, and the shell of the hoof so weak as to endanger the usefulness of the horse. The happy medium is to be found between feet that are too narrow at the heel and too erect, and those that are too open at the heel, and too flat and deficient in bony structure.

How Good Hoofs are Spoiled

Many animals that are born with good hoofs are found, when in the prime of life, to have their value reduced fully one-third, owing to the bad condition of their feet, through lack of intelligent interest being taken in them. In a case like this, even the selection of good footed parents in order to produce good footed offspring, will not overcome bad management of the feet of that well bred and well footed offspring at birth. In the management of the hoof, breeding right is the first duty, but it is not the only one. A colt born right, and of good inheritance must receive feet attention ere he finishes at the marketable stage to get the greatest value or is placed in the team in the fittest condition for hard work. Instead, not infrequently the colt is kept in the stable for half a year, and the feet consequently wear away but little. The place he has to stand on during that time is largely composed of his own manure and straw impregnated with urine. The ammonia thus generated stimulates the growth of the hoof, the parts that should be hard and firm are softened, and the frog of the hoof, that is soft and elastic in the best quality of hoof, is rendered abnormally soft and tender. This is the history of far too many horses, and animals that had by their birth the best chance in the world to become high-class animals. Abnormal growth in the hoof in winter confinement is one of the greatest known causes of subsequent diseases that arise in horses' feet when taken on for active service.

The Brittle Hoof

The most striking feature of the horse in domestication is the dry, brittle, and broken appearance of his feet at work in city or on farm. This is not natural to the horse. The hoof in nature is perfectly adapted to the animal's life, and the brittle quality of hoof comes by the usage they get in service. Time and again we have been asked the cause of brittleness in hoofs, and what to do to remedy the evil and restore them to natural growth.

There are many forces at work that cause the dry brittle hoof, and the broken and diseased condition that follows. Foremost among these is the general health of the horse. A hoof that is very much ringed and groved on the surface gives evidence of irregularity in the care and feeding of the animal. In stomach founder, the feet give the first indication by lameness, and when the attack is over a hard crusted ring is formed at the coronet, that remains till it is worn off by the growth of the hoof. Regularity of feeding, watering and exercise is the foundation for hoof building and any other artificial method cannot overcome the damage done by careless attention to the general health of the horse.

Among the duties included in attending to the horse, is that of the care of the hoof during sudden changes of condition and work that horses are liable to on the farm where severe work for a period is followed by a time that the horse is left to stand on a hard dry floor. The feet are transformed from a period in which perhaps a wet or damp condition has prevailed, as is found in the field or roadway, to a period in which the plank or cement floor of the stable keeps them in an overdry condition, in which the hoof slightly contracts. Even a few days' standing on a hard dry floor after a period of work is enough to damage the quality of the hoof. To modify this condition has not, as yet, become a practical science with farmers, and lack of this consideration tends to keep down the value of the horse, owing to his hoof condition. The front feet should be kept on clay, moderately damp, but not so damp as to soil the horse. Box stalls are best adapted for keeping the feet of horses in natural growth during idle days.

What Causes Hoof Trouble

The three causes of hoof trouble already mentioned, viz., selection at breeding, irregularity in feeding, and the alternate, wet and dry period, are all under the direct control of the farmer, but there is another cause that comes under the direct control of the blacksmith in the shoeing of the horse.

The hoof is developed by secretions from the coronet downwards. It consists in a pouring out of a plasma that forms a beautiful outer coating, that is almost impervious to moisture. The wall or outer covering of the hoof grows from the superior border to the inferior, and the increase of the wall being solely from above downwards, it does not require any reduction on its external surface. This natural coating of the hoof is all that is required, but some blacksmiths remove it with the rasp and then try to find a substitute in tar, oil or similar concoction. There is no substitute that can be found to take the place of the natural oily protective covering. When the natural oily surface is destroyed by the blacksmith's rasp, the moisture gets into the hoof rapidly and becomes too wet when exposed to wet conditions, and dries off as rapidly when dry conditions prevail.

Insures long life

Imperial Mica Axle Grease and Imperial Eureka Harness Oil insure long life for wagons and harness. Put up in convenient sizes and sold by dealers everywhere.

Imperial Mica Axle Grease
—not only lubricates, but smooths the surface of the axle and hub with a coating of powdered mica, thus reducing friction and lessening the strain on horses and harness.

Imperial Eureka Harness Oil
keeps harness straps and tugs pliable and strong, prevents cracking and breaking of stitches. It preserves harness against the action of sweat, moisture and dust, also wards off insects. Imperial Eureka Harness Oil imparts a rich, black, lasting finish.

COOKSHIRE, Que. 101

about the very congested city districts where trucks will never be profitable on short hauls, the long winter months, in most northern sections, during which tractors will necessarily be idle, the hilly or even very rolling farms where too much power is lost in propelling the machine itself, it is clear that the horseless age is still very far distant. That the automotive industry is rendering a service to the country at the same time as it is piling up dividends is certain; that it will in time crowd the horse away from farms is not believed by anybody who has given the question serious consideration.

Drafters have always and will always be profitable to the breeders who produce them. But there are a large number of farmers who like a good general purpose animal, one that can be hitched to a carriage without looking out of place, and that can take his turn at farm work with a willing disposition, a fast walk, lots of courage and endurance. To pretend that draftes are the only class of profitable horses to raise is to go too far, just as it is not right to say that tractors or trucks are always the most economical for the farm or the city.

The old time French Canadian pany, as he was called, was admitted to be a little horse of iron. The first animals of this breed came to Canada from France where they were chosen amongst the best to be had. Through natural selection, by the survival of the fittest, only those remained which had the most vitality, enough to withstand the cold climate and the deep winter roads of their new country. This made of them a breed which can probably develop and keep on developing more power per hundred pounds of live weight than any other one. Their qualities were so well known that they were used to form certain families of the Morgan and of the Standard Bred, so that their blood is flowing in the veins of some of the gamest and fleetest horses in America. The Honorable Sydney Fisher has well said of the French Canadian: "He never gives out, it does not matter what he is at."

There are now four stallions with fifty mares and fillies, all pure bred and registered, at the Cap Rouge Station and at the new St. Joachim Horse Farm. These are used to study problems of breeding, feeding, housing and management. They form, it is freely admitted by all, the largest and best stud of the breed in existence to-day. One of the points towards which efforts are concentrated is the production in a fairly consistent manner, of a breed of horses weighing between 1200 and 1300 pounds, which may be used either on the road or on the plough, a low-set, thick animal, with a short back, a strong loin, giving him a general conformation whirh will make him an easy feeder and a sheap producer of power.

Whoever is interested in this class of horses will be quite welcome either at Cap Rouge or at St. Joachim. Both Farms are under the superintendence of the writer, who will be pleased to give by mail any information required by those who cannot visit the two above-named Farms.

Gus Langelier, Superintendent,
Exerimental Station,
Cap Rouge, Qhe.

WORMS IN HORSES

There are three different varieties of worms in horses each requiring a different treatment. There is the stomach bot, the intestinal worm, and the pin worm.

For the stomach bot and the intestinal worm give the horse twice daily in the feed a tablespoonful of a mixture of two parts of table salt, and one part of flowers of sulphur and dried sulphate of iron. Continue this for a week, then stop for ten days and repeat again for another week. Omit the iron for a pregnant mare and increase the salt and sulphur.

For pin worms that live in anus the treatment should be by injections up the rectum, and for the injection mix two drachms of turpentine in a pint of raw linseed oil. Do this every morning for a week. The injection will be aided by a purgative dose of five to six drachms of aloes, also by cleanliness and smearing the anus with mercurial ointment.

HORSE HAS THRUSH

I have a horse that is troubled with thrush. I am washing his feet out with warm water every day and dusting them with a solution of sulphate of copper. Will this treatment effect a cure.

Ans.—The treatment is incorrect, as frequent washing tends to aggravate thrush, or at least hinder healing. The disease is caused by the horse standing in wet and filth in the stable. Perfectly cleanse the stall, then keep it clean, dry and bedded with sawdust or shavings. Cleanse the cleft of the frog and on each side of it, and cut away all loose, under-run or rotten horn of frog or sole. Then pack into the cleft of the frog and other crevices a mixture of equal quantities of calomel, powdered alum and tannic acid, and cover with pine tar and oakum. Remove the packing once daily until well.

ABSORBINE STOPS LAMENESS

Carhartt Overalls

F6

PLOUGHING or work requiring much muscular exertion proves the great strength of Carhartt Overalls. For one thing, in making my Carhartt Overalls, I use first-grade denim entirely. Suspender buttons are on to stay because they are riveted on reinforced bands. Suspenders are interlaced so that they cannot slip off the shoulders or separate in the wash. This is my own idea. You know what a nuisance it is picking up tools and rules when you bend over. The swing pocket stops all that. My Carhartt's are made in generous sizes, easy to put on, and have plenty of room for give and take. They have all the comfort devices you require in overalls—and the price is reasonable.

MARKETING POULTRY

I seriously regret my inability to appear before you to-day, not only because it is my first opportunity to meet the membesr of the Farmer's and Dairymen's Association in convention assembled, but because of the great world-wide interest being taken in marketing problems to-day. Never before in the history of any industry was so much interest directed to the marketing end. And rightly so. That applies even more so in regards to poultry and poultry products in New Brunswick than to any other industry.

The Future of the Industry

The whole future of the poultry industry in New Brunswick hinges on two points. The one is economic production through stock improvement, proper care and management, and early hatching; the other is the marketing of our poultry products so as to conserve that quality and flavor which is nature's contribution, and give as great a remuneration to the producer as is possible.

As to the former I shall say nothing, except that it is being taken care of very ably by Mr. A. C. McCulloch, Provincial Poultryman. Through Mr. McCulloch's wide experience and his acquaintance with breeders and breeders' strains, he has been able to introduce into New Brunswick a strain of Rocks that is second to none in Canada. As to the latter I'll have more to say.

When to Market Fowl

The first problem in marketing is one that is allied very closely with the production end of the industry, and that is the marketing of fowls during latter June, July and August. Investigations in the industry have made such progress during the past five years that it is now possible to pick the profitable hens from a flock and discard unprofitable ones. After a hen has gone through a winter's production, certain observations, such as lack of yellow pigmentation in the shank, dry, harsh plumage and flexibility of the egg sac signify that she has been a producer. On the other hand the hen that passes through a winter's production with yellow pigmentation in the shank, a fresh, loose oily plumage, and a fleshy egg sac has in all probability been a loafer and not a layer. Now, when you consider that during June, July and August the price of such fowl is usually the highest of the year, it seems rather logical that that is the proper time to market. You have the best opportunity to apply the observations referred to, the price is at its best, you save further expense of keeping non-producers and instead of perpetuation a non-producing flock you can weed out the poor layers and gradually build up your flock.

Dressing for Market

There is another problem and a very important one confronting the people of New Brunswick, both consumers and producers. That problem is the mareting of poultry scalded and drawn with heads and feet off, as is being done at the present time. The skin was put on the bird for the same reason it was put on man—for protection. Once you break that skin you expose the flesh to whatever destructive decay or disease bacteria with which it may come in contact. When you open the body cavity of the bird and remove the crop, the whole interior is exposed. Nature never meant it to be exposed. If you expose it not only do you render it liable to the contamination of disease producing organisms of the atmosphere, but you detract from the flavor and wholesomeness of the flesh.

You take the case of disease itself. The head is a bird's health certificate. The internal organs are the seat of disease. Chicken pox appears on comb and wattles; tuberculosis attacks lungs and intestines; black head attacks liver and intestines. But when the head and the internal organs are in the garbage can and the carcass is on the market, how is the consumer to know he eats a healthy bird?

Other provinces outside New Brunswick and Nova Scotia market their poultry bled in the roof of the mouth, dry plucked, undrawn with heads and

feet on. Boston and other American markets demand them undrawn. Then the development of the industry in New Brunswick depends on the method of dressing. When we can produce more than will supply our home demand—and that time is not far distant—we will have to look to outside markets. Outside markets demand poultry undrawn, so it becomes essential that New Brunswick supply it undrawn.

What About Eggs?

A nation's greatest market is its home market. Canada produces over 165,000,000 dozens of eggs. She exports only a few million dozen. Our problem is to look after home marketing and our export trade will look after itself. We, in New Brunswick, do not need to worry about export because so far we are importers of eggs. We are not self supporting in our egg trade. We import from other provinces, and the only figures I can obtain of importations go to show that we are importing storage eggs and the lower grades of fresh eggs, which are being retailed out as fresh eggs. The egg, of course, is a commodity which no manner of storage or handling after it is laid can improve its quality. The egg is not like cheese. It does not improve with age. Then the problem is to get that egg from the producer to the consumer, with as much despatch as possible.

Our Present System

Under present conditions where every farmer keeps a few hens, no one has enough eggs to make it worth while to market regularity. Eggs are kept two or three weeks and then they are marketed at the local store. The store-keeper has no cold storage as a rule and eggs are liable to deteriorate in his keep. So it is all along the line. The quality deteriorates as the egg goes on its journey. We cannot help that, but we can shorten the journey.

At present eggs are bought at a flat rate per dozen regardless of quality. A dozen rotten eggs bring as much money as good eggs. Who knows what is inside the shell? There is no incentive for the producer to take better care of his eggs. But you go into a store and everything you buy you buy according to quality. You pay according to quality.

The Solution

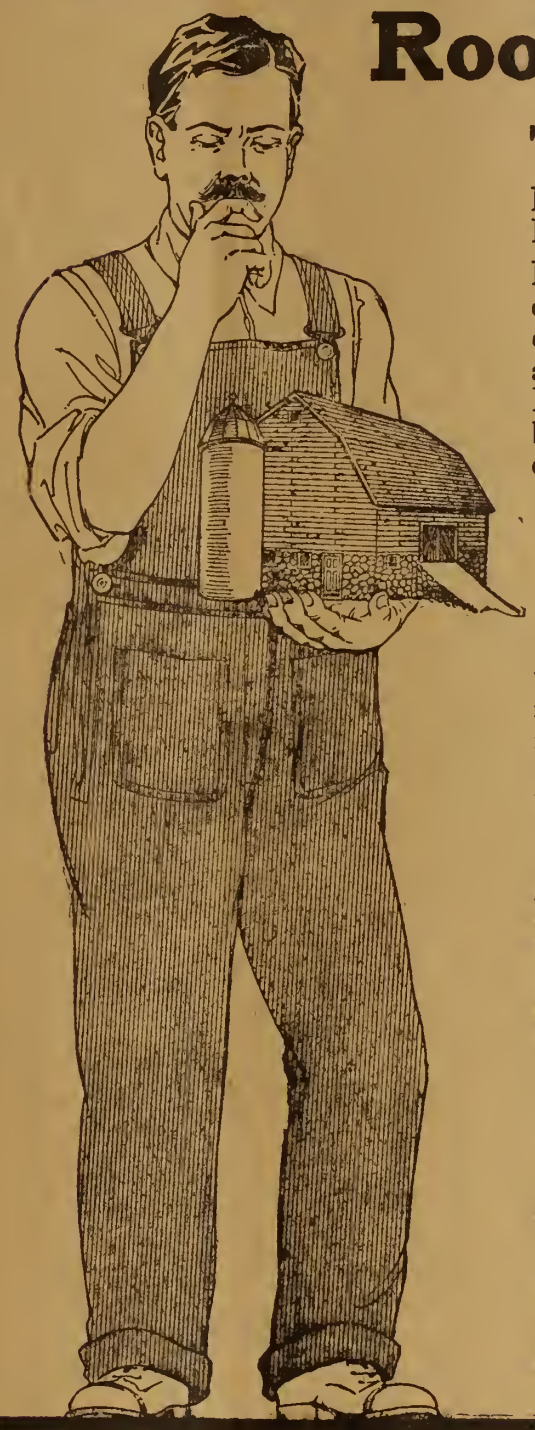
The problem then is to get volume of eggs sufficient to make regular frequent marketing possible, and to have quality payment so as to induce better care of eggs on farms and in transit. The logical solution seems to be organization of Co-operative egg circles. An Egg Circle is simply a local organization with a manager who collects the eggs from the farmers door weekly and markets them to the best advantage possible. That gives quantity sufficient to make regular marketing practical and gives the man with a few hens as good a chance as the man with many. As organization goes on we would, no doubt, have volume enough to start a candling station as is operating in Prince Edward Island. Then we can see what is inside the shell and pay the producer for the quality he produces.

Conclusion

To you men here assembled in convention let me say this. The marketing of your produce is your problem. It is not sufficient for you to listen to addresses from this platform. It will avail you nothing if you do not act for yourself. Let me ask that you consider the marketing of your poultry products in your own section and if any suggestion I may have dropped will apply by all manner of means apply it. We must have your co-operation in our work. Your markets have to be improved. When a suitable market is available, production usually looks after itself.

GEO. R. WILSON.

Paroid Solves Your Roofing Problems



TO receive roofing satisfaction whether on a Barn, Warehouse, Railroad Building or large Industrial Plant, consider the following points.

Roofing must primarily give continuous service under every weather condition. It must be easily laid—adaptable to every description of roof. Further, roofing once laid should not become a liability through requiring constant repair.

NEPONSET PAROID

withstands hard and continuous wear, and is adaptable to all roof surfaces. Cheapness of first cost, as compared with wood and metal shingles, or slate, and economy of maintenance are some of its principal features.

The base of Neponset Paroid is a high grade rag felt thoroughly impregnated with asphalt, making it positively water-proof and fire-resisting.

It is further reinforced with a talc surface, grey in color; or with a permanent slate surface, red or green in color.

EASY TO LAY — With every roll of Neponset Paroid is supplied sufficient nails and cement with full directions.

Ask the Neponset dealer in your district, or write to us for an interesting booklet, "Roofing Canada"

NEPONSET ROOFS

INCUBATION AND BROODING OF CHICKS

(Experimental Farms Note)

Which is it to be, hens or incubators? If less than 100 chicks are to be hatched it is not generally considered advisable to buy an incubator, but if more than that number are wanted it is almost a necessity to have an incubator. If hens are used, select only birds that appear to be determined to set and are not clumsy or nervous on the nest. Do not allow hens in the same pen with setters. Be sure that your hen is perfectly free from all vermin and see that she has a supply of fresh water and some whole grain every day.

If artificial methods are used, a well ventilated cellar with a fairly even temperature makes a suitable location for the incubator. Buy a well-made machine of a well tested make. Study the general directions sent with each machine and have it started several days before trusting the eggs to it.

The first essential of a good hatch whether under hens or in incubators. is to have eggs from healthy, vigorous breeding stock. The fresher the egg the better chance of a good hatch. Select only eggs of a normal size, discarding all rough, uneven, thin shells or any peculiar or abnormal shape. Do not allow the eggs to become chilled before being set. Give the hens or incubators a fair chance with good hatchable eggs and under most conditions they will produce good healthy chicks.

To be successful in the brooding and rearing of chicks requires constant care and attention to details. If chicks are hatched by hens, let the hen remain quietly on the nest until the chicks get so lively that they insist on leaving it, then remove the hen with her brood to a coop previously prepared for her. All coops should be thoroughly disinfected before use each season and also between broods.

A hen should be given no more chicks than she can keep comfortably warm. The artificial method requires a brooder so made that it will be possible to produce and hold heat enough to provide for the comfort of the chicks in any weather, easily and well ventilated. The chicks should be left in the incubator until perfectly dry and great care must be taken to avoid chill in changing them to the brooder. The brooder must be almost the same temperature as what they were accustomed to in the incubator for a start. Extremes of heat or cold are very disastrous.

Chicks require no food for 48 to 60 hours after being hatched, as a chick when it leave the shell has a sufficient supply of nourishment to last it for several days. Feed small quantities

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Shbjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N. B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

ARE YOU ONE?

There are people in the world who have the gift of finding joy everywhere and of leaving it behind them wherever they go. Their influence is an inevitable gladdening of the heart.

WHEN LOVE CAME TO PEGGY LOU

By May A. Feehan

(Continued from last issue)

THE STORY

When John Charles Turner was four years old, he prayed for a baby sister. Imagine his joy, then, when one day his father came down telling him he had a new baby sister up-stairs. Peggy Lou grew into a beautiful girlhood and then was taken with a terrible fever which threatened to make her a permanent invalid. She recovered sufficiently, however, to be carried down every day to the big front porch, where a sort of shrine had been established for her. This was called Peggy Lou's Corner. A great many friends came here daily to worship at Peggy Lou's shrine.

DR. GORDON became a frequent caller at Peggy Lou's corner. Dr. Thomas' practice was not large, and just now, there was little sickness in Terella. Peggy Lou found Dr. Gordon delightful; she encouraged him to talk of his work in Louisville and surprised him by her knowledge of just such subjects—her family had not been able to stifle her in her reading, thank heaven for that. Leaving the corner, Dr. Gordon wondered at himself; egotism was something he despised and yet, for the better part of a morning, he had been discoursing on Philip Gordon, M. D.

"I really never did this before," he laughed one day. "I believe it is your fault; you are a witch, Miss Peggy Lou!"

Peggy Lou smiled happily, a warm glow at her heart. No man had ever called her that before in just that tone—Something woke in Peggy Lou. That night in bed, she wished more than ever that she could be like other girls, could go to dances and stroll at night under the big, spreading trees and, in her pictured strollin, alas, her companion was not John Charles!

There was one strange thing about Dr. Gordon. Peggy Lou spoke to John Charles about it.

"He never waits on me; he's lax almost to rudeness. I dropped my handkerchief today and he let me pick it up myself and when I wanted to show him an article in a magazine I had to reach to the table for the book.

"That is strange, for he seems a nice fellow; I like him," John Charles said. "Perhaps he just doesn't know—"

But Peggy Lou did not agree. "No, it isn't that; he is most courteous to everyone else; I don't understand it."

Peggy Lou received many just such shocks and, at times, was reduced almost to anger that she was obliged to wait on herself when Dr. Philip Gordon called. Even Mammy Turner failed to appear to look after her "honey chile."

"I go out on that veranda with that loctor a'sittin' a'frowin' at me? Not this yere nigger," she announced to her clientile in the kitchen. He's a bad man." She had never seen a doctor like this.

Dr. Gordon attempted to suggest that Peggy Lou exert herself; he even proposed her taking a few steps one day, to Peggy Lou's dismay.

"Please don't ask me,' 'she begged hating to refuse him. "I did it once. I really am not able; my heart, you know."

Dr. Gordon wisely said nothing, but Susie McAllister calling at that moment, he devoted himself to her and took his departure when she did. Peggy Lou, with a tightening round her heart, looked after them as they strolled homewards. Susie was said to have a way with the men, and, watching them as far as she could, Peggy Lou even sat up unaided the better to see; Susie was living up to her reputation, for Dr. Gordon was looking down at her, laughing at her remarks.

IT was Peggy Lou who that night announced to her family that she intended having Dr. Gordon examine her heart. Dr. Gordon said nothing when John Charles called during office hours and repeated Peggy Lou's request, but he had difficulty in repressing a smile.

The next morning as he went up Maple Street and entered the Arnott gate, he was aware of an uncanny stillness. Peggy Lou's corner was vacant and Mammy Turner, trembling of hands and wildeyed, opened the door and whispered that "The fambly's up in Miss Peggy's room."

"What's wrong, any one dead?" Dr. Gordon questioned cheerfully.

"Ain't nobody dead, it's the examination." Mammy Turner broke into loud weeping and fled toward the vicinity of the kitchen.

"Great Jumping Jehosophat!" the doctor mumbled as John Charles, hearing his step on the stair, quietly opened the bedroom door. On the bed lay Peggy Lou; beside her, holding her hand, sat her mother, while the Judge filled the same offce on the other side of the bed and all about was th stillness of death.

"Hello, everybody," the doctor said unceremoniously, "what are you doing up here? You should be down in Miss Peggy Lou's corner this beautiful day."

Whispers were his only answer, and attepmted further remarks in conversational tone brought forth such subdued replies that the doctor, to his disgust, found himself imitating his audience. His examination was very brief, then he looked about him. At the mother, sitting beside Peggy Lou, a monument of complacent martyrdom; at the Judge with his satisfied expression of "I told you so;" at ohn Charles hanging breathless over the foot of the bed with Mary Cleveland close beside him. Dr. Gordon swallowed hard and prepared for the storm.

"You know what is wrong, don't you?" he said shortly. "Nothing is wrong!"

He expected an avalanche of protest, a storm of remonstrance, and his anger rose at the sight of the pitying incrdulity which smilingly appeared on the face of every one of the five in the room. Would nothing rouse these people! Well, he would save Peggy Lou in spite of them, in spite of herselm, lying here and smiling at him with her big eyes as though to say, "You poor dear, you are very nice and I like you, but as a physician—!"

Dr. Gordon could be brutal if necessary. He looked at them again and glanced once more at Peggy Lou—he would fight for her if necessary—His heart smote him; he was going to hurt her.

"Miss Peggy Lou is just too lazy to live!" He snapped out the words.

There was a terrible pause, a pause so long that Dr. Gordon counted the toilet articles on Peggy Lou's dressing table twice. The pause was broken suddenly, broken by a great sob from Peggy Lou. Mrs. Arnott, with a look of hatred at Dr. Gordon, gathered Peggy Lou against her breast while Mary Cleveland ran to the bed and encircled them both with her arms. Judge Arnott fairly towered in his anger.

"I shall ask you to leave my house, sir," he said, pointing an accusing finger at the door which John Ccharles held open, looking past the doctor, who made as graceful an exit as possible under the circumstances. But he was far from pleased, even though he reassured himself that he had done the only thing possible: roused these people to anger, for Dr. Gordon knew that action often followed once anger has cooled. But Peggy Lou's sobs followed him, dear little Peggy Lou of whose head he would not harm one hair!

Old Dr. Thomas was much worried that evening to find that his nephew ate nothing and started nervously whenever the telephone rang.

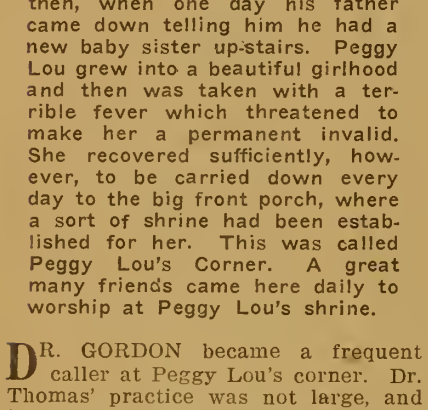
The next morning's mail brought a check for professional services from Judge Arnott which Dr. Gordon promptly destroyed, and he heard nothing further until, sitting quietly reading some evenings later, old Dr. Thomas having retired early, he was startled by the figure of John Charles in the doorway. John Charles was much embarrassed, so much so that he disturbed the equanimity of the older man, who managed somehow to push John Charles into a chair and take his hat.

"I—she—that is, we, owe you an apology for the other morning; we shouldn't have been so—" John Charles began nervously, to be interrupted by the doctor's laughing, "Nonsense, I didn't blame you one bit!"

That was all that was said, even though John Charles remained some time, the doctor realizing that John Charles wished to say more but forestalling him with one anecdote after another of his Louisville experiences. As his visitor rose to go, Dr. Gordon remarked. as though the eventful heart examination had never taken place:

"Please tell Miss Peggy Lou the book I promised her has arrived and I shall be up with it in the morning." And at the brightening of John Charles' face Dr. Gordon learned the reason for this unexpected visit. If his heart beat faster as he stood in the doorway watching John Charles' slim back disappear in the moonlight, it was but natural. Peggy Lou wanted him to come back. John Charles, with al lhis attempted subtlety, had let that fact slip. Only a request from Peggy Lou would cause John Charles to humiliate himself. A strolling couple caught the doctor's eye and he looked after them dreamily, wishing that he, too, were walking under the shadowing trees, but the companion of his little romance was not Susie McAllister.

And the world revolving around Peggy Lou's corner went on its untrammeled way, apparently. In reality there was an undercurrent of change there. Judge Arnott caught himself, more than once, looking at Peggy Lou critically, a wondering in his mind, dismissed as disloyal almost as soon as lodged there, if she might exert herself a little more. Mary Cleveland, catching that glance, flushed guiltily. Mrs. Arnott worried an



ROYAL YEAST CAKES

are now packed in square packages. Each package contains five cakes, which are equal in quantity to six round cakes. All dealers are authorized to guarantee that the quality of the round and square cakes are identical in every respect.

entire day because Peggy Lou, in bed that morning, had insisted on sitting up and aranging her hair herself, using as her guide a New York magazine. Later in the day, hearing Dr. Gordon's praise of the new style rather than the old fashioned of two braids down her back, Mrs. Arnott was enlightened, but she worried all the more and shed many bitter tears for poor Peggy Lou who could never marry.

To John Charles everything was the same, everything peaceful and happy. Mary Cleveland had extended her visit another month. If marriage was not for John Charles, at least he could look at Mary a whole month longer; he loved to look at her, to watch the play of light on her hair, to see her faice brighten at his approach. Peggy Lou saw these things, too, saw them and grew more determined.

Yes, everything was the same to John Charles until one night, fearing burglars in Peggy Lou's room at the sound of stealthy movement, he quietly tiptoed and looked in the door. John Charles received a shock. Peggy Lou was walking! Clinging to the foot rail of the bed, it is true, but taking uncertain steps, now the length of the foot rail, now back. At John Charles' whisper of astonishment she sank to the floor but when he, terror in his heart, reached her, Peggy Lou was not fainting, she was laughing! John Charles' world tumbled about his ears.

"Don't tell anyone, don't tell," she begged, between laughter and sobs. "He said I was too lazy to live. Well, I'l lshow him."

"But little sister—" John Charles began as he helped her to her feet.

"I've been walking for a month. At first I was terribly frightened, I crawled to the foot of the bed and touched one foot to the ground like a swimmer testing the water in a pool; then I stood up, hold to the foot of the bed—"

"You brave darling, why didn't you let me help you?" John Charles interrupted.

"When I found I dd not faint, I got in bed again and lay there shaking. The next night I took one step forward and one back and knew that I could walk. The tenth night I found myself at the middle of the footboard and realized that I should have to go on in order to reah my pilloy again. I have been a month doing this, John Charles, but I'm not too lazy to live, am I?"

A great light broke over John Charles. Little Peggy Lou in love—it was preposterous! Why Peggy Lou was a baby, a little round thing of filmy white dresses and dark, bobbing culrs. He looked at his sister in a new way, a feeling almost of fear at his heart; his little sister in love!

"I'll not tell a soul, I promise you, and I shall help you tll I can," he told her. "Do you think we could have Mary in on the secret? We could come up here every evening," he begged wistfully.

Dr. Gordon caller often, and less considerate than Stewart Blackman or Jonhson Bridges, he did not arrange his visits so as to avoid conflicting with their days. Stewart, hotheaded and truly Southern, amazed John Charles when they met at the noon hour, by railing and storming at the doctor, while Johnson Bridges, driving his car viciously out the Calvert Turnpike, complained bitterly that, "Hang it, I like the fellow, but he's been there the last five times I've called, and, for all I know, is planning to be there for five times more."

Yes, Dr. Gordon called often and rode rough-shod over the visitors. It was not that he was rude or said anything; he said very little and was polite to a degree; he even teased Susie McAllister, pulling her three bobbing curls. Peggy Lou caught herself wishing that the curls would come off and show Susie's artificial nature. Then realizing that she herself was a wretch, she repented promptly and punished herself by begging Susie to remain and have dinner with her in the corner, the reward for this virtuous act being a heavy scowl from Dr. Gordon which fortunately Susie did not see. As a result of such cavalier behavior Dr. Gordon was not asked to stay and he certainly expected an invitation. But he needed a lesson; he was becoming entirely too masterful.

"Have you always got everthng you wanted?" Peggy Lou asked one morning after Stewart Blackman left an hour earlier than usual.

Dr. Gordon laughed heartily.

"Caught in the act," he confessed. "How did you guess that I have been sitting here wishing Stewart away? I am beginning to believe that you are a mind reader, and I, something of a hypnotist."

"You are a dreadful person. I am

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Write for free trial treatment.

Do Not Neglect The Bad Cold OF TO-DAY IT MAY BE SERIOUS TO-MORROW

May Develop into Bronchitis, Pneumonia and perhaps Consumption.

Miss Mary Prouse, R.R. No. 1, Cedardale, Ont., writes:—"I had the Influenza in November last, and it left me with a terrible cough. I did not attend to it until it got so severe people warned me it was time to see about it. I went to the doctor and got some medicine. He told me it was a bad attack of bronchitis. I could not sleep, and would have to sit up nearly all night, it was so difficult for me to get my breath. The doctor's medicine did not seem to be helping me the least bit.

One of our neighbors came in one day, and told me about Dr. Wood's Norway Pine Syrup. I tried it and took two bottles. No person could believe how it helped me. I have recommended it to different people since, for I believe I have reasons for doing so.

Dr. Wood's Norway Pine Syrup has been on the market for the past 30 years, and stands out by itself as a remedy for all coughs and colds.

Be sure and get the real "Dr. Wood's" when you ask for it. Put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

beginning to believe that I am afraid of you; you may try your arts on me," Peggy Lou said, to be silenced by Dr. Gorodon's "I wouldn't harm you for the world, little Peggy Lou, you know that."

He Has Tried Them And Got Results

WHY J. A. MacLEOD PRAISES DODD'S KIDNEY PILLS

Nova Scotia Man Gives the Reason Why He Advises Sufferers from Kidney Trouble to Use Dodd's Kidney Pills.

River Dennis, N. S., April 27th. (Special.)—"Dodd's Kidney Pills helped me wonderfully. My back is better and as I haven't taken any other medicine since starting to take them, they must have done me a lot of good."

In these words Alexander J. MacLeod, a well-known resident here, gives his reason why he praises Dodd's Kidney Pills and why he says, "I would advise anybody who has kidney trouble to give Dodd's Kidney Pills a trial."

The reason Dodd's Kidney Pills are popular all over Canada is that the people have tried them and found them good. Dodd's Kidney Pills have been in use in Canada for more than thirty years. They have been used by thousands of people suffering from various forms of kidney trouble, such as rheumatism. dropsy, sore back, weakness, diabetes and Bright's disease.

Ask any one of these thousands to give you his opinion of Dodd's Kidney Pills. It is on the relief afforded sufferers from kidney trouble that Dodd's Kidney Pills have built their reputation as the soveriegn remedy for sick kidneys.

He had never called her Peggy Lou before nor talked in that tone of voice. Peggy Lou feared that he could hear the beating of her heart or that its vibration would shake her off the couch on the veranda floor. He no longer said Miss Peggy Lou. She wanted to sing but it would never do to let Philip Gordon know her joy. Philip! What a good sounding name it was! Peggy Lou decided that she loved it and was about to comment on it when something she saw in Dr. Gordon's face made her say hurriedly:

"But you haven't answered my questoin." Still dangerous ground, but one had to say something.

Dr. Gordon settled back in his chair and smiled as though to say:

"I see through you, young lady, but thre's another day coming." Then he suddenly leaned forward.

"No, I haven't had everything I wanted. Some people might say so, but the biggest thing in life has been denied me—a home! I haven't had a home since I was ten years old, almost too long ago to remember. And I do want one. You can't imagine how I haev pitcured my home; my desires are modest. I don't want a marble palace," he laughed. "I want a little house, all on one floor, with great windows and a wide veranda all round, and inside I want pretty hangings. You know, the kind that women know how to buy, roses and things like that in the pattern. I want lamps with soft, rose-colored shades all over the place. I've always liven in a man's rooms; now I want something different. I must have a big open fireplace, too. It grows cold here during the winter, doesn't it," he asked anxiously.

Peggy Lou's heart sang, "He is going to stay in Terella; he is going to stay," but she answered his question quietly:

"We haev very cold weather sometimes.

"That settles it," Dr. Gordon said happily. "Now my house is furnished."

"But you haev forgotten chairs and tables and pictures and—and other things," Peggy Lou said, vainly trying to think just what people did buy in order to furnish houses.

"That can wait. I am going to buy the house tomorrow."

"You intend to stay in Torella?"

Dr. Gordon looked off toward old Dr. Thomas' house, the red roof of which could be seen through the trees. "Yes, I'll not leave him," he said. "My house is to be the one just next door to his, the old Johnson place. Dr. Thomas s much improved now, but he has lived alone so long with old Mary to look after him, that I feel that I bother him, but the ideo of having me near him is a joy to him, I know. The dear old gentleman can't live many years longer, another stroke will mean the end, and I shall feel safer nearer him. No, I havent't had everything I wanted, Peggy Lou," (again he forgot the Miss, to Peggy Lou's joy) "but now I have a home planned and—and—no, I haven't everything I want—" he swallowed the remainder of the sentence.

And for the first time in her life Peggy Lou wished that John Charles did not come home so early at noon.

John Charles looked after Dr. Gordon as he hurried away.

"Funny fellow, Gordon. Sometimes when I come home he appears to be delighted to see me, just now he looked as though he could wring my neck. Where's Mary?" he asked suddenly changing the subject to Peggy Lou's relief, and went off singing and calling for Mary Cleveland.

It was late afternoon a week later that Susie McAllister rushed up the steps and fell into a chair in Peggy Lou's corner.

"Oh, Peggy Lou," she gasped, "I am on my way home from the club but I just had to stop to tell you, Dr. Gordon is going to live in Terella.

Isn't it grand! I just met him; he is having the old Johnson place fixed up and he wants me to come ond see it in a few days. He was on his way there now to open boxes, lamps and things," and Susie was off, but she stopped on the lowest step to call back, "You look darling in that new dress, Peggy Lou."

Peggy Lou's lip curled as she looked after Susie, the three bobbing curls fairly bouncing under Susie energetic heels. Susie McAllister see that house fiarst; see the lamps with rose-colored shades, select the hangings with roses and things like that in the pattern—! John Charles roadster was at the curbstone. Many a night recently, John Charles had helped her to the car and togefher with Mary Cleveland squeezed in the seat they had ridden far out on the Calvert Turnpike. John Charles had taught her to start the car and stop it.—Susie McAllister might think she was going to see the house first—!

Peggy Lou clung to the railing as she went down the front steps, but the low car offered no difficulty in getting in. She looked up at the win-

Live To Old Age in Comfort

Much care is advised to men and women who are just turning forty.

At forty, many ailments that have lain dormant, become active. Kidney and bladder troubles show themselves, and it is only through exercising great care and caution can these dread diseases be overcome.

At the first sign of pain in the back, or across the groins, or when dizziness, constant headaches, swollen joints, rheumatism, sciatica or gravel bring suffering or discomfort take

Gin Pills FOR THE KIDNEYS

Gin Pills, taken in time, will prevent serious complications. They strengthen weakened kidneys, relieve congestion, soothe inflammaton, and help the vital organs to purify the blood so that the poisons, uric acid and waste are duly elimiaated.

Gin Pills contain no alcohol. Their great efficacy depends on the valuable principle derived from the Juniper Berry, which, combined with seven other valuable diuretics and antiseptics, result in a pill that is, we believe, the best ever prepared for allaying the pain caused by deranged kidneys.

Get Gin Pills from your druggist or dealer—they are sold for 50c. a box—with a money-back guarantee.

dows of the house; no one saw her go. Fearfully she did as John Charles had taught her and almost screamed as she felt the wheels turn under her. It was amazing and exhilarating the way she turned the corner into Main Street. Peggy Lou increased the speed and droev down the street so quickly that people looked after her; no on recognized her and a report went around that a new and wonderfully good-looking girl was visiting in town.

If she shouldn't be able to stop! Visions of riding, perhaps for days, until the gas would exhaust tself, rose before Peggy Lou. But no, the roadster behaved beautifully; it came to a halt just at the gate of the Johnson place. Peggy Lou timidly opened the gate and went into the yard, a yard rather tumbled and torn but with great possibilities of being a perfectly proper garden some day.

As she neared the low, rambling house, fear overtook her; she could think of nothing to say, and was about to turn back when a vision of Susie and Susie's bobbing curls rose up before her. Susie McAllister see that house first! Not while Peggy Lou had breath left in her body!

Once in the hall she paused, then the sound of a whistling and of the prying open of a wooden box turned her footsteps towards the second room. She made no noise and stood for some time watching Dr. Gordon. He had a rose-colored lamp shade in his hand and was holding it up to the window so that the rays of the setting sun shining through it sent a warm glow into the unfurnished room.

Peggy Lou watched him lovingly, then "Hello!" she said suddenly.

Dr. Gordon turned, recognizing the sound of her voice, incredulity on his face; his mouth opened but no words came.

Peggy Lou gave a delightful little giggle.

"Aren't you glad to see me?" she said demurely. She had read that in a book and she thought it sounded well, gave one the mastery, as it were; but when Philip Gordon started toward her, a great light breaking over his face, terror seized her; she wanted to run.

"You said I was too lazy to live and I am not. I've knit for the Serbians, made clothes for the Belgians and—and Susie McAllister said you were going to show her the house! I just wouldn't let her see it first—"

But Philp Gordon's arms were around her by this time and Peggy Lou's remarks, her laughter and her half sobs, were lost in his embrace.

"Oh, Peggy Lou, darling," he said as he held her tighter, "then you did learn to walk for my sake?"

An hour later, with rose-colored lamp shades, and hangings with roses in the pattern scattered about them, they still sat on the same packing box talking things over.

"I think this chintz will look best in the dining room," Peggy Lou's voice could be heard. "Oh, Philip, my dear, when I think of the years I have wasted! If it hadn't been for you, I never should have learned to walk," and she sat up closer to him.

"Never mind, darling," Philip Gordon comforted in just those ways in which a girl loves to be comforted, "we can work together. I have the most wonderful plans and you must help me. Those poor children in Louisville—I think of them so often. My plan is this—to get the ground next here, put up some sore of barracks and bring these city youngsters down here in the summer."

"What's that tall box?" Peggy Lou demanded irrelevantly, not without first, however, giving Philip's arm a squeeze to assure him of her help and sympathy in his philanthropy.

"It's a victrola and in the other box are records. Peggy Lou, let's have a dance this minute, a house warming." Philip laughed boyishly as he attacked the casing around the victrola.

The six o'clock whistle blew but they did not hear it, nor were they conscious of the fact that John Charles and Mary Cleveland, having met down town and taking the longest way home past the old Johnson place, were standing spellbound beside John Charles roadster.

"You had better wait here for me, Mary," John Charles cautioned as he quietly started up the walk.

But Mary Cleveland would not wait. If John Charles was to be murdered by auto bandits, she wanted to be murdered too. As they tiptoed up the steps the sound of a victrola rather dissipated the burglar theory. A girl's laugh came to them through the open window. Mary Cleveland gasped.

"It's Peggy Lou," she whispered.

"Nonsense!" John Charles whispered back. "How could Peggy Lou—"

The victrola had stopped and Mary and John Charles looking in the window saw a strange sight. They saw a flushed Peggy Lou fall happily on a large packing box; they saw Dr. Philip Gordon sit beside her and slip his arm around her; and they saw Peggy Lou fit herself into the hollow of that arm as if this were the twentieth time she had done it instead of the second. John Charles was about to speak when Peggy Lou's voice floated out to them.

"I am so glad that you love me, Philip dear, because I love you, that's first, of course; but John Charles loves Mary Cleveland; he loves her very much, but he won't ask her to marry him—he feels that he shouldn't leave me. And Mary Cleveland loves John Charles. I know because she told me so. And now," she added shyly, "we can have a double wedding, can't we?"

The eavesdroppers started guiltily. Then as Mary Cleveland attempted to slip her hand from John Charles', she felt his grasp tighten. Together they tiptoed down the steps again, and by common consent, sat down on the lowest one.

"Is that true, Mary Cleveland, what Peggy Lou has just said?" John Charles asked in a trembling tone.

Mary Cleveland turned her face away from John Charles but that availed her nothing, for John Charles quietly got up, stepped behind her and sat down on her other side.

"It is useless for you to turn from me, Mary," he said gravely, "for each time you do, I shall cange my position and—"

Mary Cleveland buried her face in her hands, then she suddenly looked

COOKERY COLUMN

COCOA BISCUIT

2 cups flour
4 teaspoons baking powder
½ teaspoon salt
2 tablespoons sugar
4 tablespoons Cowan Cocoa
3 tablespoons butter
2/3 cup milk

1. Mix and sift dry ingredients.
2. Rub in the butter with the tips of the fingers.
3. Add milk gradually, mixing to a soft dough.
4. Toss on floured board.
5. Roll lightly to one-half inch in thickness, cut into small biscuits.
6. Bake in a hot oven 12 to 15 minutes.

up and smiled at John Charles.

"Oh, John Charles," she said with a catch in her voice, "you are the quaintest, the funniest, but the very dearest boy in all this world!".

* * *

And whether it was the wind or whether it was not, a sigh of contentment passed gently over the old Johnson house; a happy sigh of thankfulnesss that the lonely, empty days of these many years were to g've way to days of young life and laughter. Of merry voices in the rooms and soft laughter on the stairways; of evenings rid forever of their uncanny darkness by steady light shining out through rose-colored lamp shades. The old house would no longer be lonely. And the poor, tired ghosts of generations of Johnsons, their vigil over, silently folded their long, white clinging garments about them and prepared to find rest for their weary souls.

LIGHER IRONING DAY

In many households where one woman has everything to do, ironing day is looked upon with dread. Yet half the drudgery of ironing day is banished by the practice of intelligent methods and use of proper conveniences.

The irons should be perfectly clean and free from ashes and soot. Soap wrappers and coarse salt are good to rub them off. They must be hot to do good work. The gasoline iron has come into great favor as a time, labor and back saver, and it is always clean.

The height of the board should be regulated to suit the convenience of the ironer. Good adjustable boards can be found in almost any market and are not expensive.

In the summer, when there are heavy dews, cloths left over night on the line and taken off before the sun is up are in fine condition for ironing. At other times sprinkle overnight. In sprinkling use warm water it insures a more even dampness and leaves the clothes stiffer when ironed.

Table linen, pique dresses and all heavy fabrics should be very wet and ironed thoroughly dry with a very hot iron. The woolens should be only slightly dampened and the iron moderately hot. Too much ironing will yellow thing garments. When a garment is yellowed put it in the sunlight.

The secret of good ironing is ironing till the fabric is dry. No matter how smooothly the clothe are ironed, they will wrinkle when put in trunk or closet unless they are dry when taken from the board.

Thin pieces dry out quickly and it often happens that the garment is dry before th iron has been all over the surface. In such cases wring a clean cloth form the bowl of water and dampen ahead of the iron.

HANKING CURTAINS ON BRASS RODS

I haev been greatly annoyed for years when putting my lace and muslin curtains on the rods after laundering, to have the rods continually cathing in the lace, sometimes tearing it. Having discovered a method of overcoming the difficulty, I pass it on to others. When putting up long or sash curtains draw a small-sized rubber nipple over the end of the rod, and it will slip through the curtain so easily that you could put on six quicker than the usual way of forcing one through.

When Home Seems Good

A BLIZZARD OUTDOORS—warmth and comfort within. There is nothing in the home so necessary as a good furnace. Stoves and base burners are unequal to the task—they choke the air with dust and only warm parts of the house.

And buying a furnace is a matter of knowing how. The warm air heating system is the least costly. It is the most effective and healthful too. The

ENTERPRISE BLAZER WARM AIR FURNACE

will keep every corner of your home delightfully comfortable in all kinds of weather. It draws in the pure fresh air from the big outdoors, warms and moistens it and sends it on its way to you. Stoves and radiators can only heat the same air over and over.

Every part of the Enterprise Blazer Furnace is made just a little bit better than is necessary—the grate bars a little stronger—the fire-pot a little heavier. These are the things that enable us to guarantee that the Blazer Furnace will give you entire satisfaction.

Go fully into the matter with your dealer and write us for our free booklet "Warmth and Comfort"

Heart Pains So Bad

SAT UP MANY NIGHTS.

A large majority of the people are troubled more or less, with some form of heart trouble, and that distressed feeling that comes to those whose heart is in a weakened condition causes great anxiety and alarm.

On the first sign of any weakness of the heart Milburn's Heart and Nerve Pills should be taken, and thus secure prompt and permanent relief.

Mrs. Thomas Hopkins, Crowell, N.S., writes:—"I had heart trouble for several years, sometimes better and sometimes worse, but a year ago last fall I could not lie down in bed for that distressed feeling, and had to get up and sit up a great many nights, and when I did lie down it was with my head very high. I purchased two boxes of Milburn's Heart and Nerve Pills and feel a lot better. I can now lie down quite comfortably and the pains have gone too."

Milburn's Heart and Nerve Pills are 50c. a box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

CARE OF THE HAIR AND HANDS

Really beautiful hair—and its beauty may be of color or texture—possesses a witchery all its own, is quite capable of redeeming many a plain face and even deluding us into the belief that it has a certain attraction. The condition of the hair is largely a matter of physical health, yet certain characteristics are the result of fastidious care and cultivation. No uncared for hair can be beautiful and in nothing is personal neglect more plainly manifested. Unkept "tousely" hair, powdered with dandruff is, indeed, a repulsive sight.

A brush should never be touched to the hair other than with a gentle, caressnig motion; its first duty is that of a polisher to spread the natural oil exuding from the scalp over the hair and give it a satiny gloss; and, secoindarily, as a cleaner to wipe off the surface soil. Coincident with the rage for over-brushing there has been a mania for over-shampooing. But one has been as fatal to fine heads of hair as the other; and to both have, as over-irritants, much to answer for.

In cases where there is a tendency to baldness and great loss of hair, shampooing should be omitted except when cleanliness absolutely demands it, for you deprive it of its natural oil and fairly wash the life away.

There is no better shampoo for the hair than an egg well beaten with about an ounce of water, and rubbed thoroughly into the scalp. It is not only a detergent, cleansing the scalp and hair of dirt, but is tonic in its effect and strengthens the tissue of the scalp. It should be thoroughly massaged into the scalp with a rotary motion. It should not be á harsh motion nor pull the hair in the least. The palmer surface of the nail phalanges of the fingers must press the scalp firmly but gently so that you will feel it move under them. This massag restores elasticity to the scalp, and stimulates both it and the hair follicles remarkably.

The hair must be thoroughly rinsed, first in warm water, then—if preferred—in cold, to secure reaction. Wipe the hair as dry as possible in warm towels. In warm weather it is a simple operation to finish the task in the open air and sunlight, but in winter it is often necessary to hold the head in a current of warm air and to fan it to facilitate drying.

Finish the operation with a dry massage, and when every particle of moisture has evaporated, if the tendency of the scalp is to dryness, rub in a little olive oil or vaseline.

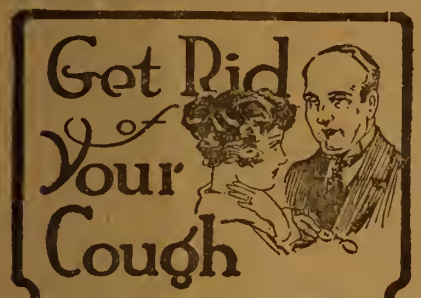
Not all the tender care in the world, upon the skin of the hand will make it attractive unless the nails receive special attention and training. The condition of the nails in their shape and color and sheen is the crowning attraction of a beautiful hand, and if they show the slightest neglect, we are apt to judge of a stranger's culture and refinement by these indisputable evidences of personal care and fastidiousness. The dainty woman cannot take too good care of her nails as thew either beautify or disfigure the fingers and an attractive hand is imyossible without pretty nails. They improve rapidly with culture. Every woman with average common sense and adaptabliity can train herself to do her own manicuring and she does not need an elaborately fitted manicure case for the task either.

As a preparation for manicuring the nails the fingers should be held for a few minutes in a bowl of warm, soapy water. This softens the nails so they can be filed without breaking. They should be kept just the length of the fingers and trimmed in a graceful curve. After trimming the nails, and while they are still soft from the action of the warm water, push the scarf skin down closely about the roots with an orange-wood stick. If the scarf skin has grown up on the nail, do not trim it off as some direct for thereby trouble begins. It will take time and patience to correct the neglect, but a few weeks' attention will accomplish wonders. Push the skin back gently and carefully.

If tinted cosmetic powder is used on the nails, it must be with great discretion, for a deep tint, giving an artificial appearance, is vulgar. A little polshing powder may be used once or twice a week, and a light rubbing with the chamois polisher every day gives the finishing touch to the manicuring.

Chapped hands are usually the result of neglect or carlessness and their relief will require twice the care and attention, which bestowed daily would have precented the discomfort and pain. An application of a good hand lotion each night will keep the hands soft and will tend to whiten them.

The astringent lotions and emolient pastes which refine the skin of the hands will perform the same service for the arms. But nothing else has so much influence in giving the flesh firmness and elasticity and exquiste curves, and to the skin every quality of beauty as the daily cleansing bath.



Ordinary Remedies won't reach a deep-seated cough or chronic Bronchitis. What you should take is a strength-and-body-builder like OLIVEINE EMULSION, to make good, red blood, firm flesh and increased vitality, so that your system will have the power to throw off the cold.

OLIVEINE EMULSION

The Great Health Restorer

will help you just as it helped this lady in DeSables.

"I cannot recommend your excellent medicine highly enough: It has done me so much good. I had a cold; was weak and run-down; but OLIVEINE EMULSION has completely relieved me and I feel better than ever."

KATIE McDONALD.

Druggists and General Stores have this reliable tonic, blood purifier and body builder. Insist on having the genuine OLIVEINE EMULSION.

COMFORTABLE BEDS FOR THE FAMILY

Since the night's rest or unrest has everything in the world to do with the quality of the day's work, comfortable beds for all the family should be the care of every good housewife. Sagged springs and lumpy mattresses are the worst foes to bed comfort; it doesn't pay to tolerate them. A claw hamemr or a wrench may be all that is necessary to tighten up that slacked wire which plays havoc with the comfort qualities of your bedsprings. The best thing for a lumpy mattress is to send it directly to the renovator or to the junk man. If, however, it be but slightly uneven, a folded blanket placed upon the springs under the depression will correct the unevenness. Good, well-made mattresses are cheapest in the long run. The comfort features of the shoddy article are shortlived. Having invested in the good article, the next thing is to use it well. Turn it frequently, end for end, and if wool padded on both sides, turn over as well. Don't shake it. Shaking it tears the ticking and disarranges the padding. Puff up the mattress by gentle blows or bringing the ends together.

It is a good plan to cover the springs with an old quilt or blanket, that in damp weather they may not rust the mattress. Always use a substantial protector on top of the mattress, something that can be tubbed without too much trouble, yet thick enough to afford satisfactory protection. The quilted ones are highly serviceable in that respect.

Remembering that your motto is "bed comfort," do not have your pillows extremely large or stuffed too full. Even goosedown pillows can be made uncomfortablly hard by crowding too many feathers into the ticks. The immense pillow may give the bed a luxurious appearance, but the small pillow hich does not unnaturally bolster the neck and shoulders is more comfortable. It is well to enclose the pillow tick proper in a second tick made easily removable for laundering—this in addition to the outside muslin slip—because of the difficulty of washing feathers. The muslin slip does not afford sufficient protection to the tick, which will in time become soiled.

The thoroughly comfortable bed is the well-aired bed. However carefully ventilated the sleeping room at night, beds should not be made up in the morning without first being conscientiously aired, frequently sunned, Open wide all the windows, spread the bedclothes on chairs in such manner that each piece will be exposed to fresh aid; turn back the protector from the mattress. The sleepin-porch and the sun-parlor are ideal for such purposes. Where they are lacking, frequently hang the bedclothes on a line out of doors where they will get the bright sunlight. Sunshine is a wonderful deodorizer. Mattresses especially need to be often sunned. This practice will be more easily carried out if the two-piece kind is used. The mattress in one piece is awkward to lift, and for that very reason generally does not receive the airing it should have. Always select a dry day for putting the mattress out, and never make up the bed with damp mattress or coverings. Not only does careful attention to this detail make for bed comfort, but neglect of it invites serious physical ills.

Cleanliness throughout is one of the first necessities to the comfortable bed. Soiled pillow slips, dirty bed-clothes, dingy spreads, spoil the attractivesness of any bed, and consequently detract from comfort. The dainty bed invites to a night's repose.

Teh doctors tell us that, if we are to have healthy bodies, we must sleep eight hours out of twenty-four. Some few favored individuals may be able to spend more time than that in bed, but most of us gnd it difficult enough to allow ourselves the stipulated eight hours. Therefore, we cannot afford to waste any part of the precious moments in sdeepless unrest because of uncomfortable beds.

Let the asesrtion be repeated: It is the duty of every good housewife to see that all the beds in the house be made just as comfortable and as sanitary as circumstances will permit.

Rheumatism Stiffness and all Pain

Minard's Liniment has given satisfaction for three generations. It quickly relieves sore throat, bronchitis, neuralgia, sciatica and any kind of pain.

An Old Reliable Remedy

Mrs. S. Fawcett, Hamilton St., Collingwood, Ont., writes,—Minard's Liniment surely is an old reliable remedy. I always keep a bottle in the house and have recommended it to quite a number of my friends, to whom it gave great relief. In most cases it was used as a cure for rheumatism.

Minard's King of Pain Liniment

Yarmouth Nova Scotia.

LAYING LINOLEUM WITH CEMENT

In the choice of a kitchen floor, several possibilities offer. Without a doubt, the most practical floor, at the price, for the average kitchen, is a good inlaid linoleum. Such a floor, if an attractive design is chosen—one in which white or light colors predominate—is extremely good-looking, and, if properly laid, is sanitary, easily cleaned, and most durable. In addition, it is sound proof, and comfortable to stand on. The laying is important. To give the best results, linoleum should be accurately measured and carefully cut and laid by an expert. When cutting or piercing is necessary it is wise to have the edges cemented, so that no water may get under the surface when washing or wiping it up. An ideal way is to coat not merely the edges and seams, but the entire back with waterproof cement. The manufacturers of high grade linoleum recommend and supply a cement for this purpose. A narrow molding which covers the edge of the linoleum where it meets the wall is an added protection. This is advisable whether the cement is used or not. If linoleum is lightly shellaced occasionally, or rubbed with a good polish or floor wax, it will last longer and the bright colors may be indefinitely preserved.

NOTES FROM THE NOVA SCOTIA AGRICULTURAL COLLEGE

(Continued from page 530)

question of financing and making plans for future development have been submitted to the Agricultural Departments of the three provinces. To date no move has been taken and the question is now as far as I am concerned in the Government's hands and in the hands of the Board of Directors, and I trust will be given your consideration.

In the meantime, while I am convinced that something has been accomplished in our present accommodations, I feel that it would be unfair to the Dairy interests of these provinces to continue under such conditions and I will therefore recommend that no further courses be attempted until such time as suitable quarters can be established, moderntly equipped in such a way as to make it practical to put on such courses as the importance of the business demands.

Respectfully submitted,
W. A. MacKAY, Supt.

Two important promotions have recently taken place within the Experimental Farms System. Mr. George B. Rothwell, who has been Acting Chief of the Animal Husbandry Division since the spring of 1919, has been promoted to the position of Dominion Animal Husbandman. Mr. Rothwell has been a member of the staff of the Experimental Farm since 1912, when he was appointed Assistant Dominion Animal Husbandman. He is a graduate of the 1905 class of the Ontario Agricultural College.

Mr. N. D. MacKenzie has ben promoted from the position of Acting Superintendent of the Experimental Farm at Indian Head to the position of Superintendent. Mr. MacKenzie first entered the staff at the Indian Head Farm in 1917. He was later granted leave to finish his course at the Ontario Agricultural College from which he graduated in 1919.

GLEANINGS OF AGRICULTURAL PROGRESS IN N. B.

(Continued from page 531)

turns are not yet completed, it is thought that the Club's strength will number in the neighborhood of thirty-five during the initial year of its activity, and efforts will constantly be made to further add to the membership of the Carleton County Holstein Breeders' Club. Intending purchasers of Holsteins in, and outside of, Carleton County would be well advised to get in touch with the Club's Secretary, R. W. Maxwell, Woodstock, N. B., who will be pleased to help you decide in the matter of conetmplated purchases.

WHEN SHOULD THE FARMER BUY HIS TRACTOR?

(By Earl B. Stone, Asst. Adv. Manager of The Cleveland Tractor Co.)

Records sof retail tractor sales for more than five years past show that the farmers of America buy more tractors in April and September than at any other time in the year. And since these two months mark the opening of the busiest season of seed bed preparation, we are forced to conclude that our farmers wait until the very last minute before selecting their tractors.

But this is a practice which sooner or later will cost the majority of tractor owners a whole lot of trouble and delay and it has already brought riscredit upon more than one worthy tractor. If our farmers are to get full value from their tactor investments they cannot wait until the season is on befoe buying.

A tractor like any other piece of hauling machinery, whether it is mechanical or alive, must be worked in gradually to bring out its full efficiency. No farmer would think of driving his horses at a mid-season pace after months of inactivity in the barn. He knows their limitations and so works easily for only a few hours at first, gradually increasing the load and the hours as sinews harden and their wind improves. This method of building up horse flesh is such common knowledge to the farmer that he forgets or neglects to apply it to his tractor. But when the tractor gives way under the sudden strain of spring work, he refuses to consider himself in any fault.

Even the lesson learned from their first automobile experience fails to impress our farmers as applicable to tractors. The auto dealers wisely cautioned them to take it easy at first. Some heeded the caution and became enthusiastic over their first machines, while others "stepped on the gas" right from the start and they got nothing but trouble and expense in return.

How much this take-it-easy warning should be observed when starting a tractor is evident from the fact that a tractor motor does more than 20 times the work of an automobile engine in travelling the same distance. If it paid to give the automobile a thorough working in, it will pay ten times over to give your tractor the same care and attention.

No farmer will ever get all he is entitled to get fom his tractor if he buys it the day or the week before he starts to plow. The tractor will do its lvel best of course, perhaps it will go through one whole season without a hitch, but he has shortened its life and in the end he will pay dearly for his last-minute purchases.

The time to buy a tractor is a month or two before it will be needed for the hard job of breaking ground and fitting the seed bed. The farmers who are going to purchase this spring will save money by making their purchase now. A month or omre of easy work will get the new tractor "fit" for the strenous day when it must sometimes work 24 hours without a stop.

There is no end of odd jobs which the tractor can do before spring work opens up and each day it is used will help to make it more dependable when the heavy work comes along.

Most wood lots have some fallen timber which should be snaked to the barn yard and sawed. The tractor will do both jobs and welcome the chance to limber up its gears. Or there is corn to shred, feed to grind, manure to haul, roads to clear of snow and ditches to run.

These odd jobs do two things which insure the successful operation of the tractor in the future. First of all they acquaint the owner with his tractor as nothing but actual use can do. They give him the "feel" of his machine and develop an "ear" for its song of satisfaction or cry of pain. Secondly, they give the bearings a chance to work and help the valves to seat more snugly. They fit piston rings to cylinder walls more perfectly than the most exact machine can do it and they limber up every gear and pinion much as the first days of easy work take the kinks out of a horse's back and legs.

Once worked in and properly maintained, the tractor is as far ahead of the horse as the Twentieth Century Limited is ahead of the olden stage coach. But it cannot do its best without a chance to limber up. When the farmer buys his tractor a month or more ahead of the busy season and works up to his peak load gradually, he will get the maximum return from his investment. He cannot expect it in any other way.

N. B. BEE KEEPERS HOLD ANNUAL MEETING

The seventh annual meeting of the New Brunswick Beekeepers' Association took place on the 17th in the Provincial Normal School building, President George H. Pugh, of Nashwaaksis, in the chair. The usual routine business was transacted, officers were elected for the ensuing year and L. T. Floyd, Provincial Apiarist, presented a very interesting report of the year's work.

Officers were elected as follows:

President—George H. Pugh, Nashwaaksis.

1st Vice President—Ludlow Hoyt, Prince William.

pnd Vice President—T. H. Manzer, Aroostook Junction.

Sec.-Treas.—L. T. Floyd, Fredericton.

County Directors—Albert, Cecil W. Steeves, Forest Hill; Carleton, Harry G. Miller, Tracy Mills; Charlotte, A. T. Reed, Rolling Dam; Gloucester, Maynard Smith, West Bathurst; Kent, J. B. Vautour, St. Louis; Kings, Franklyn Y. Wetmore, Clifton; Madawaska, William J. Moran, Edmundston; Northumberland, W. H. Davidson, Newcastle; Queens, W. T. Inch, Hampstead; Restigouche, Rev. J. H. McLean, Dalhousie; St. John, Harry Armstrong, 40 Summer street, St. John; Sunbury, J. B. Young, Oromocti; Victoria, A. L. Green, Plaster Rock; York, David Hiscoe, Fredericton; Westmorland, Prof. W. G. Watson, Sackville.

Mr. Floyd, Provincial Apiarist and secretary of the Association, reported

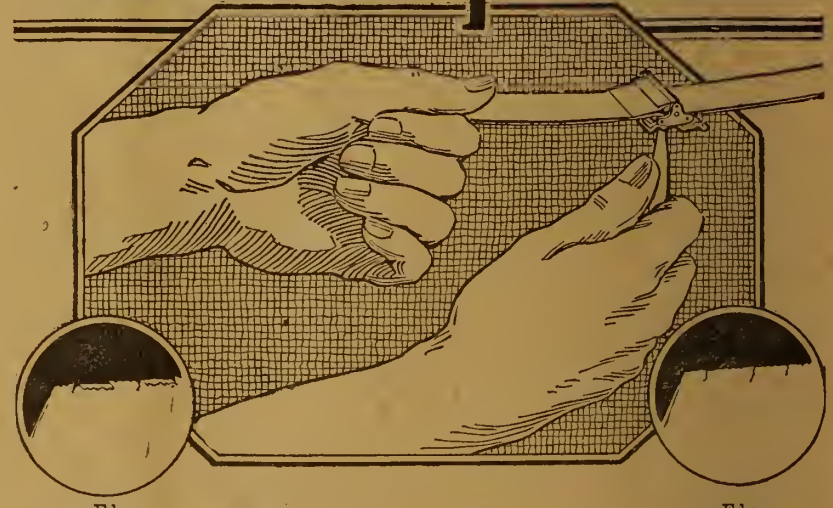
AutoStrop Razor



Edge Before Stropping (Magnified)

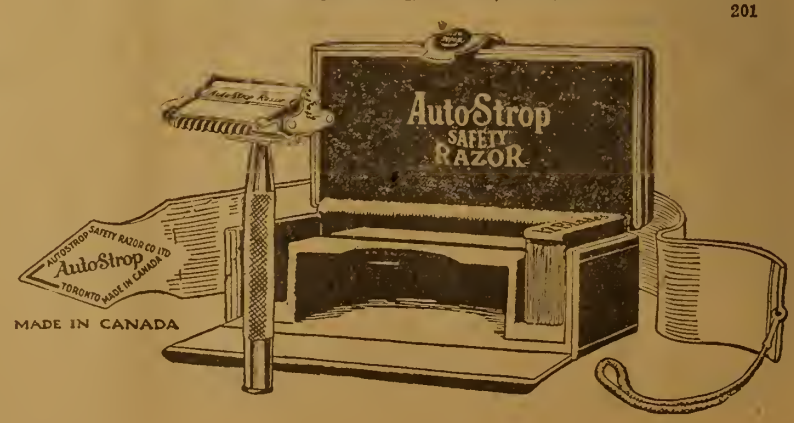
Edge After Stropping (Magnified)

IT'S the stropping that counts! Any razor is soon ruined by unskilled stropping. There is one and one only razor that sharpens itself—the AutoStrop Razor. You can't strop it wrongly—just slip the strop through the frame and a few strokes to and fro will renew the blade edge.

Any dealer will demonstrate the AutoStrop Razor to you, guarantee satisfaction, or refund of purchase price. Only $5.00—complete with strop and twelve blades in an attractive assortment of cases to suit any purpose.

AutoStrop Safety Razor Co., Limited
AutoStrop Building, Toronto, Canada

201



that during 1919 the honey crop in New Brunswick had more than doubled and that there was every evidence that bee-keeping was one of the most profitable sidelines of farming. Dealing with marketing he pointed out that hiney must be well graded to compete with honey from other sections. He urged that the best of style package must be used and that in order to build up a market a difference must be maintained between retail and wholesale prices. Mr. Floyd announced that in the whole province the number of hives had greatly increased. In the North Shore counties little attention had been given to beekeeping but a number of people in that district had made a beginning. Efforts to establish beekeeping there would be continued. During the year the Association had handled supplies to the amount of $1,452. This had been with a saving to members of 10 per cent. on supplies and 25 per cent. on containers.

PREPARING FOR THE BREEDING SEASON

(Experimental Farms Note)

By this time it should be fairly well decided what birds are to be used in the breeding pens.

In the main, dependence should be placed on hens, but it is always well to use some of the best pullets, as by so doing a year's time is very often saved.

As none but the best pullets should have been carried over the second season, there should be very little culling of the hens required. However, there are always a few that have not kept in prime breeding condition, some may have put on too much fat—others may have shown a tendency to colds or other undesirable qualities. These should not be put into the breeding pens.

The hens intended for breeders should be carried through the winter in a normal condition, without forcing or stimulation of any kind, so that they come to the breeding season full of vim and vigour. To obtain and retain this condition, green feed should be plentifully supplied. Chopped clover, sprouted oats or mangels are all good.

The pullets used should be early hatched, vigorous and well matured.

To these selected females should be mated either vigorous cock birds that have already been proven as breeders or strong, vigorous, well-matured cockerels that are not only the sons of high-producing hens, but the brothers of pullets that have shown by their performance that they carry the quality for high production.

Do not make the matings too large. A good, vigorous cockerel of the general purpose type on free range may successfully look after 15 or 20 or even more females, but the same bird in confinement might "fall down" lamentably with more than half that number. Do not expect a cock to attend to the number of females that a cockeerl would, and if you are looking for early chickens, use cockerels at the head of the breeding pens, as they are much more reliable early in the season.—George Robertson, Assistant Dominion Poultry Husbandman.

ROTTED MANURE BEST GARDEN FERTILIZER

Vegetables are gross feeders and require a large amount of plant food to give maximum results. Well rotted manure is the ideal garden fertilizer.

In small gardens, particularly where the soil is light, if manured and dug over in the autumn, a second digging in the spring will be advisable only of such portions as are to be devoted to such crops as cabbage, tomatoes, egg-plant, lettuce. A stirring of the surface will be sufficient where beets, carrots, etc., are to be grown, and this should not take place until the time for planting and sowing arrives, as freshly worked soil is best for both operations. It is important that soil should not be worked in too wet a condition, otherwise it will dry in lumps, and much time and labor will be necessary to repair the damage.

The secret of success with early planting of such crops as peas, beets, beans, is to sow the seed at only half the depth of later sowings. This is particularly the case on heavy soils. Seeding on light soil should always be at a slightly greater depth than on heavy soil. Remember that in dry weather cultivation should be continuous. When watering is necessary, it should be applied to the roots and not sprayed or springled over the surface. A trench may be opened up with a hand or wheel hoe along each row, water poured in from a pail, and the earth thrown back. In this way two hundred feet of row may be thoroughly watered by two persons in half on hour, and cultivating and watering are performed in one operation.

Good wood-ashes form an excellent general fertilizer for the garden. They should be applied in the spring when the land is not too wet. Sifted coal ashes will be of great benefit on heavy soil. They improve the texture of the soil and help set free food for the plants.

Soils that have been under cultivation for some time need lime. Crops will not grow well if the soil is acid, and lime correct acidity and liberates plant food. It should be applied broadcast early in the spring, at the rate of say, one pound to ten square feet.

Have a garden, if possible, not only for the fresh wholesome food that can be priduced, but also fod the pleasure of it. Plant a few flower seeds and watch them grow.

Precious Hours and Dear Labor Saved With

LOUDEN

HAY TOOLS

HAYING is one of the heaviest jobs on the farm. Are you going to have the necessary labor to harvest the crop? Added to the labor scarcity is the uncertainty of the weather.

Hay which is cured and ready to haul into the barn loses much of its feeding value if it becomes wet.

Works Like A Giant

With a Louden Haying Outfit to work like a giant for you, you are not only enabled to reduce the labor of harvesting your crop, but you are relieved of much of the anxiety of being caught by catchy haying weather. It will enable you to get through your haying in one-half the usual time—with one-half the help—and with fewer horses.

Five to Seven Minutes

A Louden Sling Carrier Outfit will handle your biggest loads in from five to seven minutes. Lifting the load straight up from the wagon it is deposited well-spread and cross-wise of the mow, which makes mowing back easy. It does not matter how high your barn is, it can be filled to the peak with a Louden Outfit.

A Louden Outfit not only means less work for you, but may mean the saving of enough more good well-cured hay to pay for the whole outfit in one year.

Bound Grain Also Handled

Hay, Bound Grain, Straw or any other forage can be handled quickly and equally well. An all-year-round equipment is what you get when you use a Louden Sling Carrier Equipment.

If your barn is unsuited for a sling carrier equipment the next best thing is the Louden Senior Fork Carrier and Giant Grapple Fork. We are the Pioneers in the manufacture of Haying Tools and years of specialization well fits us to take care of your needs.

A man on the load—one in the mow or on the stack—and a boy at the hoist. That's all the help you need to run a Louden Sling or Hay Fork, a Louden Hay Carrier and a Louden Hoist.

INCUBATION AND BROODING OF CHICKS

(Continued from page 547)

at a time and often during the first two weeks. Dry breadcrumbs slightly moistened with milk, rolled oats, pinhead oatmeal and finely cracked mixed grains may be allowed, but all changes should be made gradually. Give them plenty of green food and place grit, water or sour milk where the chicks will have free access to it. Self feeding hopper containing cracked grains and dry mash are the best means of feeding the growing stock while on a good grass range.

J. D. LANG, Poultryman,
Lennoxville Experimental Farm.

BROODING AND FEEDING OF CHICKS

(Experimental Farms Note)

Brooding methods have undergone considerable changes of late. For small flocks the portable hover is undoubtedly the most satisfactory, but even with comparatively small flocks some are now using stove brooders. The advantage of these stoves is that they can brood large flocks at a comparatively small cost. The pipe brooder was the system that was formerly used on large plants and is still quite largely employed. It gives excellent satisfaction but is so expensive to install that the stove brooders are largely supplanting it.

These stove brooders can be used in any ordinary colony housé, thus avoiding the necessity of a special brooder house. They are made in different sizes and will accommodate either large or small flocks. Five hundred chicks can be attended in a colony house with almost as little labour as 50 in a small brooder, and the additional cost is comparatively low.

When the chicks are removed from the incubator, care should be taken to avoid chilling them. The brooder should be so heated that they will be able to get a temperature of 100 degrees.

If the hovers are heated to 90 or 95 degrees before the chicks are put in them, the heat generated by the chicks will bring it up to the desired temperature. The idea is to give the chicks as low a temperature as is consistant with their comfort. The temperature should be gradually reduced but never so quickly as to cause any discomfort to the chicks.

With the brooder stoves the chicks can select their own temperatures. If they want a little more heat they can get a little closer to the stove, if they get too warm they can spread out a little more. It is advisable when the chicks are first put into the house to make a ring around the stove in which the chicks are confined until they become used to their new quarters and get accustomed to the source of heat, then the fence may be removed. For this purpose a strip of ready-roofing—half width—answers to perfection, as it is easily handled and it breaks the draughts, which are liable to be along the floor and which are one of the dangers that should be guarded against in this method of brooding.

Feeding:—When the chick is hatched it comes into the world with a sufficient supply of nourishment in the form of egg yolk to last it for several days. What a chick requires at the start is not feed but warmth and rest. When the chicks show positive signs of hunger, which will be in about two or three days, give them a feed scattered on a little coarse sand or chick grit. For this first feed, hard boiled egg and bread crumbs in the proportion of about four of bread crumbs to one of egg is used. Feed little and often, alternating this feed with scratch grains and dry mash. Supply tender green feed such as lettuce or something similar. After the first week hoppers of dry mash should be kept before them, and by the time they are about ten days old, the egg feed may be discontinued. Place grit, water and a dish of sour milk where they will have free access to them. Nothing provides animal food in better form than does sour milk.

Bethel Block, A. G. Dunphy's Orchard Green Apple Bug Control

Firt spray applied when the leaf buds were opening, May 19th, material 3-10-40 Bordeaux and one pound arsenate of lime. Second spray applied just before the blossoms opened. May 27th.; material soluble sulphur one pound, nicotine sulphate 2/5 pint, to 40 gallons of water. Third spray applied just after the blossoms fall, June 11th.; material, used soluble sulphur one pound, nicotine sulphate 2/5 pint, to 40 gallons of water. Fourth spray 3-10-40 Bordeaux, one pound of arsenate of lime, applied ten days after the third spray, June 21st and 22nd.

Total apples counted.....2758
Total apples affected with Green Apple Bug.....5.8%
Total apples un-affected with Green Apple Bug.....94.2%
Total apples affected with side worm 2.8%

In 1917 Mr. Dunphy's crop of Bethels amounted to five barrels of marketable apples. In 1918 the crop was 12 barrels of marketable fruit. This year, 1919, Mr. Dunphy picked over one hundred barrels of excellent Bethel apples.

The most essential thing in Green Apple Bug Control after getting the solutions right, is the pressure or force with which the spray is driven at the tree. Drenching at high pressure is essential to success, as the insect is usually hiding in crevices of the bud where no ordinary spray will touch it.

Dusting

You have undoubtedly heard of the progress that dusting is making in Nova Scotia. We had Mr. William Fox try the dust in a small way for us last year with rather unsatisfactory results. We are going to keep on testing the dust here in this Province in full expectation of developing a dust spray which will prove of value. On account of the large number of McIntosh that you grow, and on account of your climate being a particularly bad one for fungus diseases, I would recommend that you continue spraying for the present. If you ever want to change to dusters you can use the same engine as you are now using for spraying, and buy only a blower, which is not a very expensive apparatus.

Address by Geo. E. Sanders, Entomologist in charge Insecticide Investigators, Entomological Branch, Ottawa, Ont., at the recent N. B. Fruit Growers' Association.

AUTUMN VERSUS SPRING PLOWING

(Experimental Farms Note)

There are so many different soils to plough and so many kinds of ploughs to plough them with that no definite rule can be laid down as the best method for all soils.

We plough to bury vegetation and manure, so that they may decay and feed the future plants. We plough to pulverize the soil and fit it to receive the seed. No other implement will do so much in one operation toward the making of an ideal seed bed, as a good plough in skilled hands. We plough to increase the water holding capacity of the soil. We plough to destroy weeds, insects and rodents.

Why Should We Plough in the Autumn

Because this comparatively slow operation may be performed more economically when horse and man power are not at such a premium as they are during the rush of spring seeding. Early autumn ploughing enables the heat from the September sun to hasten the decomposition of one season's refuse plant growth so that it may feed the succeeding one. Late autumn ridging with a plough greatly benefits many soils by exposing the greatest possible surface to the action of freezing and thawing, nature's most wonderful pulverizer, which has made most of the seed beds throughout the ages, and is today our greatest agent in producing the tilth so

necessary for large crops. In the autumn a dry soil may be ploughed without causing the same injury that would follow ploughing a soil in that condition in the spring. It is also possible to plough land so wet in the late autumn that there is a gloss or sheen from the mould-board, knowing that the frost of winnter will turn what would make clods at other seasons, into mellow seeds beds in the spring.

Soils That Should Be Left and not Ploughed Until Spring

Light coils that blow, and soils on steep hill sides that wash, should not be evposed to the gales and heavy rains of winter and early spring. Some heavy clay soils that puddle during the heavy spring rains are better left and ploughed when they have reached the right degree of friability to crumble under the mould-board.

Land that Barely Needs the Plough to Prepare It

Land tht hs produced a hoed crop such as potaoes, turnips, mangels or vegetables, usually produces a better crop if the seed bed is formed for the following grain crop without the use of the plough. Ribbing in late autumn has been the only use of the plough that has increased such crops at Charlottetown.

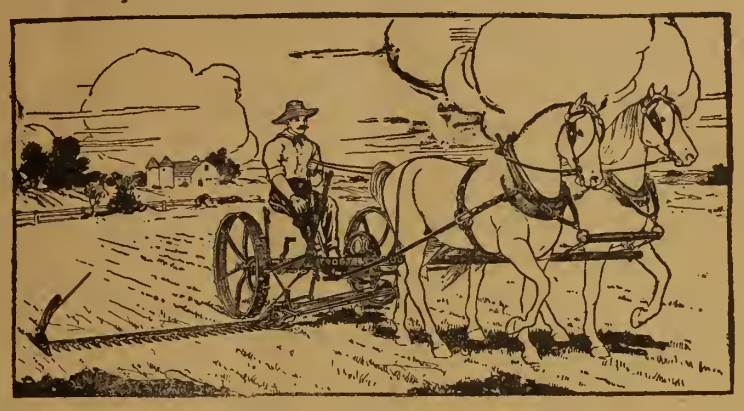
Experimental Data

A few results from the cultural experiments at Charlottetown, that bear directly on this problem, are of interest. The figures secured are from average yields covering four seasons form fields of oats on a comparatively level, sandy loam soil. Sod ploughed in August gave 47 bushels and 14 lbs.; sod ploughed in November (no other autumn work), 42 bushels and 32 lbs.; sod ploughed in spring, 34 bushels and 9 lbs. Loss from spring ploughing compared with August plowing, 13 busels and 5 lbs.; compared with November ploughing, 8 bushels and 23 lbs. There were 45 pltos in this particular five-year rotation, and the spring ploughing of sod averaged 6 bushels below the poorest autumn method of breaking sod. Therefore plough your sod in the autumn, and as much of your stubble as you can. Leave your land after a hoed crop without ploughing, except to rib it.—J. A. Clark, Supt. Experimental Sta., Charlottetown, P. E. I.

Frost & Wood

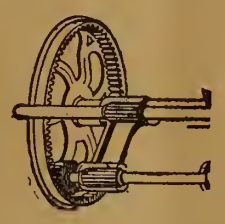
A money making machine for a money making crop.

With feedstuffs climbing in price you can't afford to take chances with your hay crop. Scrap that old mower and get real efficiency with a



Frost & Wood Mower

The longer you own one, the heavier the crop you put it at and the rougher and more hilly your land, the more enthusiastic you will become over the many splendid merits of the Frost and Wood Mower. Its high quality roller bearings ensure light draft. Its cutter bar strength and superior cutting mechanism guarantee long service, good service and service when you want it. All levers easy of control and handy to reach. Thousands of farmers have good reason to swear by the F. & W. Mower.



F. & W. "Internal Drive" gear means real efficiency

Look for this Frost and Wood feature. The pinion which takes the operating power from the big drive wheel, "runs on the inside." The two wheels turn in the same direction. No tendency to fly apart, become rattly and break cogs. Always ready for work and a quick start into a heavy crop doesn't bother this gear at all. The knives keep on cutting when bar is raised to clear obstructions, saving time—and crop.

We don't want you to judge the Frost and Wood Mower by this meagre description. Write us today for special Mower Pamphlet. See the Mower, and the rest of our big, complete line at our nearest Agents.

THE FROST & WOOD CO. LIMITED

TRURO CHARLOTTETOWN ST. JOHN

NOTES ON FERTILIZERS AND THEIR USE

(Continued from page 537)

The Alsatian muriate of potash is of excellent quality—quite equal to that from the Stassfurt mines. Alsace does not produce sulphate of potash. The sulphate has been preferred to the muriate for tre potato crop, but our experiments have shown no appreciable deterioration in quality from use of the muriate—and both forms have proved equally valuable and effective as to yields.

There is some potash on the market from other sources. That from the best sugar factory—a limited amount—has given excellent results—though if in the form of a liquid—the "mother liquor" is only applicable, or perhaps I should say usable, in mixed goods. The "ash" from the liquor is rich in potash compaund and is a product of excellent quality for fertilizing purposes.

The ash of tobacco waste from tobacco and cigar factories contains high, but variable percentages of potash. It is a valuable potassic fertilizer, and one well suited for tobacco and garden crops generally.

The potash as deposited by the Cottrell process from the fumes of cement works is another excellent source, now largely used on the Continent and is destined undoubtedly to find a place on our markets.

There is also some potash from American sources—from saline deposits and the waters of certain lakes in California, Nebraska and other western states. This is being used largely today in the United States. Certain of the brands have been found to have an injurious effect on crops owing to the presence of appreciable percentages of borax. This has necessitated a regulation on the part of the United States Federal authorities to the effect that the limit of safety is 2 pounds of borax to the ton of fertilizer. This is the maximum amount allowed unless without a definite labelling of the percentage present.

Though we could not advise the direct application of wood ashes for potatoes—as their alkalinity might favor the development of scab—there is no better potassic fertilizer than this natural source. If used for the preceding crop, say clover, as a top dressing—or if applied with superphosphate, we can see no objection to their employment as a source of potash by potato growers. There are assuredly large quantities of wood ashes produced annually in the Maritime provinces, and every care should be taken that they are not allowed to go to waste or to be leached of the valuable constituent through imperfect protection during storage.

As a word of comfort on this potash quejstion, it may be said that results during the past four years indicate that we have placed too much importance upon potash as a fertilizer. It is very doubtful if the very large applications made in pre-war time were profitable. It is seldom that there is any profitable return from potash dressings on clay loams. The case with sandy and mucky loams is different; potash on them especially for certain potash loving crops as for instance, potatoes, will usually give a good response. But speaking generally we may conclude that the cutting off of the potash supplies has not been the disastrous thing we thought it would be.

These fragmentary notes may be concluded with urging upon you two matters. The first is, make an effort to learn on your own land what your soil requires by direct experiment, and what is the limit of profitable fertilizing under your own conditions of soil and season. It would be well that every farmer should have a series of plots or strips so fertilized as to bring out the effect of the various fertilizers, but failing this he should at least leave an unfertilized strip in his field and note the yield therefrom as compared with that from an area of similar or equal size from the remainder of the fertilizer field.

The second point is, consider fertilizers as supplementary; don't depend upon them solely to feed your crop or to keep up the fertility of the soil. The humus content of the soil must be maintained, probably increased, if the best results are to be obtained with fertilizers. Barnyard manure contains considerable amounts of nitrogen, phosphoric acid and potash, but its value does not solely depend on these; its action on the tilth of the soil and of increasing its water-holding capacity is invaluable. Further, it is the source and mainstay of the microbic life of the soil—a matter of the highest importance. Our advice is, produce all the manure that the size of your farm and conditions of farming will permit, and get it into the soil or on to the soil as quickly as may be while it is still fresh. The clover sod has already been spoken of as furnishing both humus and nitrogen. Adopt a rotation which includes this most valuable crop and enricher of soils. Other sources of humus are the so-called green crops turned under—buckwheat, rye, rape, etc.; their addition to the soil constitutes one of the most economic means we have for soil improvement. Fertilizers have a legitimate place in soil management, especially in intensive farming, but for their most profitable employment the soil must be kept in good "heart"—and this can only be done—whether the soil be sand or clay—by constantly replenishing its store of humus by the means we have indicated.

CO-OPERATIVE ASSOCIATION'S RESPONSIBILITY

Co-operative Associations desiring to market fruit in open packages bearing the association brand, and without the name and address of the original packer, must in addition to the association's brand place on the package a number or other mark, which will designate the original packer of the fruit. This number or mark must receive the approval of the Minister of Agriculture.

BUY RED CLOVER SEED EARLY

Prime red clover seed was quoted at $35.55 per bushel on the Toledo market of the 6th instant. Toronto prices then ranged about $3.00 per bushel in advance of Toledo prices. Clover seed that would grade "Prime" on the Toledo market could be bought in Toronto at $38.50 and, because of exchange conditions, delivered to United States points at approximately $33.00 per bushel, or about $2.50 less than the Toledo price. The money situation, short supplies, and an earlier demand in the United States, will explain the heavy exports of clover seed.

The price of red clover seed has advanced almost $14.00 per bushel on the Toledo market since May last. The world supply will not be sufficient to meet normal requirements. In these circumstances, Canadian farmers who delay the purchase of their red clover seed requirements until seeding time may be unable to obtain supplies at any price.

THE BEATTY BARN BOOK

We have just received a copy of the new B.T. Barn Book, recently published for distribution to farmers and others who purpose building new barns or remodelling old barns and stables, by Beatty Bros., Fergus, Ontario.

The B.T. Barn Book is looked upon as a text book by Canadian farmers on the subject of planning, designing and equipping barns and other farm buildings. Neither time nor expense has been spared in accumulating the best information and illustrations. It is bound so as to form a permanent work of reference.

It matters not, reader, how good a plan you may have in your mind for your remodelling or building operations, it will pay you to get a copy of the B.T. Barn Book. From it you will glean ideas that will give you the last word in construction and convenience. The book is free for the asking, only tell the Beatty Bros. some idea of what you wish to build or remodel.

WATER SUPPLY SYSTEMS FOR FARM HOMES

Every farm home should have a water system which wfll furnish an ample cupply of good water for cooking and washing purposes. Carrying water for household purposes by the "water pail route" is hard, tiresome, labor.

Running water on the farm is not a luxury which may be had only by those who have means, but some type of water system is in the reach of all. In considering any water system, one should ask himself the following questions:

Is it simple and dependable?

Is it safe and sanitary?

Is it reasonably low in cost and upkeep expense?

There are two general classes for all water systems:

Gravity systems: Simple, durable, low in first cost, upkeep and expense.

Pressure systems: Require constant attention. Keep water cooler. More sanitary.

Types of Water Systems

Cistern Pump in the Kitchen:—One of the simplest and least expensive types of water systems is where water is pumped from the cistern directly into the kitchen by a hand pump in the sink. This scheme is a great improvement over carrying the water by hand. Every farm house should have this much if no more.

The well should be within 50 feet of the house and the water in the well should not be over 20 feet below the kitchen pump, for water cannot be lifted more than 20 feet with a common cistern pump. Be sure the outdoor pipe is below frost line and the pipe above ground should be protected against freezing.—Miriam M. Haynes.

PROTECTION AND CARE OF FARM WELL

The well is the usual source of the farm water supply, and a good well—that is one which supplies plenty of pure, fresh and wholesome water the year round—is certainly one of the most essential and valuable assets of the farm. Without it no man could live there for long, to say nothing about bringing up a healthy family or building up an efficient dairy herd. The well must be there first, last and all the time, and we cannot conceive of any intelligent man buying a farm without a good well if he intended to live on it and may it pay dividends.

Fortunately most farms are well supplied with water—in fact it is a rare thing to find a farm where it could not be secured in sufficient quantities by drilling to reasonable depths. The supply, therefore, will probably never cause us any serious worry, but judging by a recent report on analysis of many well waters from this province, one seems justified in concluding that there is still need for education of the rural public in regard to the protection and care of the farm well. The following suggestions wil be found helpful to any farmer desirous of making his water supply safe against possible underground and surface contamination:

The first step in the solution of this problem of purer water supply is the location of the well. This should be by all means on ground higher than any source of contamination, such as barnyard, cesspool or outside privy. If there should be no choice in location and this cannot be done, then the well should be kept a considerable distance from such contamination, at least 100 feet in clay, and 200 feet in sandy soils, and the cribbing and top of the well specially protected, as detailed later, against the entrance of any seepage and surface washings. In the second place the cribbing for at least 10 feet below the surface should be made impervious to water so that any contamination in solutions reaching the well would have to pass down through this extra depth of soil before getting into the well, when in all probability it would be taken up by the soil and never reach the well water. This may be done in case of an old well by putting in a wall of puddled clay one foot thick and 10 feet deep around the well cribbing, and in case of a newly-dug well or recribbing an old one by using large concrete tile for the cribbing and setting the joints thoroughly in rich cement. Before the tile are placed in the well, the outsides should be washed with pure cement plaster in order to fill up all pores and make the tile absolutely impervious to soil waters. Thirdly, the cribbing should be extended at

Massey-Harris

A Tractor with Every Part Right

SOME of the features that make the Massey-Harris 12-22 H.P. Tractor the choice of the best farmers are: an Underslung Frame, which gives low centre of gravity; the Flexible Front Axle Connection to avoid strains on uneven ground; Short Turning Radius, although the Front Wheels are of large diameter; Powerful 4 Cylinder Engine; Transmission through Spur Gears exclusively; all Gears well protected; Belt Drive from Pulley without Gears; Water Air Cleaner; Easy Control; Ready access to all parts; Self-Steering when plowing; Economical and Durable.

DUPUY & FERGUSON
36-42 Jacques Cartier Square, Montreal

least one foot above the ground level and the soil banked up to the top of it to provide good surface drainage away from the well. Fourthly, the well should be provided with a strong tight-fitting cover made of heavy plank on concrete, so that it will always be safe for man and beast and proof against the entrance of dirt, small animals like frogs, etc. Even better still, the pump may be placed over a shallow dry well to one side and the top of the real well made absolutely tight by a concrete cover. In this case the well should be ventilated by putting a small iron pipe, with the exposed end turning downwards, through the top or cover. And fifthly, the stock should not be allowed to tramp about close to the well.

What has been said refers chiefly to dug wells, but even the drilled or driven wells should be well drained and protected at the top for otherwise contamination may work down along the well casing and reach the water, especially if the casing is not tightly driven into the rock below.

Attention to such matters of construction and protection of the farm well as I have detailed, and an occasional pumping out and cleansing of the well with a little lime will asure a pure and wholesome water supply.—Prof. Graham, of the O.A.C. in O. J.

EGG-PRODUCTION INDUSTRY OF TIENTSIN DISTRICT, CHINA

The prepared-egg industry in the Tienstein district was started several years ago and was in a flourishing condition up to 1918, when it was severely affected by the food laws and war restrictions of various importing countries, particularly the United States. In 1917 over 5,000,000 pounds of egg albumen and yolk, dried and moist, were exported, and in 1918 only 2,000,000 poundss. On the other hand, exports of fresh eggs increased in 1918 by 472,000 dozens over that of 1917. The total export of eggs in 1918 amounted to 5,344,000 dozens.

When the dried egg industry was first promoted in the Far East, all plants were equipped with trays and drums for drying purposes made of zinc, which resulted in a metal content in the product. A new method was then introduced by means of "spraying" or blowing the egg in a fine spray into a heated chamber. The resulting product is free from metal, and the various egg-drying plants in the interior, which are largely in the hands of Chinese, are gradually converting their establishments into spray plants, the initial cost of whose installation amonts to about $20,000.

There is, however, a greater demand for moist eggs not only in Europe, but also in America, where the consumer does not take kindly to powdered albumen. Although there is in America a good demand for the powdered yolk, local manufacturers can not be expected to sell the yolk without at the same time disposing of the albumen. The result has been an increase in the exportation of moist albumen and moist yolk and of fresh eggs. Frozen eggs are not shipped from this port as yet, owing to the fact that no refrigerator steamers ply to and from Tienstin. An American company is building a plant in Tientsin and will soon have a steamer with cold storage equipment operating between here and San Francisco for the transportation of frozen meat and eggs.

There are 13 albumen factories located in this district,11 of which are Chinese, and 3 foreign. The Chinese concerns, with the exception of the Ching Sing Egg Co. named below, are of the usual type, of egg-product factory and have no machines; but the foreign companies, which are managed by American and French, have installed American drying machinery for the manufacture of their products. These companies have passed the purely experimental stage and are doing well.—Extract from U. S. Commerce Reports, Mar. 13, 1920.

I have a horse that is troubled with worms. What would you advise?

Ans: For intestinal worms, use a vermifuge made as follows: Oil of turpentine, two ounces; oil of male fern, one drachm; linseed oil, half a pint. Give after a purge and on an empty stomach. Repeat the dose after a week, followed with a drachm of powdered sulphate of iron in the feed. For thread worms the treatment should be by injections up the rectum, made of oil of turpentine, two drachms; linseed oil, one pint. Use every morning for a week.

CLOVER CULTURE AND SEED SELECTION

(Continued from page 529)

mon: One is to cut the clover late in the afternoon so that the dew will not affect the plants. The following day, with the aid of the tedder, operations should proceed as rapidly as possible and the crop be placed under cover before night.

By the other method the clover is cut in the forenoon after the dew is off, and is raked into windrows and bunched into cocks in the afternoon and allowed to sweat for two or three days. When the weather is favorable the cocks are opened in large flakes and allowed to give off their moisture and then drawn to the barn.

Clover-hay loses much of its value if rained upon. Rain washes out the soluble portion destroys the aroma and favors the growth of molds—and makes the hay more woody. The chemist says that from 25 to 40 per cent. of the dry substance can be extracted by cold water. A sample of clover hay allowed to lie a fortnight in the rain lost one-third its content of fat and soluble starchy matter.

When grown for seed the crop must be allowed to get fully ripe. The seed will not ripen in any way after the hay is cut. The heads should be dead brown, and the seed well colored and plump when shelled out in the hand before harvesting is begun.

Cutting had better be done early in the morning as there is likely to be less loss of heads than if the work is done later in the day when the clover stems become dry and brittle. The cutting can be done with a mower or grain reaper or with the binder. If the mower is used it is advisable that two men remove the swath so that the horses will not trample it.

It has been argued by entomologists that were insects uncontrolled for two years and permitted to multiply that man would be starved off the earth. In so far as the clover crop is essential to man's existence this statement would hold true, for the presence or absence of certain insects has a great deal to do with seed formations and were the seed crop destroyed for two successive years we would be without means of reseeding our land as clover is a biennial plant. Generally speaking it dies at the end of the second year. These insects are the bees and the clover-flower "midge." The first is essential as a polenizing agent, for the clover plant is sterile to its own pollen, while the second insect destroys the flower and prevents the formation of seed.

Red clover is the chief food plant of the clover flower midge. It is rarely found on either white or alsike clover and never in sufficient numbers to affect seed production. The midge is a small mosquito-like fly which lays its eggs in the young clover heads. The tiny maggots that hatch from the eggs destroy the seed producing parts of the flower. As the forage value of red clover is not impaired by the midge it is of economic importance only in seed growing districts.

It has been quite destructive in certain parts of the Province for a number of years and in one instance last summer it almost ruined the crop of one grower. Control measures are easily applied: Before starting the seed crop pasture the field with cattle or clip or mow the field and either allow the clippins to lie on the ground or feed the green stuff, or place it in a silo.

The object of these methods is to destroy the first brood of midge maggots by the cutting off and drying up of their food supply. The midge emerges about the first of June from an egg that has remained over winter in the soil, and lays eggs in the young green clover head. These eggs hatch out maggots within 5 days and these destroy the blossoms and remain in the head for about 4 weeks, when they drop to the ground and emerge at varying periods, depending upon the amount of seasonal rains, from two to four weeks, when the fly emerges and lays eggs in the heads of the aftermath crop destroying the seed in this crop also. By cutting the first crop when the blossoms are showing and when the maggot is salmon pink in color they can be starved out and killed. Consequently the second crop does not become infested.

The yield of seed per acre, or ton of clover hay, ranges from one bushel to five. One grower, Mr. McLaughlin, of Perth, had 3,000 lbs. of seed from about 24 acres, a yield of 125 lbs. per acre. At the present trend of prices he is sure of $100.00 per acre. Other growers have secured lager yields on smaller areas.

Up to the present this season the clover-huller has threshed out about six tons of seed and there still remains a great deal of thrashing to be done in the counties of Kent, Kings, and Northumberland. The clover seed growing industry is rapidly expanding and, with the increased knowledge of clover culture acquired by the farmer in recent years it is reasonable to expect that one day our dependence upon outside sources of clover seed will be removed.

DO NOT NEGLECT THE BEES

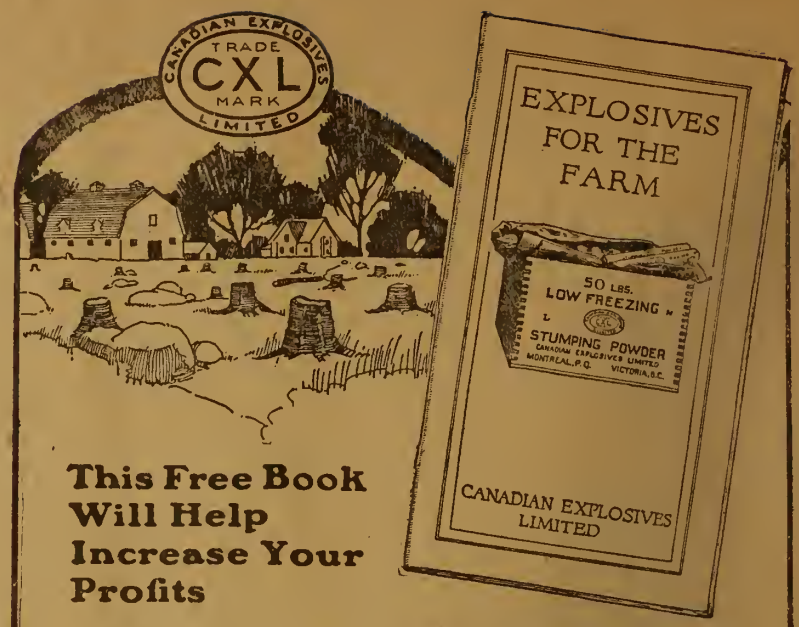
(Experimental Farms Note)

The present high price of sugar reminds us that Canada produces natural sugars that are still more valuable than the product of the refineries. Fortunate are those who not only possess bees at this time, but understand them and have supplied their needs.

The early spring months are the most critical period of the year in the life of the bee colony. At the same time, the pressure of spring work of cultivating, seeding, etc., on every fine day on the farm too often leaves the bees forgotten.

There are several reasons why the bees are more liable to be neglected than other things on the farm. Hidden away in their hives they do not require daily feeding like other animals. Such attention as they need is in the nature of a surgical operation, and the opening of the hive is not always anticipated with pleasure on account of the risk of receiving stings. Yet, on many farms, the bees have been found to pay better than anything else, considering the small amount of capital and labour expended.

The principal danger to avoid at this time of year is starvation. If each colony went into the winter strong, with a good fertile queen and a plentiful supply of stores in the combs, the first examination of the hive had better be deferred until the weather is warm and nectar is being gathered. But if the stores are run-



This Free Book Will Help Increase Your Profits

—it can be done on your farm. You can make more money by increasing your acreage, enlarging your crops and making your planting easier. C X L Stumping Powder will do it and this book—"Explosives for the Farm"—will tell you how. C X L Stumping Powder will drain swamp land, irrigate the aridsection of your farm, remove stumps and boulders, break up your subsoil and help in your tree planting—and do it for less money. From the standpoint of cost and profit, you cannot afford to be without C X L Stumping Powder on your farm.

WHAT FACTORS INFLUENCE SEED YIELDS IN ROOTS?

(Experimental Farms Note)

During the last few years considerable quantities of field root seed, including Mangel, Swede turnip, and Carrot seed, have been raised by the Dominion Experimental Farms' System for the purpose of safeguarding against a threatening shortage in the supply. Much valuable information has been accumulated on the subject of root seed production, the more so because, while engaged in seed growing as an emergency undertaking, the Experimental Farms' System at the same time desired to gain reliable data bearing on the possibilites of making root seed growing a permanent agricultural industry in Canada.

One of the more important subjects in connection with root seed growing which have been investigated is the question of under what conditions the heaviest possible seed yields may be expected. This question is of course of particular interest, as the size of the seed yields will largely determine the profit from seed growing.

In the first place, it is necessary that the roots to be used for seed raising are absolutely sound when planted out. Our experience is that planting of roots which show signs of disease or rot, especially at the crown, leads to most disappointing results. Such roots may linger along for some time, but sooner or later they die off, with the result of course that the seed field becomes patchy and consequently gives a comparatively low yield per acre.

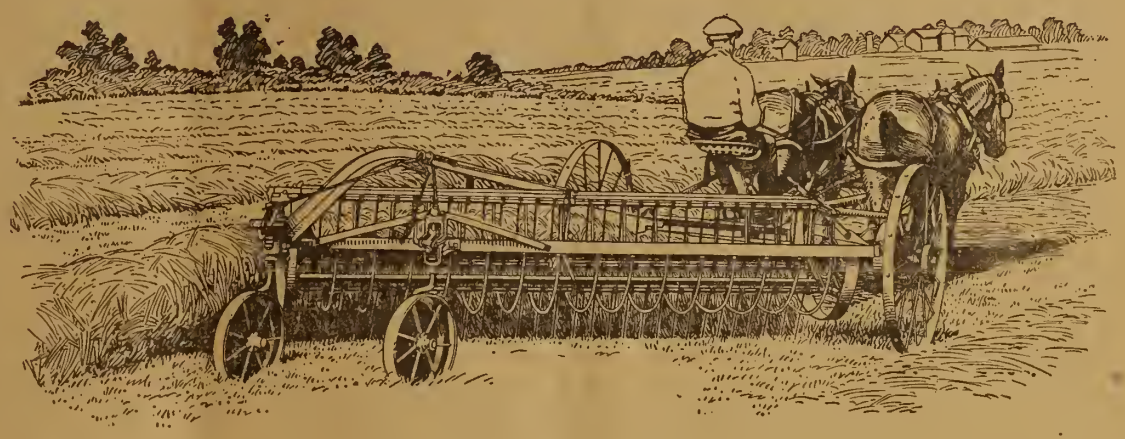
In the second place, the seed roots should be planted as early as possible in the spring. The earlier they are set out the heavier are the seed yields which may be expected. This applies to all kinds of field root seed crops, and has been demonstrated over and over again.

In the third place it is absolutely necessary that the land is in good tilth and in a high state of fertility. Several experiments conducted the last few years have most decidedly shown that the land must be in the best possible shape if good seed crops are to be expected. An experiment carried out at Ottawa in 1915 gave results to the effect that an application of 20 tons of barnyard manure to the acre, or of a commercial fertilizer, composed of 500 pounds of Superphosphate, 200 pounds Muriate of Soda, and 200 pounds of Mcriate of Potash, increased the seed yield of mangels with almost 50 per cent. Experiments carried out later have not only substantiated this result but also shown that a still greater increase in the yield may be realized if the land is given both manure and artificial fertilizers in liberal quantities.

Sound roots, early planting, and rich land are the main factors which determine the size of the yields. It should be added, though, that the yields are also influenced, to a not unimportant degree, by the supply of farm labour that may be available and by the size of the seed fields. Profitable root seed growing requires plentiful labour at certain periods and under present conditions, the writer would say that to a farmer who has not had years of experience in root seed growing, one or two acres may prove more remunerative than a large acreage, because with a small acreage, the yield is apt to be much greater per acre than if the acreage is so large that it cannot be handled conveniently.

M. O. MALTE,
Dominion Agrostologist.

Air-cure Your Hay the International Way



IT ISN'T sun-drying that puts quality into hay, but *air-curing*. And hay is air-cured best when side-tedded into light, breeze-sifting windrows such as those that trail off in the wake of

International Combined Side-delivery Rakes and Tedders

You can follow closely behind the mower with this machine and rake the hay before the leaves begin to wilt. The teeth strike the heads of the hay first and rake clean, picking up every last wisp — and there is no shattering of leaves. The hay is turned completely over and deposited in snug, airy windrowsthrough which the air circulates freely, curing evenly both stems and leaves with its magic touch.

There are points of mechanical excellence that distinguish this fast-working, gentle hay-handling machine from all other types of side-rakes and tedders. There are also many points of mechanical excellence that distinguish all hay machines made in the International Harvester factories — **McCormick** and **Deering mowers** and **self-dump rakes, International sweep rakes, stackers** and **loaders.**

Ask your nearby International agent about these good hay tools.

MARKING OPEN FRUIT PACKAGES

Sub-section 3 of Section 320 of the Inspection and Sale Act, Part 9, as amended in 1918 requires that:

"Every person who, by himself or through the agency of another person, packs fruit in an open package, intended for sale, shall cause such package to be marked, before it is taken from the permises where it is packed, with the initials of his christian names and his full surname and address, or in the case of a firm or corporation, with the firm or corporate name and address in a plain and indelible manner, in letters not less than one-quarter of an inch in length. Provided that any co-operative association or person dealing wholesale in fruit may cause the package containing such fruit to be marked with his own name and address, but such packages must also be marked with a number or other mark approved by the Minister which will designate who is the original packer of such fruit."

WHOLESALE DEALER'S RESPONSIBILITY

Wholesale dealers desiring to receive consignments of fruit in open packages marked with their own name and address, and without the name of the packer, must cause such packages to be marked with a number or other mark, which will designate the original packer of the fruit. This number or mark must receive the approval of the Minister of Agriculture.

PACKER'S RESPONSIBILITY

In no case where a number or mark is used to designate the original packer of the fruit, is the packer relieved of the responsibility for the proper packing and grading. He is liable if he omits to mark his name and address on the fruit package, if a shipping number is used which has not received the approval of the Minister of Agriculture. It is therefore necessary that every packer desiring to ship in accordance with these provisions, should assure himself that the shipping number or other mark which has been furnished him by the wholesaler, has received the approval of the Minister of Agriculture.

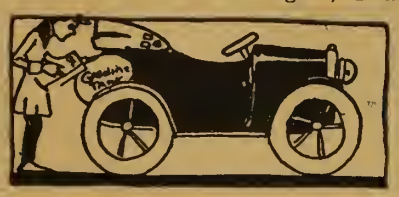
HINTS FOR THE MOTORIST by ALBERT L. CLOUGH

THE FABRIC UNIVERSAL JOINT

Until recently the universal points required to convey the varyingly directed driving force from the transmission to the rear axle as well as the flexible joint, required in some designs between the clutch and the transmission, have been more or less complicated mechanisms of the Hooke's joint, ball and socket or Oldham type, consisting of metallic parts moving one upon another and requiring constant lubrication. They have too often been neglected in this regard, with the result that their parts have worn rapidly, become very noisy and developed lost motion which entailed disagreeable and destructive jerks at starting and in changing speeds. Quite lately, however, universal and flexible joints have begun to be adopted, which embody no moving mechanical parts, but in which the required variation in direction of the connected shafts is obtained through the flexibility of fabric discs interposed as driving members between the members subject to varying direction. The service required of these fabric discs is severe and their material must be adapted successfully to withstand continuously repeated bending, but they have the advantages of requiring no lubrication, of complete noiselessness, of cushioning the driving forces and of developing no lost motion. Their successful introduction will relieve the motorist of much trouble and annoyance. Even though such joints require rather frequent replacement, their use may still prove ot be warranted.

EXTRA LUBRICATION BY MIXTURE METHOD

H. R. J. writes: Before laying up my car, I had new piston rings put in and have been advised that, when placing it in service again, I add



about a pint of oil to each five gallons of gasoline put into the tank, to furnish extra lubrication for the rings, while they were working in. What result will this have and will it effect the gasoline?

Answer: This is a good idea, as small amount of oil is brought in with the fuel mixture and deposited upon the upper part of the cylinder walls, which the splash lubrication from the crank case may not reach effectively, in case the rings are excessively tight. It will reduce the danger of the new rings scoring the cylinder walls. Before starting the engine, it will be well to inject a little oil on top of each piston through a valve cap or spark-plug opening. We think you will find that the oil mixture has no troublesome effect upon the gasoline.

PREVENTING ACCIDENTAL BATTERY DISCHARGE

L. H. C. asks: Would it not be well, on storage battery equipped cars, to install a switch, by which the battery circuit could be broken, when the car is not to be used for several days at a time, thus avoiding waste of current through accidental leaks in wiring?

Answer: The idea is excellent, but we doubt its practicability. You would have to use a switch of large capacity in order not to introduce resistance that would affect the starting current and you might have trouble in finding room for such a switch, where it could not be short-circuited or affected by dirt and liquids. Introducing unnecesssary contacts into an already complicated system is gener-

ally indavisable, especially when they are very seldom operated. Frequent inspections of the wiring; a reading of the ammeter, when you leave the car, to see that it shows no discharge and the removal of a battery connection or of the ground connection when the car is to be laid up, are precautions which will prove pretty effective against accidental discharges.

WEAK COMPRESSION AFTER OVERHAULING

J. S. S. writes: I recently decarbonized my engine and put in a new head gasket, which I know to be perfect, but did not grind the valves, as they seemed all right. Two cylinders now show poor compression although they previously were tight. How can

I tell whether the rings or the valves leak?

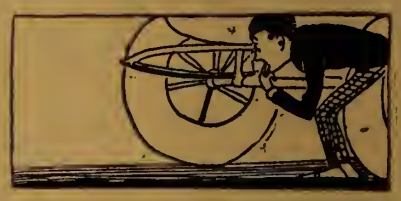
Answer: Take a piece of rubber tubing or hose and insert one end well into the crank-case breather or oil filler opening. Remove all spark-plugs except that of the cylinder being tested and have this cylinder cranked over compression, while someone listens at the free end of the rubber tube. If the rings leak, you should hear a hissing escape of air into the crank-case. By inserting the listening tube into the carburetor air intake and cranking the cylinder over, the blow back of air through a leaking inlet valve can usually be perceived, but without disturbing the piping, this test cannot be applied to the exhaust valve. If you have disturbed the push-rod adjustments perhaps some of them may be so close as to hold their valves open. Look out for particles of carbon on the valve seats and remember that unless oil has fully worked in under the rings, they cannot be tight.

LOOSE ENGINE PARTS AND THEIR DANGERS—HEED THE "POUND" BEFORE THE "SMASH" COMES

Knocking or pounding upon the part of an engine is so intensely disagreeable to the trained motorist and indeed to any mechanically inclined operator that immediate steps are generally taken to have its cause removed, but there are some drivers, who through indifference or lack of knowledge of the consequences, put off from day to day the repairs which such symptoms indicate are necessary and tolerate "pounds" until they become unsufferable or until the conditions which cause them have brought about very serious results. Pounding noises are the danger signals proclaiming that losseness exists in parts, which should be running in close continuous contact and they result from blows dealt by one part against another. The most common examples sare those of looseness in crank-shaft and connecting rod bearings, the former permitting the crank-shaft to play violently up and dawn in its bearings in the crank-case and the latter allowing the lower ends of the connecting rods to move relativey to their crank-pins, upon which they should run without slack or lost motion. Looseness capable of causing a pound is sure to aggravate itself very rapidly because the parts that strike together, under high velocity and pressure, act as hammers to batter one another's surfaces, deforming them rapidly into a state of even more pronounced looseness. Whenever two parts, moved by certain forces, strike one another the stresses produced in them are immensely greater than when they merely push one another and this makes the effect of loose engine parts most destructive The metal of the crank shaft, thus subjected to blows, tends to become fatigued and premature breakage may be the result, while the bolts that secure bearing caps in place, are prone to break under long continued pounding. When a bearing cap comes loose, especially a connecting rod cap, the engine may be almost completely wrecked, for the detached rod runs wild and is very likely to punch a hole through the crank-case or break the cylinder block casting and to get in the way of the cranks, thus springing the crank shaft, out of line—damage which is not easily repaired. The moral of al lthis is, that when a pound develops, it should be understood as a solemn warning, which should be acted upon at once and not put off. If this is not done, the looseness which gives rise to the noise will increase rapidly, damage already done to the parts will be greatly augmented but the most serious possibility is that parts may break loose and smash the engine.

ARE SNUBBERS OF VALUE

S. H. C. writes: Do not snubbers improve the riding qualities of a car and prevent the snapping of springs by the upward motion of the body after a severe jolt?



Answer: They do. In some respects snubbers are superior to other forms of shockabsorbers.

Your Protection Against Weather

"Save the Surface and You Save All"

Economy

Ready Mixed House Paint

Whether your house is frame, brick or stone, there is some woodwork about it.
The length of time that woodwork is going to last depends on the protection you give its surface.
Economy Ready Mixed House Paint is the best protection. It is scientifically compounded to resist weather attacks. Pure materials and scientific manufacture make it chemically perfect.
Use it for your farm dwelling, inside and outside. The price is moderate.

Sterling Shingle Stain

Gives like protection to your roof. Absolutely waterproof. Will not fade. Comes in attractive shades.

Longwear Barn Paint

For barns, bridges, fences, farm machinery, etc., supplies a big paint-need on the farm. Best protection for rough wood and metal surfaces.

LAMP BULB SIZES AND GEAR SHIFTING

J. K. H. sks: (1) Will it do any harm to use, in my headlights, stronger bulbs than the factory recommends? (2) What can I do to prevent that grinding noise, which occurs when shifting gears?

Answer: (1) No. But, of course, they will increase the drain of current from your battery. (2) Be sure that pou push your clutch away out, especially when changing from a lowed to a higher gear. Try to have the car speed and the engine speed so proportioned one to the other that the gears to be meshed are running at about the same speed before trying to force them together. Take time and be gentle in shifting, feel-

ing the gear edges to be sure conditions are correct, before useing force on the lever. Don't try to engage low or reverse when the car is moving. In changing from high to secong, go into neutral, let in the clutch, speed the engine slight, throw out clutch and then mesh the gears. If your car is equipped with a clutch-brake, to prevent the clutch from spinning idly, be sure that it is properly adjusted and that it produces the effect intended. Use lubricant of the right consistency in the gearbox.

AMMETER READS INCORRECTLY

T. C. asks: What caused the ammeter on my car suddenly to begin to indicate incorrectly. When the engine is stopped it now reads several ampheres "charge" and the amount of current shown, when the lamps are on, is much less than it should be. Can it be fixed?

Answer: The only thing we can

think of is that the instrument has suddenly been thrown out of calibration or the pointer has become bent by some accident, so that it fails to indicate zero when no current is passing. The most common way in which this sort of thing happens is from the effect of a short circuit in the wiring. This permits such an immense current to flow that it strikes the pointer violently against the stop on the "discharge" side of the instrument, permanently bending it. If the glass can be removed you may be able to carefull bend the pointer back, so that it zeroes correctly. If not, you better return the instrument for repairs.

ENGINE IS INCLINED TO KNOCK

H. & J. write: We have a 1914 —— engine of which has recently acquired a knock, when pulling a grade slowly or when being accelerated quickly. The best mechanics tell us that it amounts to nothing, but we lose power on account of having to retard the

spark so much in trying to keep down the knock. Can you give us any helpful suggestion?

Answer: We assume that this engine is in perfect mechanical condition, that it is free from carbon, that the fuel mixture is correct, that the cooling system is operating normally and that the ignition is properly timed. It is a well known fact that, in order to increase their power, these engines were given a compression ratio which was very near the practical limit at that time and which in many instances has proved somewhat higher than can be successfully utilized with present-day gasoline. We have known of several instances in which compression has had to be reduced to prevent knocking and yours may be a case of this kind. We suggest that you install a set of "low compression" valve-caps, which the manufacturer can furnish and, if this change does not stop the knocking, that you shim up the cylinders by the use of a liner between the crank-case and the cylinder flanges.

PESSURE FUEL FEED SYSTEM LEAKS

A. W. S. writes: The car that I am driving has a pressure fuel feed system and gives me endless trouble, because the pressure is not retained. Even after a short stop, I have to work the hand pump before I can get gasoline to the carburetor and, when the tank is nearly empty, this is quite a tiresome job. What can you suggest?

Answer: Doubtless you can in time discover and stop the leaks which reduce your pressure so rapidly, but we believe that it would pay you in the end to tear out this pressure system and install in its place a modern vacuum feed system. The expense incurred would not be great and we fear that you will experience frequent trouble with your present system, so long as you keep it. If, however, you decide to "tighten up" your old system, first locate the leaks by taking a

brush and soap solution and brushing over all joints of every description in connection with the hand and power pump, the air line and the fuel tank. Keep the pressure up, meanwhile, and wherever soap bubbles form, stop the escape by soldering, by the provision of new fitting or packings or in some such manner. Be sure that the check valves in the pumps work properly and do not permit air to blow back.

ENGINE "FALTERS" AT HIGH SPEED

H. M. Y. writes: My Ford pulls the hills well enough and I have little fault to find with it when running slowly, but when I try to get it above a certain speed, it misses, sputters and will not go any faster. Where is the trouble most likely to be found?

Answer: The following are a few of the possible causes: The timer may be so worn that, while the roller makes reliable connection with the contact segments at lo wspeed, its track is so uneven that, at high speed, it tends to jump and no longer makes infallible contact with the segments. Some of the valves may be inclined to stick in their guides, owing to roughness or warping of their stems and they may

fail to seat in time when the speed exceeds a certain value Weakness of some of the valve-springs may aggravate this behavior. It is also barely possible that the gasoline line is somewhat obstructed and not quite enough fuel can be supplied to keep the mixture up to normal strength, when the engine is drawing charges fast. You better inspect the timer, test the valves and their springs and see that the gasoline pipe is clear.

Experience Saves Money in this Maxwell

THE 300,000 Maxwells built to date saves you many a worth while dollar in the new Post-War Maxwell. Those 300,000 saved in many ways.

Maxwell

More miles per gallon
More miles on tires

1. They taught "short cuts" in manufacturing.
2. They eliminated all experimental work—you don't have to pay for a single engineering mistake.
3. They developed quantity production which has reduced "overhead."
4. They enabled quantity purchases; and better materials are bought at lower costs.
5. They taught how to build an almost trouble-proof car; you seldom take a Post-War Maxwell to a repair shop.
6. They taught how to get the most mileage out of a gallon of gasoline, a pint of oil and a set of tires.
7. They taught how to build a car that the less skilled driver would find simple to operate and take care of.
8. They taught that it was better to build more and take less profit per car rather than build less and take more profit per car.
9. They taught how to put more and more value in the car without increasing the cost.

This Post-War Maxwell is next year's car. It contains features developed during the war, many of which will find their way into other cars in the summer of 1920.

MAXWELL MOTOR CO., OF CANADA, LIMITED, WINDSOR, ONT.

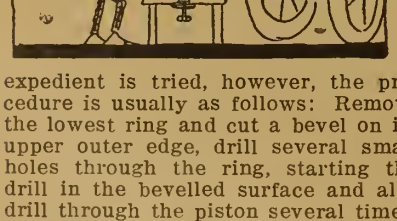
HOW CYLINDERS WEAR OUT

Cylinders and pistons made of the best metal and originally well fitted, wear with extreme slowness if only they are kept continuously well lubricated. Very often they still remain in perfectly usable conditon when the car which carries them is discarded, because its style has become obsolete or because of mechanical defects external to the engine. Mileages well up in the ten thousands may be expected of good cylinders—always assuming conscientious lubrication. The motor car engine piston acts not only to receive and transmit gaseous pressure but also to guide the motion of the connecting rods, the piston iself functioning as a cross-head and the cylinder walls as a guide and thus all the bearing pressure imposed upon these parts cause friction and wear on their opposing surfaces. All these forces act in one plane, namely in that at right angles to the crank shaft, with the result that piston cylinder wear is almost entirely in the plane of connecting rod motion and practically absent in the plane perpendicular thereto. When new, the cross sections of the cylinder bore and the piston are perfect circles, but their wear being all in one plane, both parts wear elliptical, the cylinder bore diameter in the connecting rod plane becoming elongated and the piston diameter in this plane becoming shortened so that finally the cylinder bore and piston cross sections become those of two ellipses with their longer diameters at right angles. The inaccuracy is, of course, relatively slight, but sufficient to leave two crescent shaped spaces on opposite sides of the piston which finally cannot be packed. Gas tightness being the essential condition for successful operation, when it becomes impossible to pack the piston tightly in its bore, the parts are no longer usable. Moreover, the ellipticity or ovalization, prevents the perfect functioning of piston and cylinder as cross-head and guide and the piston, as it moves up and down, vibrates from one side of the bore to the other or "coks up" so as to fill the waste space, producing the noise commonly known as "piston slap." Piston tightness is entirely dependent upon the piston packing rings and the oil which collects around them and, as these rings are circular in form, with a tendency to expand against the cylinder wall, it is not to be expected that they can pack a bore which is ovalized to any marked extent.

CYLINDER PUMPS OIL

H. W. C. asks: Will drilling one-eighth inch holes in the bottom of a Ford piston stop the oil working past it and, if so, where is the best place for them? The cylinder is not scored and I have tried an oversize piston and rings.

Ansyer: We doubt it. When this

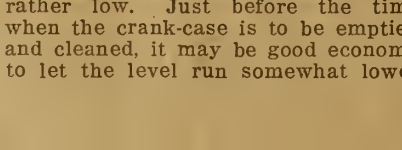


expedient is tried, however, the procedure is usually as follows: Remove the lowest ring and cut a bevel on its upper outer edge, drill several small holes through the ring, starting the drill in the bevelled surface and also drill through the piston several times, starting the drill in the ring groove. The bevel is supposed to catch oil scraped from the cylinder walls, which is returned to the crank-case through the holes. If it is the front cylinder that gives trouble, you might try drilling a small hole in the oil supply pipe, so that part of the oil will be delivered to the second crank-case compartment. In case this engine is rather an old one, we fear that the troublesome cylinder has worn somewhat oval, so that rings cannot make it tight, in which case boring out the block and fitting new pistons is the only thing likely to give you permanent relief.

WHEN TO SUPPLY ENGINE OIL

L. H. C. asks: Is it better to keep the oil indicator on the engine base at "full," by adding oil frequently or to wait until it is down to "one-half full" and then add the larger quantity required?

Answer: The former is the safer practice, since it affords a larger margin of safety in that the car, on the average, can be operated longer without attention as to lubrication and without danger than as if the level were frequently allowed to become



rather low. Just before the time when the crank-case is to be emptied and cleaned, it may be good economy to let the level run somewhat lower than usual, as less oil will then have to be thrown away but, as a general practice, we recommend keeping the system filled, by adding whatever oil may be required each morning or oftener, of course, when the service is strenuous.

DEALING WITH THE WORN CYLINDER — CIRCULAR CANNOT PACK ELLIPTICAL CYLDERS

The first sign of wear between a cylinder and its piston is lack of tightness between them, which results in the escape of the gases, when the compression stroke is being performed. When this leakage cannot be attributed to imperfect seating of the valves, faulty piston fit is indicated. Installing new rings is the natural recourse and it may restore the original tightness in case the old rings have so worn that their ends do not nearly meet, if they have become loose in their grooves or have lost their spring or have broken, but it will not give satisfactory results if piston, and cylinder wear have progressed so far as to have resulted in considerable ovalization. If the piston, when removed, does not show large areas where it fails to follow the bore (as indicated by blackened portions) and, when cleaned of oil, cannit be wabbled in its bore by force applied to the connecting rod, while, at the same time, the rings are loose, weak in spring and blackened over parts of their faces, it may be hoped that new rings of good construction and of slightly larger size may improve compression. If they fail to do so, the next step is to install pistons that are as much oversize as can be used without causing binding when they become hot. The new pistons are, of course, truly circular in section and their use reduces the total ovalizing effect—rings of the full allowable oversize being used with them. It should have been remarked that unless the cylinder bore possesses a mirror like polish and is free from scratches or scores, the above mentioned expedients are of little value. Finally, in the history of a cylinder a time may come when oversize pistons and rings do not restore compression or prevent excess oil from reaching the combustion space. The piston then usually shows large blackened areas and noticeably bright, worn areas one toward the top and one toward the bottom on opposite sides in the connecting rod plane. It can usually be wabbled in its bore, when all oil is cleaned off. Measurements taken by micrometer calipers

RESULTS

THE growing demand in motor cars is for lightness in weight without the sacrifice of strength and efficiency. Just as the light battle cruiser proved its efficiency with the British Fleet so the McLaughlin Light Six is establishing new efficiency and economy records with thousands of Canadian owners.

McLAUGHLIN MOTOR CAR CO. LIMITED

Model K-Six-63 Special M51

The McLAUGHLIN LIGHT SIX

will then show that the bore diameter in the connecting rod movement plane is decidedly greater than in that at right angles thereto and piston slap may have become noticeable. When measurements show more than 0.003 or 0.004 inch difference in the bore diameter it is generally considered that first class results as to tightness cannot be obtained without having the cylinder (and its mates) rebored, which is the only means of restoring a truly circular cross section and insuring operative tightness.

TRAILER INQUIRY

L. H. C. asks: Will a 23 horsepower auto, on low gear, pull as great a load on a trailer as will one good, strong horse? How should a trailer be fastened to a car to enable it to turn corners properly?

Answer: We have no figures as to the pulling ability of such a horse or as to the actual horsepower of an engine thus rated, and can therefore give you merely an opinion. As a guess, we should say that, on a good road and assuming the wheels not to slip, the car would pull more than

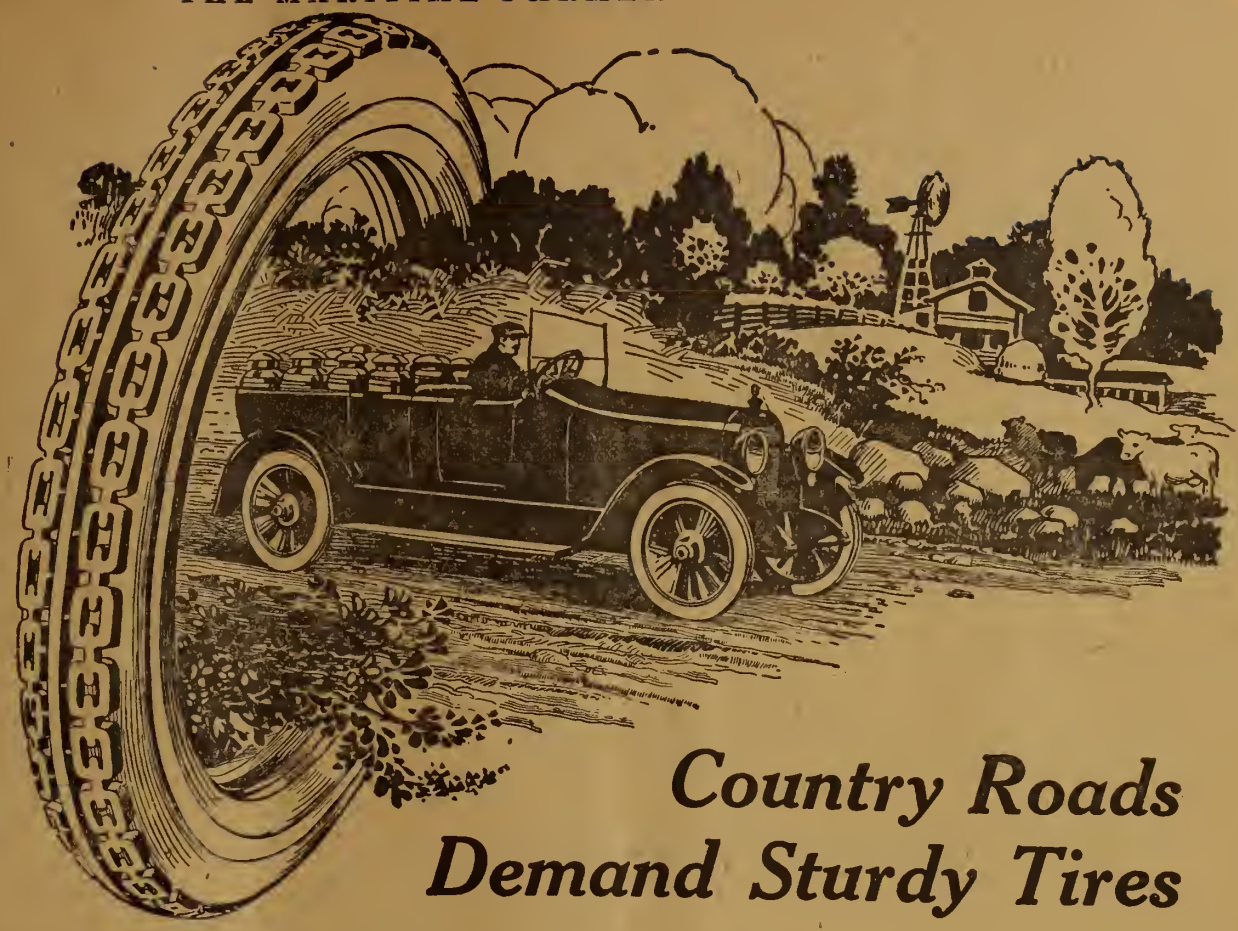
the horse could for any considerable length of time continuously, but that the horse could start and pull for short distances a greater load than the car, especially if the road were poor. A two wheel trailer is attached by fastening its tongue or draw-bar (usually through some sort of heavy spring), to a fitting, made fast to the rear cross member of the car frame. Four wheel trailers should preferably be specially constucted vehicles, with regular motor car type of steering gear, in order to follow the tractor propely aound corners, but ordinary four wheeled vehicles, connected in the ordinary fay, can be used where traffic conditions do not require sharp turns.

DETERMINING ENGINE OUTPUT

W. R. T. asks: Will you please publish an explanation of the method by which the horsepower of a gasoline engine is determined?

Answer: The engine is connected to a dynamo, by connecting its crank shaft directly to the dynamo's armature shaft and the engine is then run at full output, while the power given by it to the dynamo is measured. The horsepower delivered by an engine is found by multiplying the torque or twisting force in foot pounds furnished at its shaft by its speed in

revolutions per minute and dividing the product by 33,000. The dynamo used s generally of a special type, known as an electrodynamometer, which measures the torque directly, appropriate allowance being made for electrical and mechanical power losses, and the speed is measured by a tachometer or revolution counter. As you probably know, the horsepower rating given to a gasoline engine is purely conventional and gives little idea as to what it actually can do. It is obtained by multiplying its cylinder bore in inches, squared by the number of its cylinders and dividing the product by 2.5. The result represents what an engine may be expected to deliver when each of its pistons is moving at the rate of 1,000 feet per minute.



Country Roads Demand Sturdy Tires

If the roads you travel are as smooth as Yonge Street in Toronto, or Portage Avenue in Winnipeg, you don't have to be particular about which Dominion Tire you put on your car. Any of them will serve you well.

BUT—if you have to bump over ruts and ditches—and if you use the car for country driving—then get the Dominion Tire best suited to the roads and the loads.

There are six treads to choose from—"Royal Cord", "Nobby", "Chain", "Dominion", "Grooved" and "Plain", for every car and every purpose.

DOMINION TIRES

ARE GOOD TIRES

The steadily increasing demand for them by experienced motorists is the best proof of their leadership.

Dealers who handle DOMINION TIRES also carry DOMINION INNER TUBES and the full line of Patches, Sleeves, Reliners, Cement and other DOMINION TIRE ACCESSORIES.

Two Cents a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 2 cents a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is 2 cents a word, each insertion. MARITIME FARMER, Sussex N. B.

We have a number of fine young registered bulls, to offer. They are sired by Prince Colanthas Canary B., and out of good producing dams.

We can make prompt shipment. Correspondence invited.

S. DICKIE & SONS, R. R. No. 5, TRURO, N. S.

BULL'S CREEK FARM

R. O. M. HOLSTEINS

EXTRA SPECIAL—I recently imported several Tuberculin Tested R. O. M. daughters of "Sir Lyons Segis" whose six nearest dams average over 30 lbs. butter each in seven days. These cows have in turn been bred to "Riverdale Lyons Echo Posch" whose dam, grand-dam and great grand-dam and dam's sister average officially 34 lbs. butter each in seven days. Am offering young bull calves of this remarkable combination of breeding and will sell a heifer calf or two. Get your orders in quick, they won't be here long.

J. H. STOCKTON, BULL'S CREEK FARM, WOODSTOCK, N. B.

Special Offering

Maple Green Farm Holsteins

On account of the great shortage in the supply of milk in our home town, we have decided (with regret) to dispose of our entire crop of Bull and heifer calves.

If taken inside of the next 30 days will price them away below their value.

The Dams of these calves are now running in the R. O. P., and the last official test conducted by the R. O. P. inspector showed an average test of 4.62% fat for the lot.

All are sired by our 32.32 lb. herd sire "King Korndyke Johanna", whose Dam is a full sister to Canada's Champion R. O. P. cow, "Jemima Johanna of Riverside". Milk in 365 days 30373; butter in 365 days, 1280 lbs.

Phone or write,

R, L. HICKS
DALHOUSIE JCT., - - - N. B.

FOR SALE

Pure Bred Registered Percheron Stallion "King Ferdinand", foaled March 16, 1916, pure black in color, broken to work, weight 1600 pounds, sired by Gresham, champion of Maritime Provinces. Dam, Lady Belle, equally undefeated.

This is a splendid opportunity to secure a horse of exceptional good breeding. Inspection of stables solicited.

For Price and particulars, apply

COMFORT CONVENIENCE

ECONOMY EFFICIENCY

Electrify Your Farm

There is not a moment of the day or night but what the farm has need of electric power and light.

Increase your farm's production. Give your family City conveniences. Install

Northern Electric POWER and LIGHT

If a well lighted house and barn—positive fire protection—running water—electrically-operated churn, separator, root cutter and grindstone appeals to you—if your family is to enjoy the labor-saving of the electric washing machine, electric iron, vacuum cleaner, fan, etc.,—if your children's eyesight and the health of your wife and daughters are to be preserved, and if your family want spare time for other things—if your main help, your boy, is to stay on the farm—then you should electrify your farm.

When you are considering the purchase of a trustworthy Power and Light plant, deal with the Northern Electric Company Limited, who, for twenty years, have been supplying equipment and helping in the organization of Rural Telephone Systems in every part of Canada. We know the Canadian Farmer and understand his problems and will not jeopardize our reputation by offering him anything but the very best for his money.

In Northern Electric Power and Light plants you will find the ideal electric system for your farm. Inexpensive to install, low operating cost, time-tried and dependable—a plant that will give you unfailing service.

Our nearest house will gladly send you interesting Power and Light literature. Write now.

Overland
TRADE MARK REG.

New *Triplex* Springs End "Rough Riding"

THOSE who do not confine their driving to city pavements will appreciate the way wheels and springs of the new Overland adjust themselves to road roughness, while car and passengers are remarkably free from jolts and jars.

The *Triplex* Springs in Overland give an entirely new kind of light-car riding comfort.

Instead of twisting, swaying, jolting, bouncing—instead of rough riding, the passengers in the new Overland glide smoothly along.

Triplex Springs secure for this car of 100-inch wheelbase the steadiness and road-holding ability of a long, heavy car. By warding off road shocks, they protect the car's mechanism and prolong its life. Combined with light weight, they give it remarkable economy in fuel and upkeep.

The equipment of this Overland is complete from Electric starting and lighting to rain-vision windshield. Take the first opportunity to see and ride in this modern, high-quality car.

Flying Sparks die out on Brantford Asphalt Roofing

The best way to economize

The best way to economize is to buy roofing with the quality put into it that will make it last longer than ordinary roofings.

Asphalt is one of the most enduring materials known to science—especially if the hard, brittle asphalts are blended with the soft, pliable kind, which produces an asphalt of remarkable toughness, elasticity and durability. This is what we do to get the very best grade of asphalt for the saturation and coating of

Brantford Asphalt Roofing

The saturation of the felt in Brantford Roofing is done at the high point of more than 350 degrees. This makes the saturation complete, every fibre of the felt being soaked through and through with the asphalt.

Brantford Asphalt Roofing does not evaporate under the heat of the sun. Neither does it absorb moisture, freeze or crack. It is also a wonderful fire-resistant, the insurance companies classifying it as a non-combustible. Farmers need not hesitate to put it on barns or other buildings close by railroad tracks, because flying sparks from locomotives or threshing engines that fall on Brantford Asphalt Roofing are harmless and quickly die out without injuring the roofing.

If the interior of a building should catch fire, a Brantford Asphalt Roof acts as a blanket and helps smother the fire. It never sends embers flying through the air to spread a fire.

Brantford Asphalt Roofing has been on the market for many long years—long enough to have proven its lasting quality beyond question. The first roofs covered with it are still doing yeoman service in resisting rain, snow, hail, frost, heat and wind.

Farmers who have roofed one building with it, choose it for the next building requiring a lasting roof. Unlike most other things, Brantford Asphalt Roofing has had a very small advance in price since the start of the war. By enlarging our output and installing new labor saving machinery we have lowered the cost of production, which helps offset the increased cost of raw materials. You need, therefore, not postpone doing the necessary roofing this spring on account of a price consideration. The outstanding value of Brantford Asphalt Roofing, considering to-day's conditions, makes roofing with it a real economy.

Brantford Asphalt Roofing is made in three thicknesses. No. 1 is 60 lbs. per square. No. 2 is 70 lbs. No. 3 is 80 lbs. Both surfaces are sanded, which adds to the weight and durability of the roofing.

Brantford Rubber Roofing

has the same high quality asphalt saturation and coating as Brantford Asphalt Roofing, but it has a smooth rubbery surface instead of being sanded. It is also in three weights.

No. 1 is 40 lbs. No. 2 is 50 lbs. No. 3 is 60 lbs.

Leatheroid Roofing

Slightly lower quality than Brantford Rubber and used for same purposes. Has a leathery surface. Exceptionally good roofing at a low price. 35 lb., 45 lb., and 55 lb. weights. Samples and prices mailed on request.

Standard Mohawk Roofing

This roofing is made of same materials as Brantford Asphalt but is lighter in weight. It is the best quality of any low price roofing on the market. It is a standard that has been tested for years and given entire satisfaction. Sanded on one side. One weight only—40 lbs.

Climax Sheathing Paper

A tough kraft paper coated with high-grade asphalt. For use between footing and foundation of a building, between foundation and wall, between foundation exterior and the earth, below basement cement floors, underneath floors in houses, on walls before lath and plaster are put on—unequalled for damp-proofing and wind-proofing purposes.

PLANTS USED FOR TANNING

(Experimental Farms Note)

The essential feature in tanning is the precipitation of gelatine by the chemical substances to which the general term "tannin'" is applied, as the result of which hides become leather.

The tannins are of very wide occurrence in the vegetable kingdom and occur in almost all parts of the plant, but not always in sufficient quantity to be of commercial importance. In the plant known as Canaigre (Rumex hymenosepalus), which is really a species of dock occurring in Texas, it is found in the root; in many trees such as Hemlock it occurs in the bark; in the Sumacs it is abundant in the leaves; while in still other plants it is found in the fruits or in certain pathological growths known as "galls", such as those on various species of Oak.

Among plants growing wild in Canada which contain tannin is considerable quantities are the following species: The bark of Hemlock (Tsuga candensis) yields nearly 14% of tannin; the bark of White Spruce (Picea canadensis), Tmarack (Larix laricina), and Balsam Fir (Abies balsamea) contains 7% to 14%; the bark of Chestnut Oak (Quercus Primus), White Oak (Quercus alba), and Red Oak (Quercus rubra) yields 12% to 15%; the wood of American Chestnut (Castanea dentate) yields 8% to 10% of tannin, while the stems and leaves of different species of Sumas contain 16% to 24%.

The Horse Chestnut (Aesculus Hippocastanum) although not a native of Canada is fairly hardy at Ottawa. Its bark yields a considerable quantity of tannin, while analyses of the leaves made in different months of the year showed a percentage varying from 2 to 6½.

While the barks collected in May and June are said to contain the largest amount of tannin, further investigation seems to be necessary before the point can be regarded a finally settled, as the analyses that have been made of some species do not seem to bear out the above statement.

Increased attention is being devoted at present to the Sumacs as a source of tanning materials; in this group it is not necessary to destroy the tree as the leaves and not the bark are used. There are three Canadian species whose leaves furnish tannin in considerabe quantities. Dwarf Sumac (Rhus copallina) occurs in Southern Ontario, White or Smooth Sumac (Rhus glabra) extends from Nova Scotia to British Columbia, while Staghorn Sumac (Rhus hirta) is found from Nova Scotia to Ontario.

The best time to gather the leaves is during the month of July, August and September. The branch of the current year should be cut or broken in such a way as to leave a few buds at the base to continue the growth next season. The leaves contain a much greater amount of tannin than the stems. Green Sumac losses at 50% to 60% of it weight in drying.

The price paid for Sumac in the United States varies from 60 cents to $1.00 pr 100 pounds, according to the quality.

Further particulars will be found in Bulletin No. 706 of the United States Department of Agriculture, entitled, "American Sumac: a valuable tanning Material and Dyestuff," published in 1918.—J. Adams, Assistant Botanist.

The greatest important factor in connection with keeping records is that a man may know what he needs to make, and then to know what he is making. But the value of records does not end here. If a man is not making money they will help him to find out why he is not.

The Maritime Farmer

SUSSEX, N. B.

The Power on Your Farm Depends on the Oils You Use

However powerful your tractor, truck, gas engine or motor car, the amount of power you get out of them depends upon the fuel and lubricating oils you supply them with.

You may spend thousands of dollars on machinery, but unless you use the proper fuel and lubricating oil, you are not getting your full money's worth out of your investment.

En-ar-co

Petroleum Products *Ensure Maximum Power*

They are scientifically refined by workmen who have been specially trained in our own school, and passed a strict examination.

Thus you can depend upon En-ar-co products being of a uniformly high quality that never varies.

En-ar-co Motor Oil

Refined scientifically to remove clogging residue, it cushions the moving parts of your engine with a soft, velvety film, that prevents friction and increases your engine's power.

En-ar-co Motor Grease

For compression cups, differentials and transmissions alike. The product of a half century of refining experience.

White Rose Gasoline

A pure, dry, uniform gasoline that has made a wonderful record for dependability, power and extra energy. Puts "pep" into your engine.

Black Beauty Axle Grease

Ensures a smooth-running, wear-resisting axle. No compounds to clog or gum.

National Light Oil

Ensures a bright, clear light, without charred wick or sooty chimney, in lamps and lanterns. Gives steady warmth in stoves, brooders, incubators. The most economical tractor fuel.

Get En-ar-co Products from your dealer. If he can't supply you, write us direct and we'll see your order is shipped promptly.

This Game Sent Free

A fascinating game in which autos compete in a cross-country race will be sent FREE to any auto, tractor, truck, motor boat or engine owner who will fill out the attached coupon and mail it to us.

FAIRBANKS-MORSE QUALITY F M 100%

Brighten your Home and Lighten your Housework

No matter where you live, all the comforts and conveniences of power and electric light can be yours.

The "F" Power & Light Plant

means brilliantly lighted rooms at the touch of a button—stairways, cellar, pantry, all as bright as day in a second. No lamps to fill, no chimneys to clean, no danger from oil cans, matches, or overturned lights.

Better light saves the eyes and makes the home more cheerful and attractive to every member of the family.

The power from this plant means a wonderful saving of work around the house. It runs the pump, washing machine, churn, cream separator, and other light machines, and it does every job easily and quickly. It is so simple that it requires practically no attention to operate.

The "F" plant also supplies current for electrical appliances, such as electric iron, vacuum cleaner, toaster, percolator, fan and heater.

The advantages of the "F" Power and Light Plant in the home appeal to every rural family, and its low price and economy in operation, enable most every house owner to enjoy the great benefits it makes possible.

Let us mail you a catalogue, which will give you complete particulars of the biggest possible improvement in farm house, rural residence, or summer cottage.

THE MARITIME FARMER

AND

CO-OPERATIVE DAIRYMAN

REGISTERED TRADE MARK

Official Organ of The Farmers' and Dairymen's Association of New Brunswick, The Nova Scotia Farmers' Association, The Nova Scotia, New Brunswick and P. E. Island Fruit Growers' Associations, The Maritime Stock Breeders' Association, The Maritime Bee-Keepers' Association and The Newfoundland Agricultural Board.

Volume 25. SUSSEX, NEW BRUNSWICK, MAY 11, 1920. Number 15.

CHARITY vs BUSINESS

Some Surprising Revelations in Regard to So-called Co-operation--Some Promises Made to Farmers and How They Have Been Redeemed

It is always well that a man know whereof he speaks, before saying too much.

In its first issue, the United Farmer's Guide is rather severe on thousands of farmers, who it asserts are in effect a lot of boneheads, and who have been seeking charity, simply because these objects of the Guide's wrath sought by co-operative methods to reduce the cost of commodities which are largely used on the farm.

The Guide directed its remarks at the Maritime Farmer, accusing us of all sorts of doubtful practise, but in reality, hundreds of members of agricultural organizations in the Maritime Provinces, for whom the Maritime Farmer only acted as an agent—(not putting one cent of money into any of the ventures the Guide condemns) were being upbraided. It was the money of the farmers which was used in these dark-dealings, which the Guide so roundly denounces—money not only used by them directly—but money advanced gladly, and willingly by the banks of which the article condemns so roundly.

The Guide opens up the whole question of co-operation in this way:

(1) Buying from a superficial viewpoint where the buyer gets all the advantage.
(2) Buying through an organization which adopts ordinary, every-day business methods, with all its overhead charges, dividends, etc.
(3) **Buying by Charity** as it has been good enough to designate the efforts of the Maritime Farmer, to procure for farmers the advantage of the cheapest available market.

As a matter of fact the Guide might have limited its methods to two—because number one is the system long ago adopted by the New Brunswick Agricultural Societies United, and subsequently by the Maritime Farmer.

There are two leading essentials to the conduct of a business along ordinary lines, as followed by the United Farmer organizations—cash, wherewith to buy goods—and customers. Each has a relative value to the business, and the **Maritime Farmer claims that the man who has the money to spend, is by far the more important factor in the building up of a successful business.**

Robinson Crusoe might have had unlimited stocks to dispose of but—.

The New Brunswick Agricultural Societies United quickly recognized the importance of the buyer to any co-operative scheme. So they started buying fertilizers co-operatively, and have succeeded in saving tens of thousands of dollars for the farmers of this province.

They did not do it by **charitable methods,** as the Guide insinuates. In every transaction a margin sufficient to cover cost of handling is provided for, and the farmer pays the bill.

How the money is secured.

The money for these transactions is advanced by the banks doing business in this province. No responsible farm organization need fear refusal, because the banks are anxious to do this class of business, and so far as the Maritime Farmer knows, have been only too glad to meet the requests for money from Agricultural societies promptly and courteously. In fact, no less than three banks are advertising in the Maritime Farmer for this very class of business. How successful the methods followed have been, is best demonstrated by the fact that the operations of the Agricultural Societies United have been conducted at a cost of less than one per cent. The goods are delivered for cash, the bank is repaid, the buyers (not the fellow with money to invest) have saved thousands of dollars and the business is closed for the year. Such is system number one, which the Maritime Farmer has followed. There is no mystery.

Buying Feeds

When fertilizers became popular, the Maritime Farmer was asked to buy feeds, co-operatively. It has done so. At first it was hard to get a supply, but the volume of business became so great, that the business became desirable, and there are now many bids for the trade. The Maritime Farmer has bought for hundreds of farmers, (in fact we bought the United Farmers of Woodstock, into touch with its source of supply, when it had hard work to find supplies.) **We gave this service free.** Having been able to buy for our readers, we asked that a guarantee of payment be made. This is done—we write an order—the goods are delivered—the draft is paid (by the farmers) who got their feed this year, (according to stockholders in the United Farmers Companies) one hundred and twenty-five dollars a car cheaper than some farmers who bought of the United Farmers. **This is more of the charity** to which the Guide takes objection. Well, charity begins at home—and we believe that most farmers have intelligence enough to desire to save the amount indicated on a car of feed—call it charity or what you will.

The farmers asked us to buy seeds this year—and we did. They placed their orders together and we supplied them at a cost **thousands of dollars per car cheaper than the farmers of Ontario were supplied by the United Farmers Co-operative Company Limited, 130 King St. East, Toronto.** More charity? Not one bit of charity in this, for the farmers who bought the seed, paid the Maritime Farmer for its trouble, paid the freight on the seed and then saved themselves thousands of dollars. (By the way, we bought a car of timothy for the United Farmers, Woodstock, in 1919, and we believe enabled them to save money for their customers.) Charity—says the Guide.

Well, we have said sufficient to indicate our idea of co-operation. We repeat that without the buyer no business can succeed. In co-operation, therefor, the **buyer** is in our judgment the first man to be considered.

Now let us study plan number two. The Guide is quite enthusiastic for it. So are the United Farmer's stores—the Grain Growers Co-operative Company and the United Farmers Co-operative Company, Toronto.

When the United Farmer stores started in this province, storekeepers were described as robbers, crooks, middlemen and what not.

It was declared that once the United Farmer stores were started, all prices were to be reduced and farmers **on this basis,** were invited to put money into the scheme. The Maritime Farmer time and again expressed the opinion that it costs a farmer's store just as much to do business, as any other—and our contention has proved correct.

In the catalogue of the Grain Growers Limited, appears a letter from Hon. T. A. Crerar, C. Rice Jones and John Kennedy, under date of February first, which says in part:

"But don't think the Company's prices can always be the lowest. We must learn to co-operate not only when there is an immediate benefit, but all the time."

Again the Farmer's Sun, organ of the United Farmers of Ontario, pleads that farmers must not expect too low prices, and urges that if it is charging a little morsel (say like $4450. additional on a car of clover seed) more than farmers were led to expect, it is justified in so doing—because others are making larger profits.

And the United Farmers, Woodstock, joins in the chorus and invites farmers to be big business men and to forget that they can save a hundred and odd dollars on a car of feed, or a few thousands on a co-operative order of fertilizer and stand by the cause.

The United Grain Growers Limited has been boosted again and again as a great object lesson in the benefits of co-operation.

Well, let us see who derives the most benefit. The paid up capital of that concern, as published in the Guide, is $2,500,000. About two years ago, according to a statement made by one of the leading officials of the organization, **the assets stood at $6,000,000. That is to say the Company had a surplus of $3,500,000.**

Where did the money come from? It must have been earned in the way of business, and it is evident that this immense sum was taken from farmers and retained by the company. **And for what? For service** is the reason given. That is to say, a co-operative concern (co-operative, mind you) more than doubled its capital, besides paying dividends to its shareholders. What the Grain Grower's Guide has said of concerns conducted on "those business principles which generally prevail in privately owned business" who have piled up surpluses much smaller than that mentioned above, it may well apply to the United Grain Growers, Limited.

It is this kind of co-operation that the Maritime Farmer opposes. What right has the Grain Growers Limited to assets $3,500,000 in excess of its capital, **when it so roundly denounces such methods in others?** Under real co-operation that three and a half million dollars should be back in the pockets of the **buyers** and not be available for men who have already been paid one dividend.

We leave it to any sane farmer to decide the issue for himself. If any group of farmers want feeds, fertilizers, seeds, binder twine, etc., we will get them a price. If that price is higher than they can secure elsewhere, **we say to them buy at the lowest price, quality considered,** and pay yourself the biggest dividend that you can possibly earn, the saving you make through real co-operation. Long before the United Farmer's Guide was dreamed of, the Maritime Farmer did its bit for the farmers of these provinces. Thousands of farmers know this—thousands of farmers appreciate the service.

IMPORTANT

Watch the Maritime Farmer co-operative notes from week to week. We have a most important notice appearing in this issue re eggs. We think that the Maritime Farmer has opened the way for some **REAL SERVICE** to the farmers of the Maritime Provinces. We expect as time passes to have other **CO-OPERATIVE** announcements to make, which will enable farmers in some respects to act as their own **MIDDLEMEN.** We believe we have made a real move for **your benefit.**

POTATO SPRAYING

By G. E. Sanders, Entomologist, in charge Insecticide Investigations, Entomological Branch, Ottawa

Mr. Chairman and Members of the New Brunswick Farmers and Dairymens Association:—

The subject of potato spraying is one in which I know most of you are interested, for New Brunswick farmers have a well deserved reputation for the quality of their potatoes, as well as for the quality which they produce per acre.

I am here to-day to give you, as briefly as possible, some of the results which we have obtained in investigating potato sprays in New Brunswick. I will first take up the question of increased yield from spraying potatoes, and then take up the question of insecticides and decreasing the cost of spraying.

Increased Yield from Spraying

In considering spraying we must regard our potato plant as a starch factory, the normal life of which is about one hundred days, and which we spend forty days in erecting or growing before beginning to produce from it starch or potato tubers. This leaves us sixty days in which to have our crop of potato tubers stored in the earth. Putting the yield at 300 bushels per acre, which is not unusual for a thoroughly sprayed field, we can readily understand that our acre of potatoes will store tubers for us for the last sixty days of its existence at the rate of about five bushels per acre per day, if insects and fungus diseases do not interfere with the health of the plants. That IF is a very important word, for to-day it is impossible to grow a field of potatoes and be sure of having them free from insects and fungus diseases, and the only method known of protecting plants from them is to spray or dust the plants thoroughly.

A second thing to be remembered is that the potato tuber only analyzes one per cent of ash, whereas the carbohydrates, crude fibre and ether extract total eighteen per cent. The water content of the potato runs about seventy-nine per cent, while the protein runs about two per cent. The one per cent of ash comes from the soil, and the eighteen per cent of carbon products, representing about 90% of the solid matter of the tuber, comes entirely from the air, being taken in through the leaves as carbon dioxide gas, which is converted in the leaves to sugar and starch, and is then transferred to the potato tuber for storage. This indicates to you the relative importance of the potato roots and the potato tops in the production of solid matter in the potato. Your soil and cultivation must be right in order to insure a sufficient and even supply of water, for water constitutes seventy-nine per cent of your tuber. Your potato leaves must be kept whole, green and healthy as long as possible for your carbon products, which are gathered only by the leaves, constitute eighteen per cent of your tuber, and lastly you add your fertilizer in order to supply your one per cent of ash, and a small portion of your protein. The roots are most important in growing the plant, but the leaves are most important in the storage of tubers.

The potato plant stores tubers at the rate of about five bushels per acre per day during its storing period, or roughly, during the last sixty days of its growth. For every day that you allow your potatoe tops to die short of their normal maturity, you therefore lose about five bushels of tubers per acre.

Potato tops are attacked to-day by both insects and fungus diseases. There was a time, which some of the older men can remember, when one could plant potatoes and be sure of them remaining green until the frost killed them. To-day we have both insects and fungus diseases attacking the tops. We know that proper spraying will control both. On account of it costing as much to apply spraying material as the material itself costs, Plant Pathologists, as well as Entomologists, always recommend combination spraying, that is, including an insecticide in your fungicide or vice versa. It is poor economy to apply either alone.

I will now give some actual results obtained at the Experimental Farm at Fredericton in 1919.

Average of Spraying Experiment No. 4342.

Average of twelve plots sprayed with Bordeaux, in bushels per acre.

Marketable.	Rotten	Small	Total.
519.25	4.41	20.83	544.49

Average of four unsprayed plots.

Marketable.	Rotten	Small	Total.
222.75	228.25	24.25	472.75

In this experiment spraying gave
296.50 bushels more shipping potatoes.
71.74 bushels more total yield.
3.42 bushels fewer small potatoes.
224.84 bushels fewer rotten potatoes.

Large Potato Fields at Experimental Farm.

Material	Marketable	Rotten.	Small	Total
Poisoned Bordeaux	398	0	14	412
5-2 Copper-Arsenic Dust..	378	8	28	414
No Spray.....	221	77	23	321

In these Field Plots Spraying gave
177 bushels more marketable potatoes.
91 bushels more total yield.
9 bushels fewer small potatoes.
77 bushels fewer rotten potatoes.

In the same Field Plots Dusting gave
157 bushels more marketable potatoes.
93 bushels more total yield.
5 bushels more small potatoes.
69 bushels fewer rotten potatoes.

These treated fields were all either sprayed or dusted four times. The cost of spraying will vary with the location but will never run over $25.00 per acre and will ordinarily run around $15.00 per acre. Your spraying material will cost you from $5.00 to $7.00 per acre, and an equal amount should cover your cost of equipment and labour. We applied the spray to these fields at the rate of 80 gallons per acre per application. The field in which our small plots were located and where we got an increase of 296.5 bushels of marketable potatoes per acre, did not receive any fertilizer. Considering the price to which potatoes have gone this winter we could have spent $593.00 per acre on spraying in that field, and still have got our money back, as a matter of fact we spent around $12.00 per acre on four applications, and reckoning potatoes at $2.00 per bushel our profits from spraying in one field were $581.00 per acre, less cost of picking up and shipping the extra amount of potatoes.

You will say that these figures are not average figures. That is true, but they are actual figures for that field. There is no doubt but that on average fields in average years you will not get such results as we obtained in that particular instance. The average increase of shipping potatoes per acre, due to thorough spraying, runs around one hundred bushels, and the cost of thorough spraying four times can never exceed $25.00, and ordinarily costs about $15.00 per acre. That is the same as buying potatoes at 15 cents per bushel, and in most seasons you would gladly pay 15 cents per bushel for sound potatoes lying on the top of the ground.

Some argue that potatoes may be so cheap in some years that they will not pay for spraying. Let us look into this argument. The land, equipment, fertilizer, seed, and labour entering into the production of an acre of potatoes will total roughly $150.00. The unsprayed plots in our experimental field returned 222.75 bushels of marketable potatoes per acre. These unsprayed potatoes cost 67.3 cents per bushel. Spraying will cost $15.00 per acre and adding this to the $150.00, we have the sprayed acre costing $165.00, and the return from it 519.25 bushels of marketable potatoes or the potatoes from the sprayed acre cost 31.9 cents per bushel. If potatoes should drop to 50 cents per bushel, the potatoes that cost 31.9 cents per bushel could be sold at a profit, while those from the unsprayed acre which cost 67.3 cents per bushel would have to be marketed at a loss. While these figures are not average figures, they are actually true of the plots that we had on the Experimental Farm at Fredericton last year, and they will prove relatively true on any farm in New Brunswick. I bring them before you to show that it is better business to plant fewer potatoes and spray them well, than it is to plant a lot of potatoes and neglect them. The man who does not spray is usually like the Irishman who was keeping store and selling below cost. When he was told of it he replied that even if he was losing money on every article he sold, he was doing a fine large business. This is true of a great deal of farm work and particularly true of our unspraying potato fields. We grow a large number of unsprayed acres and the profits are often in red ink, whereas those same acres well sprayed would shiw a real profit.

Our claim is that any farmer in the Maritime Provinces can on an average grow one hundred bushels more shipping potatoes per acre by spraying thoroughly four times with poisoned Bordeaux mixture, and the total cost of spraying will be about fifteen dollars.

Bordeaux Mixture

My paper would not be complete without giving the formula for making Bordeaux mixture. I may say that most of the men who spray in New Brunswick mix their Bordeaux in a manner that gives one of the best mixtures possible. You slake the lime and put the proper quantity, eight pounds into your eighty gallon tank when you begin filling. When the tank is about half full you add your copper sulphate solution, which should be eight pounds of copper sulphate dissolved in about twenty gallons of water. This method is easier on your pump than if you put in your copper sulphate first, and it also gives you a greater range of Bordeaux salts. Consequently more rapid action from the most soluble of them and greater lasting qualities from the most insoluble, than if you poured your lime into your copper sulphate solution.

In regard to copper sulphate or bluestone. The coarse crystals are better adapted to potato work than the pulverized material that we use on the apple. In dissolving bluestone, say you want to dissolve forty pounds, put forty gallons of water into a barrel and suspend in it, at the top of the water, a coarse sack containing forty pounds of bluestone. Each gallon of solution will when it is dissolved contain one pound of bluestone or copper sulphate. Always stir before dipping out. In making Bordeaux for an eighty gallon tank, stir and then dip out eight gallons into a barrel, add twelve or more gallons of water to this and then pour the dilute solution of bluestone into your lime solution in your spray barrel.

Insecticides

Just what insecticide or poison to use has been one of the serious questions during the past few years since Paris Green, the old standby, has soared so in price. In discussing poisons I will start with the most expensive, and take them up in order of descending cost.

Lead Arsenate

Lead Arsenate is the most expensive form in which to buy the element arsenic. It takes four pounds of dry or eight pounds of paste lead arsenate to poison an eighty gallon tank of Bordeaux for the potato. Lead Arsenate has the advantage of being very adhesive and safe on all classes of foliage. It is slow in its action. We have nothing against Lead Arsenate on potatoes excepting the high cost.

Paris Green

This is the old standby among potato poisons. On account of the demand for acetic acid for treating wood for aeroplanes, the demand for copper for munitions, and the high and still rising price of white arsenic, and soda ash, the price of Paris Green advanced very greatly during the war. Paris Green was originally made as a shutter paint, and it was only by accident that someone about 1865 discovered that the poisonous dry color, Paris Green, could be used with a fair degree of safety on potato plants and would kill the potato beetle. There are still some 3000 tons of Paris Green used per year in America. It has had to give away to cheaper and in some cases more effective insecticides in such specialized sections as Carleton County, the Niagara Peninsular, the Annapolis Valley, etc., but in general farming sections the Paris Green trade is thoroughly organized and in the aggregate an immense quantity is used. Paris Green being an arsenate kills very rapidly, but it is the most easily washed off, of the well known poisons. Where we tested it on the Experimental Farm against arsenate of lead, arsenate of lime, and arsenoid we found that the Paris Green field was the only one on which we had to maek a second application in order to control potato beetles. Paris Green has two disadvantages, one is its high cost, and the other its poor sticking qualities.

Arsenite of Zinc

This is a comparatively new product which has made great headway in some potato sections. Its cost is rather high when compared with arsenate of lime. It should be used at the rate of 2½ pounds to an 80 gallon sprayer. The sticking and killing qualities of arsenite of zinc leave nothing to be desired.

Arsenate of Soda

This material has been known to you for a long time under the name of Arsenoid. Lately it has been offered by another firm under the name of Sol Arsate. Last year several firms were selling both crystal and fused arsenate of soda in the State of Maine. You all know that Arsenate of Soda must be used only when in combination with Bordeaux, and must never be used straight. It kills rapidly, and is safe, and sticks well when used with Bordeaux. Arsenate of soda has the disadvantage of being very unpleasant to the men engaged in its manufacture. Labourers are just now able to pick their jobs as well as dictate wages and hours, and on this account arsenate of soda is now much higher in price than it should be.

Arsenate of Lime

This is a comparatively new poison which is making a place for itself very rapidly. It is now used almost exclusively in the control of the Cotton Boll Weevil in the South, and in a few sections like the Annapolis Valley

they have learned to use it for nearly every purpose.

It is first of all very cheap, costing per unit of arsenic less than any of the poisons that I have mentioned. It is safe in combinations and straight on the potato. It sticks well to the leaves and on this account is more reliable as a poison than Paris Green. Paris Green will kill more rapidly, and when the weather is dry it can be relied upon, but in damp weather arsenate of lime is the more reliable poison. From three to four pounds of arsenate of lime should be used to an 80 gallon sprayer. For the potato grower it is the cheapest and safest of fool proof poisons.

Arsenite of Soda

We have in this material a cheap poison which does not come in the fool proof class. It must be used according to directions or trouble will result. Arsenite of soda is made in New Brunswick and sold in liquid form in glass bottles. We have found that the material is dangerous when combined with lime, but comparatively safe when combined with copper. We have found that arsenite of soda should be poured into the copper sulphate solution and stirred around for some minutes before pouring the solution into the spray tank. The addition of the arsenite of soda to the copper sulphate solution will turn it green in colour. About three pints of saturated arsenite of soda solution should be used to an eighty gallon tank. Never use arsenite of soda excepting in Bordeaux, and add it to the copper sulphate solution before you combine that with the lime solution.

White Arsenic

This material is the base from which all arsenical insecticides are made. It is produced as a by product in the refining of nickel, Cobalt, and other ores, and is by all odds the cheapest form of arsenic. Since arsenicals were first used in the control of insects, attempts have been made to utilize white arsenic as a spraying or dusting material. In most cases severe burning of the foliage resulted, but occasionally the user got good results in insect control, and no injury. In no case was any experimenter able to get similar results over a series of experiments or over a period of years. It was evident that the experimenters did not understand the reactions involved between white arsenic and Bordeaux, consequently they could not control the reactions.

Under instructions from the late Dominion Entomologist, Dr. C. Gordon Hewitt, we started, as many others before us had started, investigations with a view to finding a means of using white arsenic in place of some of the more expensive arsenicals in Bordeaux for the potato.

The advantages of white arsenic over other arsenicals are:—

1. Its low cost, varying from one fifth to one tenth per unit of arsenic over other arsenicals.
2. Its concentrated form being twice as concentrated as Paris Green, which is the most concentrated of manufactured or combined arsenicals.

The disadvantages that we had to overcome were:

1. The difficulty with which it mixes with water.
2. Its poor physical condition.
3. Its low killing value (reported by some.)
4. Its caustic action on foliage.

It took three years of experimenting to overcome all of these disadvantages, but we were able last year to use white arsenic successfully and without a trace of injury in a number of field plots.

The difficulty with which white arsenic mixed with water was overcome by mixing it with an equal quantity of hydrated lime before adding it to the water. Its poor physical condition was corrected by having the material ground more finely. Its low killing value was corrected by the addition of lime and its caustic action on foliage was corrected by adding the white arsenic in such a manner as to cause it to combine with the copper of the copper sulphate, and not with the lime.

Our formula for using white arsenic is as follows:—

To each ten gallons of water intended for a copper sulphate stock solution, add two pounds of a mixture consisting of one pounds of white arsenic and one pound of hydrated lime. After the white arsenic and hydrated lime has been stirred in, suspend in the water a bag containing ten pounds of coarse crystal copper sulphate. Stir occasionally during the twenty-four hours, which it takes for the copper sulphate to dissolve. This stock solution will be green in colour. Use it just as you would any other stock solution of copper sulphate or bluestone, and add the usual quantity of lime in making the Bordeaux. It took Mr. Kelsall, our chemist, and myself three years to understand all of the reactions and get this formula down to a working farm basis. Mr. A. A. H. Margison used it last year on his own farm, and he told me that it cost him six cents per acre for poison on his first application of spray, six cents per acre for the second application, and eight cents per acre for the third application, or a total of twenty cents per acre for poison for the season. That, of course, does not include the cost of copper sulphate, and lime. The big advantage of the white arsenic formula is its low cost. One pound of white arsenic is twice as strong as two pounds of Paris Green, and costs per content of arsenic about one tenth as much. A man can buy his white arsenic, copper sulphate, and lime for a complete poisoned Bordeaux for less than he can buy Paris Green for the same area. When we consider that Canada uses about one million dollars worth of Paris Green annually you can see that this formula may easily save the country several hundred thousand dollars per year. We are intending to demonstrate this formula in a number of places in New Brunswick this year. Mr. M. A. McLeod is working with the District Representatives of the Provincial Department of Agriculture, and they will each conduct demonstrations of the white arsenic formula in various places in their respective territories. If you want to save money on your spray bill, get in touch with your District Representative and watch the demonstrations that he carries on in your locality next season.

I have already over run my time or I would tell you of the new copper-arsenic dust that we are developing, and the duster that we are having built for treating potatoes. We hope within two years to have this dust and dusting machine so that we can recommend it to potato growers. This would mean eliminating water and instead of spraying ten acres per day you could get machines that would dust over two hundred acres per day.

In closing, gentlemen, I wish to express our appreciation of the assistance that we have received from your New Brunswick officials. Mr. W. W. Hubbard, Mr. A. G. Turney and Mr. M. A McLeod, in extending our insecticide work in the Province. This work began to bear fruit last year in lower priced insecticides to you, and we are quite sure that, we can, by working together, show you where you can make infinitely greater savings in the future.

BEAN ANTHRACNOSE

By G. C. Cunningham, B.S.A., Officer in charge Field Laboratory, of Plant Pathology, Fredericton, N. B.

Bean anthracnose, sometimes called pod spot, and incorrectly called rust, is a very common and destructive disease, particularly in Quebec and the Maritime Provinces and, some years, in Ontario. It is almost invariably present but not always severe enough to be noticeable. It attacks the stem, leaves, pods and seeds, causing dark spots, resulting in greatly decreased yields and an inferior quality of crop. It is caused by a microscopic fungus, carried chiefly by the seed. It can be greatly reduced, if not controlled, by taking proper precautions.

Symptoms

Field Appearance:—When infected seed has been planted and the weather is wet or cloudy, the disease develops rapidly. Skips or vacant spaces in the row where the seed has failed to germinate or where the young plants have died and complete disappeared. Freqeuntly considerable portions of the row may be marked only by bare stalks, or small, sickly plants bearing a few faded leaves.

However, an abundance of foliage does not necessarily mean freedom from anthracnoses. Infection under favourable climatic conditions may spread rapidly and become serious even after the plants are quite large; under such conditions it is not noticeable without carefully examining the stem, leaves and pods.

On the Seed: The seed may be slightly or badly infected and in severe cases appears rotted or weathered. Slightly infected seed may show little or no discolouration or only a light brown stain. Badly infected seed shows well marked, dark brown or black spots varying from the size of a pin head to a degree where the whole seed is involved. In such cases the seed coat is usually ruptured and the spots more or less sunken, with a grayish centre, indicating that the invading fungus is producing fruiting bodies. Badly infected beans are unfit for table consumption and even the slightest spot injures the bean for seed purposes.

On the Cotyledons (fleshy seed leaves): Diseased seed invariably produces diseased cotyledons; one or both may be affected. The lesion or canker is of a brownish colour with a definite outline and involving all or part of the cotyledon. If damp weather prevails the diseased area enlarges and the pink spore-masses of the fungus are produced in abundance.

On the Stem: The fungus may spread from the cotyledon to the stem, infecting and destroying the growing point, leaving a bare stalk. If the stem infection takes place early and conditions are favourable, the stem may rot off at the surface of the ground and disappear entirely. Infected stems show well-marked, brown or black, elongated streaks. Severe stem infection practically prevents the plant from setting any pods.

On the Leaves: The disease appears on the lower side of the leaves as black streaks on the mid-rib and veins. This condition sometimes results in a puckering of the surface. The leaves, particularly when the petiols are affected, turn yellow and fall prematurely, leaving small, weak plants incapable of producing a maximum crop.

On the Pods: The lesions are most noticeable on the pods, at first as minute, dark-red spots, which rapidly enlarge and become sunken or saucer-shaped, with a definite dark-red or black border. The sunken appearance disappears as the pods become mature and dry. In other cases, when infection has been extensive, the numerous small lesions coalesce, giving the pods a brownish, black-pitted appearance. The centre of the larger spots may be brown, black, pink or grey, depending on the age-condition of the fungus.

Casual Organism

Bean anthracnose is caused by the fungus Colletotrichum Lindemuthianum Sacc. and Magn. The vegetative mycelium consists of hair-like tubes, at first colourless but later brown; invisible to the unaided eye except in clusters or tufts such as are sometimes seen in the centre of old lesions. A net-work of this mycelium develops beneath the epidermis of the infected spot causing the characteristic appearance of the disease, and later produces small erect branches or conidiophores bearing the elliptical or kidney-shaped spores, stuck together by their mucilaginous envelopes. In masses tbe spores are pink or cream-coloured. These spores are scattered by numerous means to other parts of the plant and even considerable distances to other plants. If there is a supply of moisture, they germinate immediately by sending out one or more germ tubes, which enter the healthy tissue, and in turn its mycelium develops, producing a fresh lesion and a new generation of spores.

Life History

The fungus passes the winter in a dormant condition in the seed, in diseased bean refuse, or in the soil, but chiefly in the seed. The bean seed upon germination is pushed above the ground, both halves forming the cotyledons or rudimentary leaves, which serve as a primary source of food during germination and until the plant has become established. Consequently, infected seed invariably produces infected cotyledons. The moisture taken up by he seed during germination is sufficient to enable the fungus to commence growth and produce spores. These spores are brushed off on the soil as the cotyledons push toward the surface, and immediately come in contact with the young tender stem, ready to germinate and attack the new plant. The cotyledons remain on the stem for a considerable period, after the true leaves have appeared and, if weather conditions are favourable, such as plenty of moisture, and not too much sunlight, the spores are produced in large numbers from diseased cotyledons. These are washed down the stem by rain and spread by other means to all parts of the plant and adjacent plants. The cotyledons thus serve as the nest, in which is produced the new generation of spores and from which they can most easily be spread.

These spores now attack the leaves and stem, setting up disease and weakening the plants. By the time the pods are setting, more spores have been produced from these new lesions and the pods become infected. The fungus mycelium attacks and penetrates the pods causing serious injury and finally enters the new crop of seed in which it lives in a dormant condition until germination takes place the following spring.

The fungus is also capable of wintering over in diseased stems, old pods and leaves, and if these are applied to the soil the new crop infection will take place. Probably it is capable of living on organic matter in the soil for a few years and, if a reasonable rotation is not practised, infection

Notes From the Nova Scotia Agricultural College

POTATO GROWING CONTEST

Below will be found an outline of the arrangements and conditions of a potato growng contest announced last fall for the Western Counties of Nova Scotia.

The contest is being put on by the Provincial Department of Agriculture in conjunction with the management of the Dominion Atlantic Railway. The object of the contest is to increase the production of potatoes, and especally the conservation of the crps planted, by spraying for the prevention of blight and subsequent rot. Every farmer entering his field must agree to spray with Bordeaux Mixture or some equally effective preventive not less than four times during the season.

Great interest is being manifested in the contest by the districts where it applies. Mr. Comeau, General Freight Agent of the D. A. Railway, received last week from Meteghan and vicinity alone no less than twenty-four entries. If other parts of Western Nova Scotia respond as well as this district the contest wll be a big success. In any case there is every indication that there will be a big increase of potato spraying in Nova Scotia during next summer.

In this connection it is well worth while to keep in mind the losses suffered last season through rot. It is estimated that between 2,000,0000 and 3,000,000 bushels were lost, valued anywhere from $2,000,000 to $5,000,000. The greater portion of this loss by far could have been precented by the use of Bordeaux Mixture. If any potato grower is still in doubt as to methods and materials for spraying, the Department of Agriculture at Truro, will be pleased to furnish full information on application.

Contest

Preliminiary to other measures which it is contemplated to adopt for the purpose of assisting the future development of Agriculture in Western Nova Scotia, the Dominion Atlantic Railway Management and the Nova Scotia Department of Agrculture announce:

Prizes will be given for the best acre of potatoes grown in that part of Nova Scotia lying in proximity to the Dominion Atlantic Railway commencing West of the Town of Annapolis and continuing to and including the Municipality of Yarmouth. For the purpose of this contest, the country will be divided as follows:

Division A.—West Annapolis and the Municipality of Digby.

Division B.—The Municipality of Clare.

Division C.—The Municipality of Yarmouth.

Divsion A.

1st Prize	$25.00
2nd Prize	20.00
3rd Prize	15.00

and 9 additiona prizes of an average value of $10.00 each, to be divided on the basis of the scores made by the judges, to the next highest competitors.

Divisions B. and C.

1st Prize	$25.00
2nd Prize	20.00
3rd Prize	15.00

and 7 additional prizes of an average value of $10.00 each, to be divided on the basis of the scores made by the judges, among the seven next highest competitors.

Conditions

Entries for this contest must be made with the Secretary for Agriculture, Truro, or the General Freight Agent of the D. A. R., Halifax, prior to May 31st, 1920.

The minimum size of field for which entry will be accepted must be one acre but this need not necessarily be in one single plot.

Every field entered for this competition must be sprayed with Bordeaux Mixture to prevent blight and subsequent rot, not less than four times. An approved dust, that wil control the development of blght, will be accepted instead of the liquid spray.

The most important points that will be considered in judging this contest will be the yield per acre of marketable potatoes, freedom from rot and evidence of the best methods of cultivation during the growing period.

Arrangements are being made to place an experienced man in the above territory t oco-operate with the farmers as to the best methods for general development, spraying, cow testing, etc.

F. G. J. COMEAU,
Gen. Freight Agent, D.A.R.
Halifax, N. S.

M. CUMMING,
Sec'y for Agriculture,
Truro, N. S.

THE SILO

At the present high prices for milk and its products Dairy farming would be a veritable gold mine in Nova Scotia were it not for the corresponding- and there regarded as one of the worst foes of the apple, has made its appearance in Nova Scotia. The Entomological Department will take up the investigation of its habits and life hsitory, and conduct extensive experiments in methods of control. The insect has wrought havoc in England, Germany, Central Russia and Northern Japan.

In adddition to this problem, Prof. Brittain expects to do a great deal in the way of general experimental work in orchard spraying and dusting. Further information regarding results will be published from time to time. In the vegetable line, the redoubtable Cabbage worm will claim considerable attention, and some untested remedies will be tried out.

A Counter Blast

In a letter dated March 13th., George F. Chipman, editor of the Grain Growers' Guide, took exception to statements made in an article published in the Maritime Farmer, on March 2nd, and made an offer of $1,000 payable to the Maritime Farmer, if it could prove any one of its statements. The trick is an old one. The Maritime Farmer claims that its statements are correct, and that the One Thousand dollars Is not only due this paper, but it makes this proposition to Mr. Chipman;

The Maritime Farmer will pay to Prof. Cumming, Truro, for prizes to be awarded to any students of the Nova Scotia College, whom the recipient may select, the following amounts;

(1) One hundred dollars if Mr. Chipman will prove his claim that Grain Growers, in asking for Dominion funds to market the western crop of wheat, DO SO TO PREVENT THE PRICE OF WHEAT FROM SOARING AND WHICH POLICY MUST RESULT IN HEAVY FINANCIAL LOSS TO WESTERN FARMERS; if Mr. Chipman's contention is right.

(2) One hundred dollars if Mr. Chipman can offer any sound reason for refraining from asking similar concessions for the produce of the farms of Eastern Canada, notably cheese, which is to be regulated in price on the British market, the retail price being fixed at forty-cents.

(3) One hundred dollars if Mr. Chipman can name one bona-fide farmer from the Maritime Provinces, and domiciled in these provinces, who assisted in the drafting of the New National Policy, which the Maritime Farmer repeats was designed originally for the advantage of the west.

(4) One hundred dollars if Mr. Chipman can prove that the Grain Growers Guide misstated the facts of the case, when in its issue of March 31st, it said, "THE GRAIN GROWERS GUIDE WILL BE THE CHIEF OWNER OF THE NEW PAPER AND IT WILL BE PUBLISHED UNDER THE SAME MANAGEMENT AS THE GRAIN GROWERS GUIDE, WINNIPEG."

(5) One hundred dollars if he can show that the remarks attributed by this paper to Messrs. Wood and Musselman were not published in the leading newspapers of this country, and if a correction of these statements has appeared in the papers so publishing the statements, over the signatures of either of these gentlemen.

If Mr. Chipman is not prpared to win this money, he owes the Maritime Farmer one thousand dollars. We do not want the money, but we ask that it be paid over to the principal of the Nova Scotia Agricultural college for prizes for the students of that college. In a word, the "BLUFF IS CALLED".

This letter has been sent to the United Farmers Guide as an advertisement.

PROFESSOR W. H. BRITTAIN RETURNS

Professor. W. H. Brittain, Provincial Entomologist, who has been taking post-graduate work at Cornell University, has returned to Truro. He has completed the work for his Master's degree. A big season's work looms up before his Department.

In the line of Fruit protectiоn a new problem appears. The Apple Sucker, a pest imported from Europe, ly high prices of imported feeds. Hugs amounts of money go out of the Province every year for materials to supplement the home grown fodders. This is in part unavoidable. Some concentrated feeds must always be bought in farming areas of the Maritime type.

By good management a very considerable portion of this expenditure could be avoided. Nothing has proven so effective and practical along this line as the growing of oats, peas and vetches, or, as it is commony called the O. P. V. mixture. On good land the yield is very heavy and the crop is a hardy one. In one part of Nova Scotia at least six silos for containing this fodder have been erected during the past two years. In some other parts, where farmers do not grow enough to ensile, the O.P.V. mixture is being grown and used partially as a suplement to the pastures during the dry season. Then, what is over is cured and stored as hay.

Dairy farmers all over Nova Scotia would be well advised in plannng this spring on a arger area of this green forage crop. Those who are unfamiliar with method, returns, etc., would do well to write Prof. J. M. Trueman, Agricultural College, Truro, for full information.

SPLENDID RECORD MADE BY DAM OF HOLSTEIN BULL AT TRURO

The College Management are highly pleased with the official record made by Trenton Keyes Hermes, dam o the Holstein bull selected to head the Holstein herd at the College. In her three-year-old form she has produced 30.7 lbs. of buttef in her February test. This was the highest record made by any three-year-old in Canada during that month.

This College herd sire is also royally bred on the male side, being a son of Pontiac Korndyke Het Loo, sire of the Canadian Champion heifer, Het Loo Pieterja, which sold for the record price of $12,750.

Since the above was written word has been received of a new record made by this dam, viz., Trenton Keyes Hermes. In a 60 days test she produced 5,621 lbs. milk, yielding 244.30 lbs. butter. This means over 90 lbs. milk per day, and a fraction over 4 lbs. of butter.

NITRO-CULTURES

For years pas the Nova Scotia Agricultural College has distributed nitro-cultures among farmers to encourage the growing of the various leguminous crops, such as Alfalfa, Sweet clover, Red clover, Alsike, Peas, Bean, etc. These are cultures of the bacteria which produce nodules on the roots of this class of plants, and extract nitrogen from the air to enrich not only the plant, but also the the soil in this highest priced of all fertilizing ingredients.

This year the N. S. Departmet of Agriculture has arranged with the Division of Botany, Central Experimental Farm at Ottawa, to make and send these cultures. Farmers who have had difficuty in obtaining a good stand of any of these all-important crops are strongly recommended to make a trial treatment. The cultures are supplied free of charge on application, to farmers who will write stating for what crop the culture is required and the quantity of seeds they wish to have treated. Not more than three bottles, each containing sufficient to innoculate 60 lbs. of seed, will be furnished to one applicant. Write to the Division of Botany, Ottawa, stating your needs.

CO-OPERATIVE MARKETING OF WOOL

Plans have ben completed for the continuance of the Co-operative marketing of wool in the Province of Nova Scotia, under the management of the Canadian Co-operative Wool Growers, Ltd., of Toronto.

Nova Scotia sheep raisers who marketed their wool through this orangization last year realized on the average about 40% more than those who sold in the ordinary way. There is

Cutting Seed Potatoes

By E. V. Hardenburg, Potato Specialist, Cornell University

With the possible exception of variety tests and fertilizer experiments, no other phase of potato production has received so much experimental attention as the question of type of seed piece. Nearly every state experiment station in the United States has at some time conducted exeprinents to test the relative influence on yield of

(1) large versus small tubers for seed;

(2) whole versus cut seed;

(3) large versus small seed pieces; or

(4) number of eyes.

A review of the literature on the results of these tests leads to much difficulty in drawing definite conclusions as to the real influence of each of these factors because in a majority of the tests one or more of the factors has been confused with the one intended for study.

In nearly all of the experiments to date, the all important factor, amount of seed per acre, has been neglected. This has led to false conclusions and a mass of published data of questionable value. To illustrate, in tests comparing the influence on yield of whole, half, quarter and eighth tubers, the results have generally favored the whole tuber for seed and it has been concluded that the larger the seed piece planted, the greater the yield is likely to be. In reality eight times as much seed is used on an acre when whole seed is plantel as is consumed when eighth tubers are planted. If grain were used instead of potatoes the credit would be given to difference in amount of seed planted per unit of acre. Most of these experiments have theerfore, in reality not shown that whole tubers are to be preferred to eighth tubers provided the eighth tubers are planted enough closer in the row to consume the same amount of seed per acre as would be used in case whole tubers were planted.

Large versus Small Whole Tubers for Seed

Three factors are principally concerned with the size of tuber which is used by a given grower or a given locality namely,

(1) prevailing cost of seed;

(2) prevailing standard of quality in the mind of the grower;

(3) type of seed stock available.

To the writer, it appears that of these three, the estimated relative value of large versus small tubers is probably the controlling factor in the mind of the grower. More small whole seed is used in southern New York than in any other potato section of the state. Here the standard of excellence is lower than in other regions. Certainly small seed is not used on account of high priced goods because relatively lower prices prevail in this than in other sections.

Adams of Wisconsin, Aicher and Welch of Idaho, Plumb of Tennessee and Zavitz of Ontario are among the experimenters who in years back have compared the influence of large versus small tubers for seed on yield. They all found that the gross yield increased as the size of tuber used increased. In most cases the marketable yield also increased with size of tuber used. In a few instances, owing to the increase in number of stalks per hill as size of tuber increased, the marketable yield was not greatest from the largest seed tubers. In all these tests, same spacing of hills was used for each type of seed. It must be concluded from these tests therefore, that large whole seed is better than small whole seed under equidistance of planting only because of the greater weight of seed used.

Whole versus Cut Seed

The question of whether or not to cut seed potatoes depends upon three factors, namely,

(1) cost of labor;

(2) cost of seed; and

(3) the relative yield from whole versus cut seed.

Inasmuch as a man will normally cut only about twenty bushels of seed in a ten hour day, the labor cost of cutting is of some account in determining whether to cut seed. Again with potatoes selling at fifty cents or less a bushel, it becomes somewhat of a question whether average sized potatoes should be cut at all. Experimental literature deals only with the third factor above mentioned.

Cutting a seed tuber at once allows of loss of cell sap by bleeding and permits the entrance of rot producing soil fungi and bacteria. On the other hand, Appleman of the Maryland Station has shown a distinct advantage from cutting. Whereas whole tubers planted or germinated above ground normally develop only the sprouts near the apical or seed end, by cutting such tubers, both medium and basal end eyes may be made to grow. Briefly. Appleman has shown that anything which will facilitate the entrance of oxygen into the tuber will enhance growth phenomena which on account of the skin a suberized condition of the tuber would otherwise remain dormant for an indefinite period. This indicates a more economical use of seed potatoes than that of planting them whole.

Aicher and Welch at the Idaho Station made a three year comparison of whole and cut seed and while obtaining a greater total yield from whole seed, the marketable yield in all cases was greatest from the cut seed. These tests are not a true criterion of the relative value of whole and cut seed, however, as far more seed per acre was used in the case of whole seed. Many years ago, the Tennessee Experiment Station tested the comparative yields from whole seed and from an equal weight of half tubers taken from the same lot of seed. Nearly two and one-half times as much marketable yield came from the half tubers, but owing to the fact that the halves were planted on twice as much area, the comparison is of little value. The best test of this question was made by the New York Station when equal weight seed pieces of whole and cut tubers were used per acre. Whereas about equal total yield was obtained from the cut and whole seed, the marketable yield from cut seed was nearly double that from whole seed. Apparently with equal rates of planting cut seed is the more economical to use.

Large versus Small Seed Pieces

Probably, the easiest, most interesting and most frequently conducted seed potato experiment is that testing the influence of size of seed piece on yield. Nearly all our State experiment stations have published the results of such tests. The basis of size has been both by weight and by proportion of tuber. In these as in the experiments previously cited, the usual increase in yield has been accredited to the larger seed rather than to the increased amount per acre used. As a result, it is commonly concluded that the larger the seed piece used, the greater the yield. Under equidistance of spacing this conclusion may express the truth. But these tests are in reality tests of rate of planting rather than size of seed piece. Notable exceptions to this criticism are the experiments of Emerson of Nebraska and Zavitz of Ontario. Emerson planted eighth, quarter and half tuber pieces 6, 12 and 24 inches apart respectively, this using eighteen bushels per acre in each case. This gave him greatest total yield per acre from the quarter tuber and lowest total yield from the half tuber, a result warranting a conclusion quite contrary to that drawn from the other tests cited above. Zavitz compared yields from one and two ounce pieces, the one ounce pieces being planted twice as close in the row as the two ounce pieces, thus consuming the same weight per acre of seed. Here also the greatest total marketable and net yield came from the one ounce pieces. We may conclude from these two tests, therefore, that with the same rate of planting, smaller pieces down to one ounce planted closer are likely to give larger yields than larger pieces planted further apart. These data should not, however, influence the grower whose system of spacing seed may be justified, to cut his seed smaller than the two ounce or hen's egg size.

Number of Eyes

Many of our older and experienced potato growers stress the importance of cutting seed pieces to a certain number of eyes. The so-called proper number may be one, two or three depending on the personal taste of the grower. With constant weight of seed piece, the average number of eyes to the piece naturally depends upon the type or pariety of potato concerned. Most farieties of the Rose, Burbank and Hebron types contain many eyes while varieties of the Rural and Pearl groups normally have few eyes. Ballou

HON. DR. ALEXANDER CAMPBELL, F. R. C. S.
Minister of Agriculture & Mines for the Dominion of Newfoundland

Hon. Dr. Alexander Campbell was born at Souris, P. E. Island 43 years ago, was educated at Prince of Wales, Charlottetown, from which he graduated with hinors and later taught school for five years in his native town. He entered McGill for Medicine from which University he graduated in 1902, having had an exceptional career of honors during his course. On the advice of Sir Thomas Rodderick, Dean for the Medical Faculty, he went to Newfoundland to enter upon the practice of his profession, and after two very successful years in country practice he removed to the Capital, St. John's, where he rapidly came to the front as one of Newfoundlands leading physicians. He is connected with all the Hospital life of the City and for 10 years was Quarantine Physician for the Dominion, which position he resigned last August to enter the political arena.

In 1910 he further pursued his Medical Studies at Edinborough University, where he was made a Fellow of the Royal College of Surgeons, heading the list in a big field of competitors from all over the world; later he pursued his studies at Berlin and Vienna Universities.

When Hon. R. A. Squires formed his party in August, 1919, Dr. Campbell became one of his most active and energetic organizers. He was a colleague of Premier Squires in the District of St. John's West, and is at present a Member of the Legislature Council. He is one of Premier Squires Cabinet Ministers with the portfolio of Agriculture & Mines.

He has the reputation in Newfoundland of being a powerful platform speaker and a very astute organizer.

NOVA SCOTIA FARMERS WILL NOT BE STAMPEDED

Nova Scotia farmers have taken a commendable stand in not allowing any organization to put one over on them. Following is a resolution recently passed by a group of intelligent farmers at Truro, as reported by the Truro Citizen:

Any political arrangement between the Independent Labor Party of this province and the United Farmers of Nova Scotia is some distance in the future and prospects are not bright for its consumation at all.

The matter was considered Wednesday night at Academy Hall when representatives of the Labor party appeared before the United Farmers and asked that some arrangement be made. Although J. J. Morrison, secretary of the United Farmers of Ontario, made a speech in favor of the arrangement being arrived at, the convention was not ready to endorse the plan and voted to refer it to the executive officers to deal with later.

Three speakers appeared to present the labor party's case. They were A. R. Richardson, Sydney; J. S. Wallace, Halifax, secretary of the party; and Dan D. McDonald, of Sydney Mines.

Before the labor representatives presented their case the convention condemned the 8 hour day in a resolution that passed almost unanimously, only seven or eight voting against.

The passing of this resolution apparently closed any avenue of approach between the parties. Richardson told the farmers it was no more possible to fight the 8-hour day successfully than to stop the sun. Prescott Blanchard, Truro, claimed it was impossible for farmers to operate on an 8-hour day and said: "What is the good of talking about an impossibility?" Other delegates said the 8-hour day was impossible in haying time and at apple picking time.

J. S. Wallace, Secretary of the Labor party, told the farmers he was going to give them something to think about. He was plainly sore at the passing of the resolution against the 8-hour day and his address was not of a concilatory nature. Frequently he was interrupted, the audience not taking very kindly to his line of talk. The resolution against the 8-hour day, he declared, was a wedge driven between the parties. "How can you get the government," he asked, "unless you unite with labor in the cities? You have killed your chances," he added. "We held out our hand; what did you do? You said work a couple of hours longer. Ontario farmers joined hands with labor. Are you too good?" Referring to the Labor proposal for a political arrangement, he said: "They have extended their hand; are you going to slap them in the face?"

The resolution against the 8-hour day was as follows:

"Wheras, one of the great burdens of the present day is the steadily increasing cost of living; and

"Whreas, it bears as heavily on the farmers as any other profession in everything they have to buy for themselves, their farms and their families; and

"Whereas, the farmers are opposed to anything that will further raise the cost of living; and

"Whereas, any shortening of the workng day is bound to react in increased cost of living;

"Be it therefore resolved that the Nova Scotia United Farmers here assembled protest in the strongest manner against the eight hour day, as it will at once increase the cost of everything grown, manufactured, sold or in any way produced twenty-five per cent."

FARMERS AND THE H. C. L.

The farmers of Canada did their part nobly and well in the days that our country was at war. Their efforts backed our boys so that they were able to carry on and win the day. The farmers of Canada are today the sanest class of aborers we have in the country, despite the fact that many of them are laboring under diffiiculties that are almost unsurmountable. Our farmers are conscious of the fact that there is a short world supply of food reserves.

Dr. J. W. Robertson, than whom there is no closer student of economic conditions, declares that the only way to remedy conditions is for the farmers to produce more. He says: "The high cost of living is more than an economic or political phrase, it is a grim reality which is being felt by millions of people."

While increased production can no longer be urged as a necessity of war, every man who has had an opportunity of learning the facts and studying the situation is convinced that increased production is a necessity of peace."

The farmers of Canada will continue to produce even when working against tremendous odds. They will spare neither brain, brawn nor time to do their part. The hand writing is, howver, on the wall. The worm may turn. It will be a sorry day for Canada when her farmers cease to toil to the devotees of other industries who persist in clamoring for unreasonably short hours and more money for less production. We say, beware! If the farmer is going to produce abundantly in order to help reduce the H. C. L. it is up to artisans in other calling to do the same. It cannot be done in an eight-hour day.

BE NOT YOKED UNEVENLY TOGETHER

The farmers of Nova Scotia are not ready to work hand in hand with any class that tends to lessen production by agitating for shorter hours. The advocates of this six to eight hour day got their answer at Truro a few weks ago. Those who are fooling with daylight saving should receive a similar answer. The sooner the fact seeps in that it is absolutey impossible to conduct farm operation on an eight-hour basis, the better for the consuming class. Hired help on the farm will not work later than neighbors in the shops, no matter at what hour they commence. Animals function in regular order, and to realize the most, there must be regularity in hours of milking, feeding and care. Crops cannot be worked when the dew is on and where daylight saving hours are practiced there is an enforced idleness.

Dr. Twitchell summed up the inevitable result when he said in the columns of the Maine Farmer a few weeks ago: "When the day comes, as come it will, when the shortage of food is felt, it will be well for those who have catered to the demand for shorter hours, greatly increased wages, and daylight saving, to bear in mind that they are responsible for whatever may arise.

"It is easy now for them to sit in their comfortable easy chairs and talk about "the lazy, indolent, shiftless farmers," but they will perhaps some day realize that what they have attempted for their own pleasure and gratification, is bringing home the inevitable harvest.

"You cannot successfully conduct farm operations on eight hours a day, six dollars a day, or by setting clocks ahead an hour."

The greatest problem before the farmers today was well stated by a man at a farmers' meeting recently when he said: "It is not so much the growing of two blades of grass where one grew befor, but to get the proper compensation for growing the one or two blades, as the case may be." In other words, the problem is economic rather than scientific.

REAL CASH

"If you send foreign coins and do not hear from your order, remember we are holding same for remittance of real cash. We will return your former remittance when postage is sent for same. Do not send Canadian dimes?" How does the foregoing from the columns of one of our American exchanges sound to ur readers? It is fully time that Canadians patronize home industies, build up our own towns and cities and create a better market for our produce.

* * *

The selfishness of organized bodies, whether labor or trade, shows itsef in increasing force, year by year. No wonder the producers of food are growing sensitive, conscious of the power which assumes to dictate whenever they go to market and demand so large a per cent. of the income from farm products.

* * *

Why don't some of the smart town fellows shut up their shops and go farming and get some of the easy money, and incidentally raise something to feed a starving world.

* * *

Difficult to get and expensive labor is driving many farmers to the point where they must curtail their operations. In out own vicinity there is a sale of farmers effects and live stock nearly every day. The farmers say: "A hungry world can go to work or starve as far as we care. We need a class of leaders who will not let this Dominion be dominated by Socialistic labor unions."

The Co-Operative Marketing of Wool, 1920

Co-operative Marketing of Wool Means

1. That wool is graded according to quality and paid for on the same basis.

2. All wool is accumulated at a central point where the grading is done.

3. The grading is done by experts supplied by the Sheep and Goat Division. Department of Agriculture, Ottawa.

4. The Co-operative Association sells the wool direct to the ultimate buyer, the manufacturer. Equal advantages are extended to both the small and large sheep raiser.

5. The wool is taken direct from the sheep, not tub washed. Why? Because the mills divide a fleece into parts according to quality and length, each part being used for a certain purpose. This separation cannot be made with tub washed wool.

The Advantages to be Derived

The advantages are of a financial and educational nature.

1. A large amount of graded wool at one point attracts the attention of the largest buyers—the woolen manufacturers.

2. Organized selling considerably reduces the over head expenses which have to be borne by the producer.

3. The producer receives more for his wool. Under the old system of selling, this difference went to the country peddlers and wool dealers as their profits and expenses. Co-operative marketing means the elimination of several middlemen.

4. Outside competition forces local buyers to pay a higher price.

5. The flat rate of so much a pound, irrespective of quality, is displaced. The wool grower with clean dry wool will receive a premium for his trouble.

6. The wool grower learns market requirements. He learns the value of good wool and consequently strives to produce same.

7. It leads to a greater interest in the sheep industry and to a better quality of wool being produced.

8. Co-operative marekting of wool is the beginning and will lead to co-operation along other lines.

History of Co-operative Wool Sales in Canada

Wool was first marekted co-operatively in Canada in 1914, when this work was conducted by the Sheep and Goat Division, Department of Agriculture, Ottawa. 206,129 pounds were handled that year. The amount has increased each year and 3,800,303 pounds were marketed last year in this co-operative manner. This work was under the direct supervision of the Federal Department of Agriculture until 1918, when the Canadian Co-operative Wool Growers, Ltd., with head office at Toronto, was formed. This is an organized body of wool growers working co-operatively, and every man connected with this company is a wool grower. The leading sheepmen of Canada are shareholders of this company. The Federal and Provincial Departments of Agriculture are co-operating in the work.

Co-operative Wool Sales in New Brunswick

The first attempt to market wool co-operatively in New Brunswick was made by the Sussex and Studholm Wool Growers Association in 1916, when they marketed over 5,000 pounds and received a price greatly in excess of what was received for wool sold locally.

In 1918 the New Brunswick Department of Agriculture made an effort to get the New Brunswick wool growers to market their wool clip in this progressive manner. The effort proved a success and the work was continued in 1919.

The growth of the co-operative wool marketing business in the Province is indicated by the following table showing the amounts of the various grades handled in each of the two years in which this plan was followed:

Grade	Amt. Handled in 1918	Amt. Handled in 1919	Net Price to Farmer 1918	Net Price to Farmer 1919
Clothing	50	.....	.81¾	....
Fine Med. Clothing	1,778	.....	.82½	....
Medium Combing	18,602	24,550	.81¾	.67
Medium Clothing	39	.....	.79	....
Low Combing	.....	1,092	....	.49
Low Med. Combing	9,502	28,127	.75½	.62
Coarse	691	334	.69½	.42
Cotts	.....	230	....	.26
Rejects	403.5	27	.42	.29
Grey and Black	367.5	842	.50	.39

Plans of the New Brunswick Department of Agriculture for the Marketing of the 1920 Wool Crop Co-operatively

1. Wool will be shipped into Fredericton where the wool warehouse and grading station is located.

2. The Secretary of the Agricultural Society will be the medium through which all correspondence will be transacted.

3. Where no Agricultural Society exists, the business in connection will be conducted by individual sheep raisers.

4. Whether the business is handled by Agricultural Societies or not, the sacks, twine and tags will be shipped to one man in a district who will distribute them. (By shipping thus, the expenses are greatly reduced as 10 sacks may be shipped, in one bundle, almost as cheaply as 1 sack).

5. Ship wool to Fredericton, collect, by the cheapest and shortest route and write the Live Stock Division, Department of Agriculture, Fredericton, on the day of shipment, enclosing Bill of Lading or Shipping Receipt.

6. When wool arrives at the Wool Warehouse it is weighed on tested scales and a cheque sent to the owner for 80 per cent. of the prevailing market price. (Boston market). Based on the past two years results, this 80 per cent. would approximate what local buyers are paying in full.

7. Cheque for balance will be sent when wool is graded and sold. (This should be inside of 3 months).

Detach, fill in and return the following application form at an early date. All applications to be in not later than May 15th.

Application Form for Marketing Wool Co-operatively

I hereby make application to sell my wool co-operatively through the medium of the New Brunswick Department of Agriculture and the Canadian Co-operative Wool Growers, Limited.

Name .....

Post Office Address.....

Railway Station.....

County .....

Number of fleeces.....

Do you use a wool tying box?.....

N.B.—It is imperative that these forms be properly filled out so that the correct number of sacks and right amount of paper twine may be sent to each grower.

Return application form promptly to F. W. Walsh, Asst. Supt. for Livestock, Department of Agriculture, Fredericton.

Care of Sheep

Select a high class sire

Feed the flock liberally.

Protect from storms and draughts.

Weed out all old and unthrifty individuals.

Dip twice a year—spring and fall—to keep fleece clean and sheep free from ticks and lice.

Dock and castrate the lambs.

Feed in racks to keep the fleece free from chaff and burrs.

Trim to prevent manure collecting on the hind quarters.

Do not mark sheep with paint or tar.

In breeding operations endeavor to eliminate black sheep from the flock. Black wool brings a lower price.

Preparation of the Wool

1. Have the sheep dry when the shearing is done as damp wool will mildew in storage.

2. Shear on a clean floor. Clean wool means a higher grade.

3. Tags, dung locks and stained pieces should be clipped from the fleece previous to shearing and packed separately.

4. The fleece should be kept as intact as possible in shearing. (This can be accomplished best with a shearing machine.)

5. After the fleece is sheared, turn it over, fold in the sides and rough ends and roll compactly from tail to head with the bright or clipped surface outward.

6. Tie each fleece separately using pape rtwine, which will be supplied. Never use sisal or binder twine.

7. Wool should be packed in standard wool sacks. These will be supplied to anyone having 8 or more fleeces. Sheep owners who have less than 8 fleeces to dispose of can use ordinary feed sacks. Care should be taken to have these sacks clean.

8. Special shipping tags will also be supplied. These should be filled out carefully and to prevent any trouble in transit use 2 tags with each sack, one inside and one outside.

If you never marketed your wool in this manner, make an effort to do so this year. Ask some sheep man who tried it last year what he thinks about it. They are all satisfied patrons.

Why not get the top price for your wool?

Remember the more marketed in this way the less will be the handling charges per pound, therefore get your neighbor interested.

If you have an Agricultural Society in your district talk it over with the officers and other members. If there is no Society, get a few of your neighbors interested and write us for further particulars. If no one else is interested but yourself, make application to sell your own wool anyway.

The sheep owners who marketed their wool co-operatively last year received an average of 62.7c per pound for unwashed wool. What did you receive for yours?

Study this article carefully.

The Use of Nitro Cultures

(Experimental Farms Note.)

In the report of the Dominion Botanist for the year ending March 31, 1915, he says: "During the last month of the year," viz., December, 1914—"it was deemed advisavle for this division to prepare nitro-cultures of alfalfa, red clover and peas for distribution to the branch Farms."

Such was the genesis of the present system of free distribution of nitrocutures to farmers, begun in the following season of 1916, and now entering its fifth year.

The branch Farms, by their example and reports, and the ocular demonstration to visitors given in the condition of their leguminous crops, started the demand of the farming public for these cultures, which it is our endeavor to stimulate, guide aright, and, to the best of our capacity, satisfy.

For the benefit of those farmers, who have not yet studied this question, we propose to briefly explain the term "nitro-culture."

Since the time of the Romans it has been known that the introduction into a crop rotation of a legume—that is, one of the plants belonging to the family Leguminosae, of which the most important members from the farming view point are clovers, peas, beans and vetches—somehow or other greatly benefited other subsequent crops. tI is only within the last few years that the explanation has been discovered.

The Legumes, as a family in the vegetable kingdom, generally bear on their orotlets small nodules or lumps, of the size of a pin head upwards. Microscopic sttudy has shown that these nodules contain numerous small organisms, wnown as bacteria. These organisms belong to a particular group with a number of definite strains, each strain apparently confining itself to a particular plant or group of plants. A long series of subsequent experimenting has proved that these bacteria convert the nitrogen of the air into a chemical form which the plant or group of palnts can readily assimilate. The association, in short, of plant and bacteria, is decidedly beneficial both to the legumes and the soil. The net result, at the end of the season, is a valuable addition of nitrogen to the farmer's field, at, practically, no expense.

Now "nitro-cultures" are simply collections of these bacteria ready bottled. The proper bacteria are isolated from all others, grown on artificial soil, consisting of a jelly made from an oriental seaweed mixed with chemical salts, and then bottled for sending out.

The farmer, when he receives the cultures, breaks up the jelly, shakes it up with some skim milk or sugared water, and wets his seeds with the resulting liquid. This distributes the bacteria over the seeds, which when dry, are sown; and, so, plant and bacteria are brought into intimate contact from the very commencement of growth.

Nitro-cultures are prepared by the Division of Botany for alfalfa and sweet clover, red and asike clovers, and peas, and are put up in bottles containing sufficient bacteria for the treatment of about a bushel (60 lbs.) of seed. Cultures are supplied free to farmers on application to the Division of Botany, Central Experimental Farm, Ottawa, Ont., on their stating the crop for which culture is required, and the quantity of seed proposed to be treated. Only three such bottles in all, however, can be supplied to any one appicant.—R. A. Ingis, Asst. Botanist.

How to Treat Seed Potatoes

By G. H. Coons, Michigan Agr. College

The growing of potatoes will make its best advances when farmers, having confidence in the crop realize that the potato crop is a stable, safe crop which responds in a profitable way to intelligent care and handling. The potato crop may be compared to a dairy herd which, if neglected, yields a poor return and is a losing proposition, but which if cared for and urged to the limit, returns a good profit to its owners. Today, after four years of satisfactory prices, we are at a vantage point and can make this crop a well cared for crop rather than a mediocre one, stunted at every turn.

It is not too much to say that, for years the condition of potato farming in the sandy land districts has been on rather unsound footing. The potato crop had to be grown, it was the sure crop on the newly cleared land and it was a safe crop, so far as yield was concerned, on the sandy land that was becoming more and more acid. It is a known fact that farmers in many of the areas of greatest potato production were planting large acreages and securing from these plantings very low yields, yields far below those of which the ground was capable of producing. The case was simply this—every farmer had the recollection of 25-cent potatoes looming as a specter, and when as one authority stated it cost 22½ cents a bushel to raise potatoes, this figure offered little recompense for hauling potatoes five miles into town. It was a crop which in years of big yield threatened to give but small returns, hence the farmer felt that it was a crop which did not warrant outlay in the way of soil preparation, fertilizer, insect and plant disease control.

In short, the farmer was raising a starved crop, stinting it in every way, and his practices were reflected in the yield. And then, to complete the vicious circle, since he stood to make so little per acre, he had to raise many acres in order to get any sizable amount of money.

It may seem a rather far cry from this discussion of potato growing methods to the subject of this article —methods of seed treatment. But the connection is particularly close and intimate; potato disease control hinges closely upon farm management. It is useless to attempt to persuade farmers to put more and more money into the cost of raising a crop that is not yielding commensurate return.

But in the last four years the potato crop, aside from the slight ups and downs of the market, and aside from the disastrous effects of the tip burn, drought and freezing in some sections has been a crop that has brought such a profit as to gain for itself a new place in the farmer's estimation. Instead o being a crop of low value which has been a drug on the market, it has moved readily, when there were cars and the size was right—and has commanded a price unheard of in the old days.

These conditions have focused attention on the potato crop and every farmer who has had his crop cut in two by drought has done a little mental arithmetic to compute profits on the basis of good yield. And every farmer who has recalled the loss caused by disease has turned this loss into dollars and cents as he figures what from 10 to 25 per cent. shortage on account of disease has cost him. There has been, too, a marked awakening interest in potato growing brought about by the educational extension of the colleges. Such papers as the Potato Magazine, focussing attention on the potato as a worthy crop have been important factors. The combination of many things is therefore bringing about a wholesome niterest in potato crop improvement.

The first step in this program start with the seed. In many articles in previous issues of the Potato Magazine, experts have brought home the importance of sowing seed of uniform strain; of high yielding quality both as to vigor and as to freedom from serious diseases.

This article will not take up the complex matter of seed selection, except to say that good seed of desirable type and of satisfying past history, both in performance and disease-freedom can be had through the extension service of our agricultural colleges. This is a noteworthy advance in good potato produvtion. There are men on the job to locate desirable stocks of seed and to insure that the potato maintains its place as a permanent profitable field crop. This article will deal with seed treatment. its "whys and wherefores" and its "hows."

To reinforce what has been said before, it may be remaarked that in a survey made a few years ago by the Horticultural Department of the Michigan Agricultural College, in which potato growers in one of our largest potato-growing counties were interviewed, only seven were found in several hundred seen who treated their potato seed beore planting. Potato seed treatment seems to be a lost art in this country. This condition reflects a common condition in northern United States. Now it is not thought that potato seed treatment is a new thing for any farmer to try. Probably no potato grower of experience could be found who had not treated his seed more or less spasmodically. It was a farm practice that your father insisted upon way back in 1893. It was a thing whose effectiveness has been demonstrated over and over from 1893 to date; and yet only seven farmers were treating potatoes, so far as could be found, in a survey of the conditions in one of the more important potato producing communities!

Seed treatment consists essentially in soaking seed tubers in a disinfectant solution to rid the seed stock of live germs of the sort that would lead to disease in the crop.

The first treatment advocated years ago by Prof. Boilley, of North Dakota was a 1½ hour soaking in corrosive sublimate solution, 1-1000. This solution is easily made by dissolving four ounces of corrosive sublimate in 30 gallons of water. This treatment became of very wide vogue and in a few years potato seed treatment was an established part of potato growing. With the discovery of the value of formaldehyde as a disinfectant, this chemical after being first recommended for grain treatment was used as a control agency potato scab. It immediately became popular and potato seer treatment was put in practice generally throughout the United States.

The subsequent history of potato seed treatment parellels the story of grain treatment. Here were practices universally understood and tested. No farmer questioned the importance or doubted the profitableness of the operation; but in the rush of farm operations these wholesome methods became overlooked and it took the stern demands of the War emergency and the necessity of farm efficiency to bring home to farmers the need of these conservation measures.

Farmers have noticed another disease besides scab has been doing damage to their crops. This disease is known as Black Scurf or the Rhizoctonia disease. Every farmer has seen the results in the field even if he has not dignified them with a name. In the average field it is a common thing to see rows with hills missing here and there. Later in the season, a weak, laggard growth may come up in these seeming blank places where the mother tuber takes a second growth after the first sprout is killed. The blanks are caused by the attack of the Rhizoctonia fungus on the young sprouts; these "damp off" and the potato has to start a new growth from below the rotted portion.

Again, the farmer has seen the results of this fungus in the giant hills that appear in fields—great, green plants that one would fancy would yield a peck of tubers! When digging time comes, the farmer is sadly disillusioned for these vines yield 20 or 30 small, misshapen tubers, usually green from being formed too close to the surface of the ground. Rhizoctonia has again produced a characteristic effect.

By its attack on the stem it has not completely cut off the shoot from the roots, but it has destroyed the green bark. It is in this green bark that the food to be stored in the tuber is transported from the leaves and with the girdling of the stem the normal tuber formation is impossible. The potato sets its tubers above the girdled place and the resultant yield is the unmarketable product referred to.

Then there is a third form of damage produced by the rhizoctonia. This phase is usually overlooked by the grower—he classified the tubers with Rhizoctonia markings as potatoes with crumbs of dirt upon them. Here is a little task for the farmer about to plant potatoes. Bring out a peck of potatoes and wash them—there will be some "dirt" that won't come off. In the average lot of tubers about 25 percent show the black scurf blemishes. Each of these tubers has dangerous possibilities if used for seed.

The damage done by potato scab is severe enough to warrant treatment for this disease alone. Year in and year out, potato scab makes from 10 to 15 per cent of the potatoes grown unmarketable. There is a high percentage not picked up at all; there are a lot thrown out at the car and then in the market keen buyers insist on allowance for scab in the stock.

With our potato soils tending to become acid as they are used, nature is helping the farmer to keep scab in check. The dangerous source of scab in our sandy lands is not the soil but the seed stock. Clean seed or disinfected seed on soil on which potatoes have not grown for three or four years will give a clean crop.

The grower must recognize that he is seeking to overcome two diseases, principally, by his seed treatments—namely scab and rhizoconia. Formaldehyde controls scab, but it does not control black scurf or rhizoctonia; corrosive sublimate controls both scab and rhizoctonia. To the Formaldehyde method, therefore, must be added close sorting if potato disease control is to be most effective.

Two options are therefore open to the farmer. He may dip in corrosive sublimate, 4 ounces to 30 gallons, for a period ranging from ½ hour to 2 hours. With tubers with large lumps, the longer period would perhaps be advisable.

Corrosive sublimate is deadly poison and a little hard to dissolve unless hot water or a little acid, such as vinegar or muriatic acid, is used. Then too, the solution must be handled in wooden or glass vessels. In addition, the corrosive sublimate loses strength as it is being used and the solution needs to be replenished with poison. One lot of solution can be used four times —that is to dip four batches—and then must be made up fresh or else one ounce of corrosive sublimate should be added after each batch is dipped. The latter method keeps the solution up to strength.

And finally, this method costs a little money. At present prices, $3.00 worth of corrosive sublimate will treat from 20 to 30 bushels of seed tubers. The lessening of the time reduces the labor cost of the treatment. The only equipment necessary for the smaller acreages consists of a couple of barrels handy to the water supply. For larger areas, some sort of wooden vat should be devised to hold crates or bulk potatoes. For use with bulk potatoes, a vat with a boat-like bottom facilitates the shoveling out of the treated tubers. The vat should be lined with heavy duck painted with asphaltum. I find that farmers in general prefer this corrosive sublimate treatment to the sorting plus formaldehyde dip treatment. They want to get the diseases, scab and Rhizoctonia, and they want to go after these with a shot-gun method—one that will get them both.

Nevertheless, for the man who cuts potatoes by hand, the formaldehyde treatment has marked advantages, provided close sorting is given the potatoes during the cutting process. In this method, the potatoes are treated the proper time by soaking in formaldehyde solution made with 1 pint formaldehyde to 30 gallons of water. This solution can be used over and over, and does not need the renewal to maintain its strength. The potatoes, while still wet, show the Black Scurfs remarkably clear—the fungus growth standing out as purple knobs or flecks. Experiments at the college have shown that close sorting and formaldehyde treatment gives as good control as the more strenuous disinfection method.

As a result of experiments completed in 1917 and checked by 1918 and 1919 experience, it is possible to shorten the times of treatment from the 1½ or 2 hours for formaldehyde as has commonly been recommended, to 30 minutes for the control of scab. This gives the farmer a chance to hurry up the rather tedious process of dipping.

44 CENT EGGS

We are prepared to pay forty-four cents per dozen for strictly fresh eggs, F. O. B. St. John, N. B. All eggs will be subject to candle test and in case of dispute sworn statement as to condition will be made. Cash will be remitted by Sussex check, weekly.

All eggs must be expressed and the charges prepaid. Be careful to ship only eggs that are strictly newly laid. The most economical way is to make shipments in three case lots or over.

This price will hold good for two weeks from date of issue. Watch the Maritime Farmer for the next price.

In a short time we hope to be able to quote on dairy butter. We expected that we would be able to do this sooner, but arrangements are not yet completed.

Notify this office promptly of all shipments, giving shipping dates and full particulars.

Be sure and address all goods, The Maritime Farmer, St. John.

Do not ship to Sussex.

The price is forty-four cents per dozen for strictly fresh eggs, for the next two weeks, delivered St. John.

It also gives him leeway in the handling of the tubers. He can feel that anywhere from 30 minutes to 1½ hours is a safe time to expose the tubers to the chemical. It is best to treat whole potatoes rather than the cut tubers, because reports have come to the writer of injury to seed when it was treated after being cut.

It should be remembered that it is also possible to shorten the corrosive sublimate bath from 1½ hours to 30 minutes. With potatoes having large black scurfs perhaps the longer time would be more efficient than the half-hour period, but the diseases have been controlled excellently in our trials with the shorter time. Here again it is best for the farmer to understand that he has a leeway between 30 minutes and 1½ hours in which it is safe to treat potatoes. Over exposure to the chemical is certainly not to be advised.

Given ordinary potato soil, not too rich in limestone, in which potatoes have not been grown the previous year or two, and given treated seed, the farmer can confidently expect a perfect stand and a crop in which potato scab will be hard to find.

Seed treatment is the first step in potato improvements. After a farmer has started with as good seed as he can get this year and treoted it carefully and properly, he is then in line for a big yield, and what is better, he is in line to produce for his community a dependable seed stock; for it is by the men who take care of their potatoes by treatment, etc., that the development of high-grade stocks will be accomplished.

By seed treatment the former eliminates about one-third of his potato troubles. Here is a method whose valuue has been demonstrated over and over again by years of careful trial and experimenting. This article is a plea for the widest possible utilization of a fundamental agricultural method.

Nova Scotia Apples Ignored by U.G.G.

Under the caption, "Who own the Newspapers"? The United Farmers' Guide gives as a list of its present owners: The United Farmer's Co-operative Companies of New Brunswick, The United Fruit Companies of Nova Scotia and the Grain Growers' Guide of Winnipeg—Three big shareholders—two Eastern and one Western, yet in a recent copy of the Grain Growers' Guide the announcement is publicly made that the Grain Growers' Guide is the chief owner. The announcement has gone forth that the Directors of the United Farmers' Guide are:—Hon. T. A. Crearar General Manager and C. Rice Jones, Vice-President of The United Grain Growers,' Ltd.; Geo. F. Chipman, Editor Grain Growers' Guide; Fred W. Bishop, President United Fruit Companies of Nova Scotia and C. Ashley George of New Brunswick.

Three Western, two Eastern.

Hon. T. A. Crearar and Mr. Geo. F. Chipman visited the Annapolis Valley late in the fall of 1919 and consummated a deal whereby the United Fruit Companies of Nova Scotia acquired an interest in the United Farmers' Guide, and thus became partners with them to the extent, we understand, of $6000.00.

From the born exponents of the spirit of Co-operation, one would naturally look for some tangible co-operation of the Western United Grain Growers' Company with their Eastern allies, the Unitel Fruit Companies of Nova Scotia. What was the Maritime Farmer's surprise, however, a few days ago, on looking over the 1920 catalogue of the United Grain Growers' to find on page 87, an apple advertisement, copy of which is reproduced herewith. The Maritime Farmer asks its Maritime Province readers to carefully note the wording of this advertisement. Not a mention of Eastern apples, but: "Boxed apples from the West are steadily growing in favor on the prairies. When this company secures Western Apples for its customers, it buys them in a district where apple growing is the principal business. The apples are graded, wrapped and packed with the greatest care, and can be depended on for uniformity in size, color, flavor and freedom from blemish or decay. This great care in packing accounts for the better keeping qualities for which U. G. G. Western Apples are famous."

It seems to us that the Nova Scoti apple growers in general, and the United Fruit Companies of Nova Scotie in particular, did not anticipate such shabby treatment at the hands of Hon. T. A. Crearar and his United Grain Growers' Company.

Nova Scotia produces as good a quality of apples, in every respect, and surpasses in flavor anything that grows in the West in the form of apples. The pack put up by the United Fruit Companies of Nova Scotia is just as worthy of eulogy as is the pack boasted by any western organization. Thousands of barrels of Eastern apples are sold in western markets and undoubtedly the quantity could be increased if the United Grain Growers' Company saw fit to give Nova Scotia apples as good a boost as they do for western apples in their 1920 catalogue.

Is page 87 of the 1920 United Grain Growers' catalogue a fair example of the kind of co-operation the farmers of eastern Canada may expect from the men who are the professed leaders of co-operation in Canada?

The men who are at the head of the United Fruit Companies of Nova Scotia, and who have pledged their support to an institution of common interest, certainly deserve better recognition for their enterprise and industry at the hands of their western allies. The Maritime Farmer resents the snub dealt by our western brethren to one of our most important industries.

We understand a copy of the catalogue of the United Grain Growers' Company is placed in the hands of each and every shareholder of the United Grain Growers' Company, numbering approximately thirty-five thousand, as well as into the hands of thousands of others. A catalogue of this nature is a potent selling factor. Its pages are read and re-read, in every household and the slogan "Western apples" is consequently kept ever fresh in the minds of the good home makers of western Canada. Western apples are consequently in demand, because they are not so well acquainted with the merits of eastern apples.

Was not one of the reasons why the United Fruit Companies of Nova Scotie invested $6000.00 of their funds in the United Farmers Guide, due to the fact that there was an understanding with Mr. Crearar that Nova Scotia fruit growers would be assisted in placing their good apples on western markets? The ink on the agreement had scarcely dried when out to the public goes the catalogue in question, bearing the gospel of the merits of western apples to thousands of homes on the western prairies.

If the influence of the East is necessary for the best interests of the western grain growers, surely the spirit of reciprocity by boosting eastern apples should be shown by those who have to do with sales organization in the West.

Apples

Apples to Eat--to Cook--to Bake

--to Make Sauce--Pies--

or Dumplings

Each year United Grain Growers visit the districts where the apple crop has been best and secure for the farmers of the West the choicest apples that can be had—and distribute them at the lowest possible prices.

Apples obtained through U G G channels are sold through many local associations, and also handled at many elevator points. If you have not been able to get U G G apples in the past, or if the quantity you got was not enough, see if your local association is doing anything for 1920 They can get them for you

To secure complete satisfaction an association or local only needs to order U G.G apples and to order them early The number of cars available in 1920 will depend on the number of early enquiries and orders received.

Boxed apples from the West are steadily growing in favor on the prairies. When this Company secures Western Apples for its customer it buys them in a district where apple growing is the principal business. The apples are graded, wrapped and packed with the greatest care, and can be depended on for uniformity in size, color, flavor and freedom from blemish or decay This great care in packing accounts for the bet ter keeping qualities for which U.G.G. Western Apples are famous.

For Full Particulars write any U.G.G. Branch or Consult our Agents at Elevator Points

Fac-similie of Half of Page 87, Grain Growers' Catalogue, 1920. Issued February 1st, 1920

CO-OPERATIVE NOTES

We have been shipping auto tires pretty fast of late. Our advice today is that the near future may see another advance in price. While our present stock of non-skid 3,500 mile 30x30½ tires last, they may be had for $18.00, tubes $2.75.

We also offer a lot of heavy tourist Good year tubes 33x4 at an attractive price while they last.

Binder Twine.—We are prepared to quote a delivered price on a high grade of binder twine. Prices may go up. Order now. Freight paid on lots of 300 pounds or over.

Formaline.—We have some on hand if you want it. The price is attractive. What are you paying? We have saved quite a bit of money for a number of our subscribers. We cooperate so that the buyer saves and therefore makes his dividend on his purchase.

HORTICULTURE.

THE IMPORTANCE OF LEAVES IN THE PRODUCTION OF APPLES

(By G. E. Sanders)

Many growers will remember an article pubished by the writer in the Co-operative News sof June 22nd, 1916 with which were shown four photographs of two Golden Russet trees. The one was sprayed during the season of 1915 and bore $2.46 worth of apples. This tree held its leaves until late in November. The other tree was in the next row and was not sprayed. It bore $0.69½ worth of apples, and on account of blackspot infecting the leaves, the foilage was practically all off the tree by October 25th. In 1917 the tree that held its leaves late in the season on account of its having been sprayed, bore a full crop of blossoms and fruit in spite of the fact that it bore a full crop the previous year. The tree that dropped its leaves early the previous year on account of it not being sprayed, bore in 1917 only a few scattered blossoms and practically no fruit.

In January, 1917, President F. A. Chipman, in his address to the Nova Scotia Fruit Growers' Association, predicted that Ontario would have a small crop of appes in 1917 as the apple scab had been so bad in Ontario in 1916 as to cause the foilage to drop much earlier than usual. His prediction was fulfilled for in 1917 Ontario had the greatest failure in years in its apple crop.

In Nova Scotia in the fall of 1918 the apple leaves stayed on an unusually long time and when the first snow came late in November, the leaves held so much snow as to break trees in many orchards. In 1919 Nova Scotia had the second largest crop in her history.

All things go to show that the importance of leaves remaining on the tree until late in the fall, in the production of a crop of apples the following year. Thorough spraying will keep leaves from apple scab and cause them to remain on the tree several weeks longer in the fall than unsprayed leaves. Every day a leaf stays on in the fall of the year it is making the fruit bud stronger and the cell sap richer so as to give a more vigorous blossom the following year. For this reason throrough spraying tends to make annual crops even on such varieties as Gravensteins which normally bear every other year.

It is true that frosts such as we had in the fall of 1919 may interfere, but we are not without evidence to show that the leaf and branch on a tree that has been well fed and kept from fungus by thorough spraying will stand several degrees more frost than the leaf and branch on a weak tree. The reason given for this is the difference in the freezing point of the cell sap which is thinner and therefor has a higher freezing point in the poorly fed unsprayed trees.

Nova Scotia now has a strong lead in apple production and thorough spraying must be practiced by the apple growers if the lead is to be held. This applies to quantity as much as to the quality.

There are growers who claim as long as they can sell their apples to the evaporators and canners there is no need of spraying. If this advice is followed the leaves will become diseased and drop earlier than they should in the fall and the total quantity of opples sproduced will decrease.

It wil pay a grower to spray thoroughly even if he intends to sell all of his apples to the evaporators and canners. The proof of this statement is in the fact that canners and evaporators are moving into Nova Scotia in order to get supplies and abandoning sections that have generally neglected spraying.

Without good leaves we cannot expect appls and we must spray in order to keep the leaves clean.

VIGOROUS SEED POTATOES FOR BETTER YIELDS

While there is a great difference in the productiveness of varieties of potatoes, it has been shown by experiments at the Experimental Farms that there may be a great difference between yield in two lots of the same variety than between two different varieties. In one case, for instance, good seed potatoes yielded at the rate of 400 bushels per acre, while poor seed of the same variety yielded only 85 bushels per acre, and just as striking differences have been obtained many times. What is it that makes this extraordinary difference? One cannot tell by the appearance of the tubers what the crop from them is likely to be, as tuberss which will produce a light crop may look just as good for seed as those which will produce a heavy crop. There must then be some other means of determining what is and what is not vigorous seed.

It has been found by experience that seed from the warmer parts of Canada, where both the days and nights are warm during the growing season, does not as a rule give as good results as seed from a part of Canada where the nights, at least, are cool; although sometimes the seed from warmer districts is good. In the cooler districts the poatto plants generally grow until they are cut down by frost, whereas where the days and nights are warm the tops frequently dry up, or partly dry up, during the summer, or early autumn. As a rule it will be found that if potatoes have grown vigorousy until they are cut down by frost, or are still growing vig orously when dug, the crop of tubers will be of strong vitality, and make good seed, and if the following season is favorable and they do not suffer from disease, will produce good crops. On the other hand the crop from potatoes which ave dried up in summer is liable to lack vigor, and when used for seed next spring, gives very unsatisfactory results. Seed potatoes which have been grown on the heavier moister soils in the warm districts are likely to produce better crops than those from the lighter drier soils. Moreover there are several diseases which attack potatoes in the warmer districts which so far have not been very troublesome where it is cooler. This difference in vigor in seed potatoes may be due to the presence or absence of disease, or to the immaturity of the vigorous seed, or to both.

As the yield from potatoes of the same variety depends so much on the source of seed, one should try to obtain seed that is known to have come from a crop which was free from disease, and which grew vigorously until it was dug or killed by frost. If such infomation is not available, one will be more likely to get good seed from the cooler, than from the warmer parts of Canada.—W. T. Macoun, Domnion Horticulturist.

SHOULD ALFALFA BE GROWN ALONE OR IN MIXTURE WITH GRASSES

(Experimental Farms Note.)

So far, alfalfa is generally grown alone. The difficulty to secure a good stand experienced in the past is to quite an extent responsible for this practice, as it has become a sort of hammered-in rule to "give alfalfa every possible chance to establish itself." On this account it is generally deemed unwise to sow any grass with the alfalfa because it is considered that, in doing it, there may be a certain danger of the alfalfa not getting the best opportunity to gain a firm foothold. This view is undoubtedly correct in the majority of cases, especially where, on account of climatic and soil conditions, the starting of alfalfa may meet with some difficulties.

On the other hand, experience has shown that, in section where alfalfa can be grown easily, some admixture of certain grasses may give excellent results.. In Western Canada mixtures of alfalfa and Western Rye grass yield excellent crops providing that the mixtures are so balanced that the alfalfa and Western Rye are given equal chances to establish themselves. In Eastern Canada several grasses have been tried in mixture with alfafa, and the results so far obtained certainly seem to indicate that such mixtures may profitably be grown, providing the right varities of grasses are chosen.

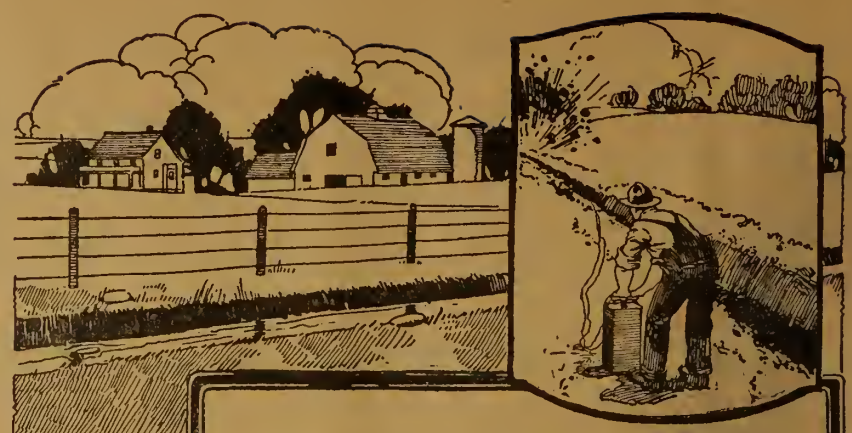
When choosing the grasses to be used in mixtures with alfalfa, it should be kept in mind, in the first place, that such grasses as are apt to choke out the alfalfa on account of their inclination to spread out must be avoided, and, secondly, that only those which are early are of any particular value. Timothy, for instance, which reaches full development comparatively slowly, is rather unsatisfactory in mixture with alfalfa. When the latter is ready to cut for hay the timothy is hardly more than half-ready, the consequence of course being that the full benefit of it is not being realized. To defer the cutting of the mixture until the timothy is at its best, can of course not be recommended for, by doing so, a poorer quality of hay will be secured as far as the alfalfa is concerned. It will also check the prompt development of the second crop.

The grasses which go best with alfalfa are those which are ready to be cut at the same time as the alfalfa. There are three grasses of this type that deserve to be mentioned, viz., Tall Oat Grass, Orchard Grass and Meadow Fescue.

The Tall Orchard Grass is comparatively susceptible to cold winters and should therefore not be used in districts where the winters are severe. Where it can be grown without losses on acccunt of winter killing, however, it goes excellently with alfalfa.

The Orchard Grass is especially well adapted to well drained soil and, on such land, it may to great advantage be used in mixture with alfalfa. Its nutritive qualities are excellent and, besides, it has the reputation of being one of the best weed checking grasses known.

The Meadow Fescue which is universally recognized as one of the most valuable grasses, especially for dairy cows, has the advantage over both Orchard and Tall Oat Grasses in that it is hardier. It may therefore be used with alfalfa in districts where the former grasses may suffer from winter hardiness. It also comes on quicker after cutting, contributes more to the bulk of the second hay crop, provides more pasture, in case the field should be used for that purpose, and yields better results on land which is somewhat wet on account of imperfect drainage. On the whole, the Meadow Fescue may be universally recommended in mixture with alfalfa.—M. O. Malte, Dominion Agrostologist.



A One-Man Job Now

—less labor, lower costs, and greater production. That's what

C X L Stumping Powder

has meant on my farm. Where I used a team of horses and an extra hired man for ditching and blowing out stumps and boulders, C X L Stumping Powder and one man do the work, and do it better.

C X L Stumping Powder means more land under cultivation, swamp land drained, dry land irrigated, better crops, larger fruit trees, and bigger profits.

"Explosives on the Farm" tells you how C X L Stumping Power can be a help to you on the farm. Write today for free copy.

SPRAYING

(Experimental Farms Note)

If the fruit grower, vegetable grower, or flower grower does not spray nowadays, he is almost certain to have inferior products in his orchard, small fruit plantation and garden. There are so many injurious insects and diseases which affect a large proportion of the plants he grows that if they are uncontrolled there will either be no crop left or else the value of the crop will be very much reduced.

There are few of these insects and diseases which cannot be well controlled by using some of the remedies which have been discovered during the past twenty-five or thirty years and which have been well tested by many experiments.

Spraying must, however, be thoroughly done if good results are to be obtained. Materials are expensive, and the cost of labour is high, and money will be wasted if the work is improperly done or not done at the right time.

The early sprayings are, as a rule, the most important, and those who contemplate spraying as all should who have orchards or gardens, should get everything in readiness to begin at the right time, as delay may mean much loss. Spray Calendars are issued by the Dominion and Provincial Departments of Agriculture, in which several sprayings are recommended to be applied at certain stages in the development of the leaves, flowers, and fruit. In the case of fruit trees the spray should be applied so that every leaf, bud, and fruit will, if possible, receive some of the material, not only on one part of it but as nearly all over as possible. Every leaf, flower and bud or young fruit missed, means a possible starting point for disease or insect pests. In the case of vegetables, promptness in the application of a good spray is just as important as with fruits. One does not need to be convinced of the value of promptness in using poison in controlling the Colorado potato beetle as the results of the spray are immediately apparent in the death of the "bugs", but more faith is required when dealing with diseases and insects which are not so readily seen but which do much harm, and usually the grower is well rewarded for such faith.

The formulae for the mixtures and solutions recommended should be followed as closely as possible. If a man knows the chemical composition of the materials he uses, and has made a tsudy of spraying, he may alter them slightly to meet certain circumstances, but if he knows little about them he should follow closely the instructions given on the Spray Calendar. He should, also spray as nearly as possible at the time suggested. A delay of a few days may mean practically the loss of the mixture or solution used as there might be no return for the labour and expense. Write to either the Dominion or Provincial Departments of Agriculture fod a Spray Calendar.—W. T. Macoun, Dominion Horticulturist.

STRAWBERRY PLANTS — WHEN TO TAKE UP OR SEND FOR

If you have plenty of thrifty pants in your grounds, of the varieties that satisfy you, then by all means use them in your settings. Take them up just as soon as you can, the earlier the better. Trim off the dead leaves and shorten the roots to four or five inches, then heal them in at once in some dry, sunny spot, as follows: Dig a trench some five inches deep, a little slanting on one side. Against this side place the plants, roots downwards, spread out fan-shape, and from two to four inches apart according to the size of the plants. The crowns should be just even with the top earth. Haul the earth against the roots, and press it firmly. When the trench is full, dig another beside it, some six inches from it, and proceed as before.

If you have to purchase the plants, get them as near home as you can get good plants of a good variety, and get them at once. If from a plant-grower, order them at once to been sent at his earliest opportunity, and treat them on arrival the same as described above. Prepare your ground where you are going to set them at your earliest opportunity, when it is dry enough to work well, which should be about the middle of May in Maine.

Then when your healed-in plants have been in three or four weeks, they will have sent out many fine rootlets and are already to be set in the beds. When taking these healed-in plants up, do as follows: Take a large pail or pan and put in it about thre quarts sof old, well-rotted manure. Mix with this about a pint of blue clay mud, and this with water enough to make the mixture about as thick as cream. In this dip the roots of the plants, about 25 at a time, and place them in a pail or box holding from one to two hundred. Take these to your plot and set them by making use of the most common sense that your intelligence can command.

Plants so treated, all things considered, are many times more valuable than those set in the ordinary way. Try it and see. "Prove all things and hold fast to that which is good."

MATURE vs. IMMATURE POTATO SEED

Much of the potato work at Aroostook Farm is carried on by the Maine Agricultural Experiment Station in co-operation with the Federal Department of Agriculture. In the potato-breeding work, the Station is well nigh a silent partner. Among this work carried out in co-operation with the horticultural division of the Bureau of Plant Industry, there has been a study of the effect of maturity of potato seed stock on the next year's crop. This has been carried on in two series differently planned.

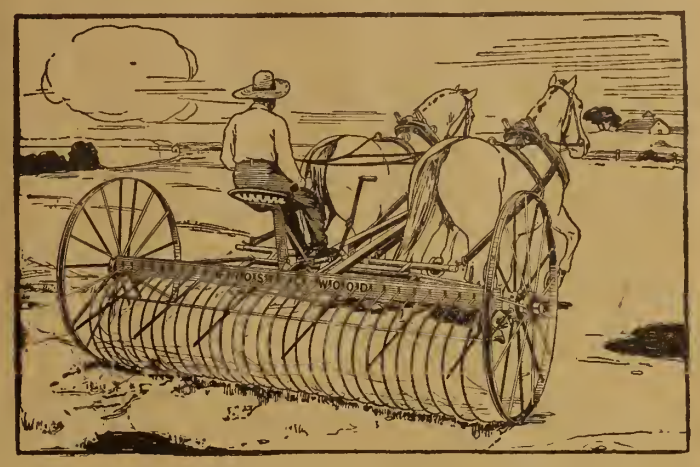
In the first series covering the years 1915, 1916 and 1917, the seed for the next year's planting was obtained by making three successive plantings at intervals of 20 days, beginning about May 20. The year in which the seed was tested as to its crop yield, the planting and harvesting of each kind were made at one time. In this series there was nothing in favor of the immature seed. On the contrary, what differences there were indicated that the mature seed was the better, both from yield and freedom from certain diseases known as streak and leaf roll.

There has been only one year's trial of the method of the second series. In 1918, all of the seed for the 1919 test was planted on the same day. Three harvests were made, Aug. 10, Aug. 24, and Sept. 17. For convenience we will call the potatoes harvested Aug. 10, immature; Aug. 24, medium mature; and those harvested Sept. 17, mature.

In 1919, all three lots were planted the same day. But each lot was harvested at three periods, Aug. 10, Aug. 26, and Sept. 19. At the time of the first harvest, the yields were in the order of the maturity of the seed. The mature gave 10 bushels per acre more than the medium mature, and eight bushels more than the immature. At the second harvest, the medium mature was in the lead by two bushels, with the immature two bushels below the mature. At the third harvest, the medium mature was 16 bushels per acre above the mature and 28 bushels ahead of the immature.

The disease factor, which was so conspicuous in immature seed from late planted stock, was greatly reduced in immature seed from early harvested stock. The total disease in per cent for the harvests was: Mature 7.4,

Frost & Wood



The "Touch-and-go Crop"

That's how a successful farmer described his hay crop. He meant it had to be cut just when ready—cured just right—and brought in just on time. He used

FROST & WOOD
Hay-making Machines

Too many farmers lose a lot of hay, or what they get has lost a lot of succulence through old style, worn out Rakes, Mowers, etc.

Why not get a Frost & Wood Automatic Dump Rake this year? A touch of your foot on the pedal and the teeth are automatically lifted and load is dumped. Teeth are highest quality tempered steel spring. Frame is high quality carbon angle steel, strongly braced and with high steel wheels. It's a quick working, high grade, light draft machine that you'll enjoy using for many years to come.

The safe way to buy is to see—
our big line at our nearest Agent's and talk the matter over with him. Write for our Hay-making Folder describing our Rakes, Side Delivery Rakes, Tedders, Loaders, etc.

Manufacturers of Shinn-Flat Lightning Rods
"The Kind That Carry a Cash Bond"
120 Woolwich St. Guelph, Ont.

medium 2.6, and immature 5.8 per cent.

From the first series the results seem to indicate an advantage from the seed standpoint of early planting, both as regards yield and freedom from disease. In the second series the value of early planting is assumed. The resulting crop from immature seed from early harvesting is below that of the medium mature, both at late and medium late harvest, and in this one year the mature seed gave a smaller yield at the late harvest than that obtained from the medium mature. So far as it is safe to draw any conclusion from so few trials, this study indicates (a) the desirability both for seed and yield of crop to plant as early in the season as practicable; (b) to hadvest the part of the crop to be used for seed when the plants have reached medium maturity and to allow the plants that are to furnish table stock to remain as long as they keep growing so as to obtain a maximum yield.—Chas. D. Woods, Director Maine Experimental Station.

LOAFING ACRES BIG LOSS—THEY CUT INTO PROFITS

Weeding out a dairy herd and getting rid of the inferior cows is a comparatively easy task compared with weeding out the unprofitabe acres of land and getting them in shape to return a profit. If the cow fails to produce profitably, her owner can sell her for something and put a better one in her place, but not so with the acre of land. The best he can possibly do is to set about the problem of building it up to a level where it will become an asset rather than a liabiity. In many instances the loafing acre hot only consumes the profits from the more productive acre, but is a constant source of loss in preventing the practicing of suitable crop rotations on the adjoining acres. An acre of low, wet land in the middle of a large field may so delay cultural work or prevent the use of harvesting machinery to such an extent that one would be justified in expending double the value of the acre of and in getting it properly drained so as to facilitate the working of the entire field. Likewise low, wet places in the pastures produce weeds and grasses of of little feeding value, besides affording mud hole and stagnant ponds for the stock, more particularly dairy cows, to walk through and get their flanks, udders and bellies plastered with foul mud and slime. Such places should be drained put to producing grasses even though the original cost may exceed the value of the land itself. Spots occupied by trees, stumps and heaps of stone frequently reduce the average yields per acre, delay cultural work in the spring and cause delays and breakage in farm implements.

Crooked fences and too wide head lands afford ideal places for weeds to grow and go to seed, besides the few bushels of grain and few hundred pounds of hay they should produce helps to keep down the average crop of the entire field. Such little losses in acreage on a large farm count a whole lot in the aggregate in figuring the profits at the end of the year. The idle acre not only represents a definite source of loss in the shape of taxes, interest and other charges, but it adds to the overhead charges which must be borne by the adjoining acres. The investment required to get these places to producing something of value not only returns interest on the land itself but on the arger production of the entire field.

HOW KEROSENE EMULSION IS MADE

From a cake of laundry soap cup out a cubic inch—that is, one inch each way. Shave it into a cup of soft water and boil for a few minutes in a thick vessel which will hold the heat for a time. When it is dissolved remove from the fire and pour into it, while still hot, two cupfuls of kerosene oil. Agitate violently with an egg beater unti the oil is perfectly emulsified, when it will have a creamy appearance and will not readily separate from the water if allowed to stand. Or in place of an egg beater one can pour the mixture in to a two-quart fruit jar and vigorously shake it, with an up-and-down motion, until the mixture is completely emulsified. This should require at east ten minutes. The mixture is known as the stock emulsion and must be diluted before using. For use as a dormant or winter spray against scale insects it should be diluted at the rate of one part of the stock emulsion to three or four parts of water. In other words mix one cupful of the stock emulsion in a quart of water. For plant lice it should be diluted at the rate of one part of the stock emulsion in ten to fifteen parts of water, or mix one cupful of the stock emulsion in three quarts of water. This more diluted spray should be used if there are any leaves on the plant to be treated, and in all cases the spray mixture should be kept stirred or shaken while applying. If this not done a good mixture is not maintained, and burning the leaves may result. The possibility of such injury to the plants will show how important it is that all these sugestions and directions should be carefully followed.

POTATO GROWERS' ASSOCIATION

A potato Growers' Association for Prince Edward Island was formed in Charlottetown recently at a well attended meeting held in the Board of Trade rooms.

There was a good deal of discussion and several interesting addresses in respect to potato growing, which on account of the immense price, is just now a subject of absorbing interest throughout the Province.

The following officers were elected:

President.—A. E. Dewar, Charlottetown, Royalty.

Vice-President for Prince County—J. F. McFadyen, Cape Traverse.

Vice-President for Kings County—D. F. McDonald, Montague.

Secretary — Wilfred Boulter, Dept. of Agriculture.

Executive Committe, Prince County—Dr. Johnston, Tignish, A. E. McLean, Lot 16.

Queens—Artemas Moffatt, Mayfield, Peter Brodie, M.L.A., York.

Kings—Peter D. Peters, Rollo Bay; E. B. McLaren, Georgetown.

The following resolution was unanimousy adopted:

Resolved that the erection of a plant to take care of our potatoes in the event of a year of over-production or our No. 2 potatoes in the year of normal production is most desirable, and further resolved that our secretary be instructed to write the Falk

CLUB ROOT AND FORKED CARROTS

Kindly tell me what crops are subject to club root; the cause of this disease; and methods of getting rid of it?

I would also like to know whether commercial fertilizer would make a good top dressing for carrots, and if it is apt to cause forked roots?

F. L.

Club root is a disease common to such crops as cabbage, cauliflower, kale, Brussels sprouts, Kohl-rabi, turnips or radish. The preventative measures are, the practice of crop rotation of any of these crops not any oftener than once in three years on the same sod; the burning of all refuse from infested crops; and the application of lime from one to three tons per acre, the latter quantity, if the soil is heavy or clayey. Winter ridging of the infested land curtails the disease to a limited extent on the following crop. It can be carried from one piece of soil to another by the roots of the plant; if the seed bed is infected, the plants from that seed bed will infect that part of the field to which the plants are transplanted.

To grow carrots successfully the soil must be tilled deeply and the manure plowed down as deep as possible. A plan for manuring land for carrots that was practised successfully by the writer was to spread the manure heavily over the land before plowing, and have it placed in the bottom of the furrow behind the plow as each furrow was plowed. The furrow should be as deep as possible, 10 inches or more. The plowing, and manuring should be done in the fall or very early spring, the fall preferably, and the seed sown in rows on the surface at suitable distance apart for proper cultivation and growing. For horse cultivation they cannot be nearer than eighteen inches.

The fertility problem in vegetable growing is one of the most important of the many difficulties confronting the gardener. Vegetable crops remove large amounts of fertility from the soil, hence the maintenance of the highly condition necessary for successful vegetable production is not a simple matter.

Since the amount of phosphorus contained in most soils is small, and since manure is low in that element, applications of some commercial form usually prove profitable. For immediate results, acid phosphates and steamed bone meal are the best forms to use. It should be sown on the surface and incorporated with the surface soil before sowing. For carrots a good mixture is 100 pounds nitrate of soda, tanakage 250 pounds, superphosphate 200 pounds, and sulphate of potash 200 pounds; in all 750 pounds, a quantity necessary for one acre.

Lime benefits practically all vegetable crops; ground lime stone is the cheapest form, and one of the best. Carrots grown in this manner will not be forked.

DUSTING

It must be a bit gratifying to those men who have been endeavoring for years to convince orchardists, and all other users of insecticides, of the superiority of dust over liquid sprays, to have that question so thoroughly and favourably discussed at the recent annual meeting of Maine orchardists, and especiall gratifying is the advocacy of State Horticulturist Dudley, who has come to be regarded as a leading authority in all pertaining to his chosen field of labor.—Maine Farmer.

Our O-K on the Aylmer Sprayer

We have just purchased the manufacturing rights of the Aylmer Barrel Sprayer, which makes our line of spraying machinery complete and adds a new type of sprayer, which has found favor with Canadians for more than 20 years. It will in future be known as the

O-K Aylmer Barrel Sprayer

and enables us to offer to the farmer and gardener a matchless range of sprayers. The O-K Aylmer will be improved by the addition of our non-clog nozzle, while retaining the best features of the famous Aylmer pump. This pump requires no packing and is sold with or without the barrel. It is particularly adapted for efficient orchard work, and for many other uses, especially for the fumigating of buildings and the applying of whitewash.

Two-Row Sprayer

If interested in the O-K Aylmer Barrel Sprayer write for more particulars.

We also manufacture the O-K-Spra (knapsack) and the O-K Canadian Two-Row and Four-Row Sprayers. We supply spraying calendar suitable for Canadian conditions with each sprayer.

Write for literature.

THE LA HAVE CREAMERY COMPANY, LTD. ANNUAL MEETING

The Sixth Annual Meeting of the La Have Creamery Company, Limited, was held at New Germany on Thursday, the 26th February, President C. R. DeLong presiding. About one hundred shareholders were present.

The report of the Sec'y-Mgr., J. D. McKenzie, showed an increased volume of business over 1918. The total being 199,195 pounds of butter at a value of $111,410.44. Ice Cream $16,874.37. Total turnover $139,280.80.

The president's address was full of encouragement for the future. The Directors during the year had contracted for a new 15 ton refrigerating plant and a large new Ice Cream outfit. Recommended a 6% dividend on the capital stock. He also spoke on rural population and stated that the farming industry would have to be made still more attractive to hold the young people. The Co-operative Creamery was one of the means that was helping towards this end.

The following were elected Directors. The first two were re-elected. Elijah Henley, Chelsea; E. B. Smith, Caledonia, and Percy Starratt, Falkland Ridge.

Addresses of practical interest were delivered by J. J. Kinley, M.P.P., Lunenburg; H. R. Brown, Promoter of Dairy Industry for Dominion Department of Agriculture and W. A. MacKay, Provincial Dairy Superintendent.

Resolutions were passed endorsing the action of the Directors installing a refrigeration plant. Favoring more stringent cream grading. Endorsing the supporting financially of the Nation Dairy Council and Dairymen's Association. Favoring the appointment of a District Representative for Lunenburg and Queens.

A vote was taken between Bridgewater and New Germany resulting in favor of New Germany as the place of the next annual meeting.

Dinner was provided for the Shareholders by the I. O. O. F. Lodge and musical entertainment was provided by the New Germany Ladies.

The meeting was one of the most successful in the history of the Company and the prospects for the future bright.

DOMINION DEPT. OF AGRICULTURE DAIRY AND COLD STORAGE BRANCH

The Dominion Educational Butter Scoring Contest, Season of 1920

The Educational Butter Scoring Contest conducted in 1919 was so successful that it has ben decided to continue the work during the season of 1920.

The contest will be conducted under the same general rules as in 1919. The provincial dairy authorities have again agreed to co-operate and to make the necessary arrangements for the samples. The rules, republished herewith for general information, are as follows:

1. It is requested that four creameries in each province send by express 14 lb. box of butter addressed Dairy Commissioner, c/o Lovell & Christmas, 112 King St., Montreal, Que., to arrive before the 20th of each month, May to October, inclusive. Shipping tags will be supplied.
2. Full details as to the handling of the cream and the manufacture of the butter are to be given on forms provided for that purpose by the Dairy Commissioner, Ottawa.
3. The butter will be scored on its arrival at Montreal and then placed in cold storage for rescoring, by the same judges at intervals throughout the season.
4. The percentages of salt and moisture will be determined in each sample and a test made with the Storch Test.
5. Reports of the monthly scorings, re-scorings and other tests will be sent to the contestsants and to every creamery in Canada.
6. The Dominion Dairy Branch will pay for the butter at market prices, on receipt of proper invoices, in duplicate, and will also pay the express and storage charges.
7. Full shipping instructions and forms to be used will be sent as soon as the names of the creameries are received from the provincial authorities.

The samples will be used during the winter of 1920-21 for demonstration purposes at the dairy conventions, for education work in the dairy schools, for conferences of graders from the different provinces, etc.

J. A. RUDDICK,
Dairy and Cold Storage Com.
Ottawa, Ont., April 10, 1920.

Shorthorn cows averaged 1146 lbs. of milk and 46 lbs. of butterfat, an average test of 4% for the month of February, for the 22 cows making 1,000 lbs. of mik or 40 lbs. of butterfat, as reported to the Milking Shorthorn secretary, Roy A. Cook, Independence, Iowa.

Bellevue Herd, Gonschohocken, Pa., has the high cow, Rosemary 2nd. Oaklawn Stock Farm, Lime Springs, Iowa, has the high four year old, Prize Rose. Flintstone Farm, Dalton, Mass., has the high three year old, Lady Sale 21st. Bonvue Farm of Golden. Colo., has the high two years old, Saly Wood 2nd.

Miking Shorthron breeders make a profitable yield of milk and a profitable production of beef from their cattle, maintaining a uitility type that, while not equaling the special purpose dairy cattle in milk yield, nor the beef alone cattle in beef form, affords a type much in favor with the general farmer.

The February list, wth names of cows, owners, amount of milk and

To any Dairy Farmer,
Anywhere.
But the Sharples to this test—
Run skim milk from any other separator through the only suction-feed machine.
Sharples Separator Co.

THIS invitation is extended to any dairyman who thinks of buying a cream separator. It is founded on actual fore-knowledge of the result of the test—not upon speculation.

The Sharples Suction-Feed Cream Separator skims clean at any speed. It is the suction-feed principle that enables it to do so and that principle is protected by patents. No other separator can use it.

The knee-low supply tank, the one piece tubular bowl—no discs to clean—are other exclusive Sharples features.

The separator that gets the most butterfat out of milk is the only one it will pay the thrifty dairyman to buy. It is because we know the Sharples gets more butterfat than any other separator, that we ask the prospective buyer to put it to a test that cannot fail.

Don't feed two cows to make butterfat when one is capable of making the same amount. Not more cows but better cows should be the plan of the American dairyman today.

NATIONAL DAIRY COUNCIL OPPOSES ELIMINATION OF COMMODITY RATE ON CHEESE

To the Members of the National Dairy Council:

Gentlemen:

The application of the Railway Companies for the elimination of commodity rates on cheese to Montreal, so that the higher class rates should apply, came up before the Railway Commission recenty. I was assisted in opposing the Railway Companies by two members of our Council, Messrs. James Donaldson and R. G. Loggett, and by William Brown, President of the Eastern Ontario Dairymen's Association, T. A. Thompson, Secretary of that Association and G. G. Publow, Chief Dairy Instructor for Eastern Ontario.

The Montreal Board of Trade also joined in opposing the Railway Companies. We pointed out that in other cases, the Board had come to the conclusion that where a stable article of food enjoyed a commodity rate, that rate should not be cancelled. We also pointed out that cheese had been subject to the three general increases, which had gone into effect in the last few years. We showed that the cost of producing cheese had gone up more rapidly than the selilng price of cheese, and that in the present unsettled state of the cheese market, the trade could not stand any further increase in rates. We therefore urged that the Railway Companies' Application be dismissed. The Railway Commission reserved its decision. I am inclined to the opinion that the present rate will not be interfered with under present conditions.

Yours truly
D'ARCY SCOTT,

It will be remembered that not many years ago a shipment of Holstein-Friesan breeding stock was by special Government permission allowed to enter England from Holland, and it is from these foundation animals that the numerous British herds of this breed have been derived. It now from Canada will be permitted to enseems that the time has come when it will be necessary to introduce fresh blood for the revival of these British stocks, and to that end it is stated that next year a shipment of Holsteins from Canada will be permitted to enter England. The cattle will require to be introduced on a special dispensation, for the British Government does not permit entry of live cattle in ordinary circumstances. Meats may enter, but live cattle have to be slaughtered at special landing docks, the idea being to keep out disease. As another shipment of Holstein-Friesians from the continent is out of the question, the importation of the Canadian Holsteins is, according to The North British Agriculturist, to be allowed under specific conditions taken to safeguard against the introduction of any disease. A further provision will be made in the case of cows, every one of which must be a "2,000-galloner."

Warts may be greatly benefited or entirely removed by the application of pure olive oil, the oil being generously smeared over the surface of the warts after each milking. Persistent warts require surgical interference.

Careful Inspection of Every Part
DE LAVAL
For Forty Years
The World's Standard
Perfectly designed with a staff of skilled engineers constantly striving to improve it, the De Laval is built of the best of materials, by the best of mechanics, and with the best of equipment—with forty years of experience behind it.
Every piece of material and every part is carefully inspected and tested. The limit of permissable variation in size of most of its parts is less than one-thousandth of an inch.
These are the basic reasons why the De Laval costs more, does better work, produces a better product, requires less attentton, and lasts far longer than inferior separators.
Your local De Laval Agent will be glad to demonstrate the superiority of the De Laval. If you don't know him please simply address the nearest main office as below.

LIVE STOCK.

FEEDING INFERIOR HAY TO LIVE STOCK

If the problem of getting rid of the inferior hay, a quantity of which every farmer has, is to be solved correctly, it must be considered with reference to the cause of the inferiority of the hay. In some cases this is to be found in the fact that the material from which it was made was poor. In others the grass was good, but was either too ripe when it was cut or else it was imperfectly cured or improperly stored. As a result the hay is not as nutritious, as palatable, or as digestible as it might and would have been if it were made of better grass, or the grass from which it was made had been handled more skillfully. The best method of using it will depend upon the character and extent of the existing deficiency.

It will not be possible to improve the quality of the hay. It can be made worse, but there is no way in which it can be made better. We can add more valuable materials to it, or mix them with it, and thus obtain a more satisfactory ration, but the improvement is entirely in the line of a supplement and does not affect the real character of the hay. It seems to me that the sensible procedure is to feed this inferior material in connection with better hay, with grain, or in the case of dairy cows, if they must have it at all, with both hay and grain. In this way the deficiency of nutritive matter in the inferior hay can be made up.

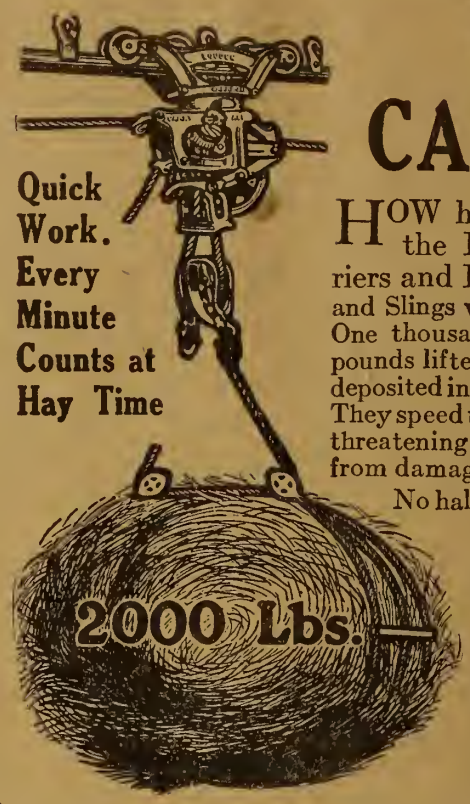
Hay that is unpalatable will remain so if it is fed alone, but this unpleasant peculiarity can be largely overcome by the addition of meal, molasses or some other appetizer. For the improvement of hay that is indigestible very little can be done that will not cost more than it is worth. Such hay was mostly made from grass that was allowed to stand too long. Chemical and physiological changes during the process of ripening have made the stalks hard and woody and thus lessened their value for feeding.

Inferior hay can be fed to some classes of stock to much better advantage than it can be to others. If it falls much below the standard for good hay it is not suitable for horses, for sheep or for cows that are giving milk. If it must be fed to such animals it is an evil which should be tempered as much as possible by care in the manner of feeding, and good judgment regarding the times when it shall be fed and the quantity that shall be used at a time. As far as possible the inferior hay should be given to young stock, or to cows that are drying off and that will not calve for some time, though for such cows it should be used for only a few weeks. And the same care in ways and times of feedisg should be taken as is required when it is given to other classes of animals to whose needs it is still less adapted.

All of the inferior hay should be used in cold weather. Cattle have better appetites then and will eat it more readily than they will in the milder days of spring. They will also take more kindly to it if it is used in the early feeding than they will if they are previously kept for some weeks on hay of better quality. I have known it to be fed almost exclusively from late in the fall until it was all used, while the season for feeding it was wisely chosen. I am sure that better results would have followed if a moderate quantity of better hay had been mixed with it.

Where the quantity of inferior hay is not very large I think it is best to feed it only once a day. This feeding should be the first in the morning when the appetite is keen after the long fast of the night. If there is too much to be used in this way, I would give another feed in the afternoon. This will be better than it would be to give a large quantity at one time

LOUDEN



HAY CARRIERS

Quick Work. Every Minute Counts at Hay Time

HOW hard and faithfully the Louden Hay Carriers and Louden Hay Forks and Slings work at haying time! One thousand to two thousand pounds lifted from the wagon and deposited in the mow at every trip. They speed up haying and beat the threatening rain—save your crop from damage at the critical time.

No halts. No trouble. Louden Hay Carriers are strong and powerful and with an extremely simple and sure-working mechanism. They pull loads through small doors, over beams and drop them exactly where you want them.

The Louden Illustrated Catalog tells all about them and other Louden Haying Tools. Write for it, and if desired, we will also send the Louden Book of Barn Plans—all about barn planning, materials and construction.

in the morning. If there are large weeds, or other materials which are not fit for fodder, mixed with the hay, the stock should not be starved into eating them, but all the leaving should be thrown out before better hay is given. Cattle like clean mangers and they ought to have them.

Ottawa Valley Journal.

THE HANDLING OF HIDES

One of the chief factors in determining the value of hides is the quality of the take-off. In the trade the removal of hides is the work of specialists, while in the country, skinning is only an incident in the general work of the farmer, or local butcher. For these reasons the hide removed by the trade is generally superior to the country hide, not only in the take-off but as well in the salting and packing. The difference in quality is indicated by the classification of hides as "Packers" and "Country."

An outline of the essentials to the essentials to the marketing of good quality hides may be of some interest.

The loss in hide values through branding is very great, and it has been suggested that the animal be branded in the neck or shoulder, areas of the hide less valuable than the flank. Often the brand is so deeply burned as to show on the reverse side of the hide. If some method of marking other than branding could be made practicable, it would result in a very marked appreciation in the value of our annual production of hides.

In bleeding, it is better to cut in a direct line with the centre of the lower lip and the point of the brisket, rather than across the throat, as the latter method renders the hide above the shoulders practically useless. The tail-bone, horns, and the top of the skull, which are often left on the hide, should be removed. After removal, the hide should be laid flat, salted, and left twenty four hours and again salted before rolling. Where hides are rolled immediately after salting, heating occurs, and this causes the hair to decay, resulting ultimately in destruction of the grain in the leather. Deacons, or hides from immature calves which are subjected to sun drying, lose practically all their natural oil; it would be profitable to treat these in the same way as the larger hides, special attention being paid to the removal of all meat, so that the hide may be preserved as well as possible.

DE-HORNING ADDS VALUE

New Zest in Canadian Cattle Campaign

A zest has entered into the campaign for de-horning Canadian cattle. The example of the most successful farmers is being copied by those quick to see the money-value of the idea.

Probably a quarter of a million dollars a year are lost to farmers by the non-practice of a simple de-horning process.

Live stock exchanges in Winnipeg, Toronto and Montreal, especially encourage de-horning. Practically all the American native cattle, with which Canadian farmers in the West have to compete, have the advantge of being thus treated. They bring a larger return in dollars and cents.

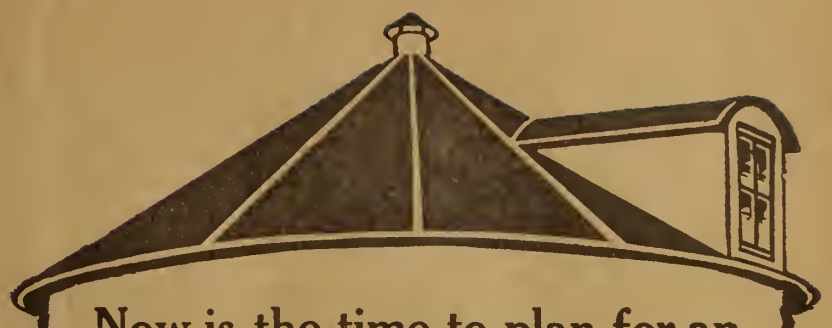
In a circular by the Dominion Government, farmers are told that they will benefit briefly for the following reasons:—1, Better appearance of the cattle; 2, quieter, subdued nature, enabling fattening at less cost; 3, more cattle can be shipped in one car by rail, saving freight cost.

But it is when the animal is finally brought to slaughter that the value of de-horning is proved. Over 70,000 pounds of meat a year are actually reported at inspected Canadian packing plants alone as wasted through bruises in the flesh. Most of the bruises are caused by the animals' horns while in transit from the farm to the market and the abattoir.

That total represents the parts of meat utterly thrown away. There is a further and even greater loss. When a piece of meat is removed from a quarter of beef because of a bruise, the rest of the quarter or part of it has often to be sold at a cent and one-half or two cents a pound less—not because the meat is poor, but because that part has lost in appearance and sale value. Probably one in every five cattle bought on Canadian stock yards suffers from injury which could be prevented were de-horning commonly practised. The packers' buyer necessarily takes the loss into account and the farmer who sells cattle takes the risk and a lower price.

A united effort is now being made by the Dominion and Provincial Departments of Agriculture, the live stock exchanges throughout Canada and the meat packers collectively, to get a better knowledge diffused among Canadian farmers of the real importance of de-horning.

The Industrial & Development Council
of Canadian Meat Packers,
186 King St. W., Toronto.



Now is the time to plan for an IDEAL GREEN FEED SILO

Begin now to plan for a silo before the spring rush is on. It will enable your cows to give 25% more milk on a cheaper ration.

The Ideal Green Feed Silo has been the choice of thousands of Canadian farmers because it is the best silo available. Sound lumber best suited for the purpose is used throughout. The staves are carefully made and finished. They are held together with extra heavy steel hoops. The doors and staves are treated with a specially prepared preservative.

The Ideal Silo lasts a lifetime and at present high prices for butter-fat pays for itself in a short time.

IMPORTATIONS OF LIVE STOCK FROM THE UNITED KINGDOM

Upon inquiry of the Steamship Companies, it has been learned that importers are likely to experience considerable difficulty in securing transportation for stock from the United Kingdom to Canada during the coming summer. This is due to the heavy passenger and freight movement, space for which has been booked well in advance, and to the fact that few ships are available for the carriage of live stock and many of these can only be equipped at considerable expense. Small shippers are likely to suffer most, in view of the fact that accommodation will probably be refused at all unless a minimum of business is offered. £250 has been suggested as the minimum which will be required.

The Steamship Companies indicated their desire and intention to meet the situation in the most practical way possible, and the suggestion was made that, so far as possible, shippers should cooperate in making application for space by planning to assemble their purchases for shipment on a particular boat at a given date. Such an arrangement, it was intimated, would greatly facilitate business and justify the Steamship Companies in meeting the needs of the shippers. The Live Stock Branch will endeavour to facilitate any arrangement of this kind and will be glad to receive letters from importers advising of their requirements. It is suggested, however, apart altogether from any assistance the Government may provide, that importers will do well to arrange for their own shipment, in so far as possible, in accordance with the plan as above outlined.

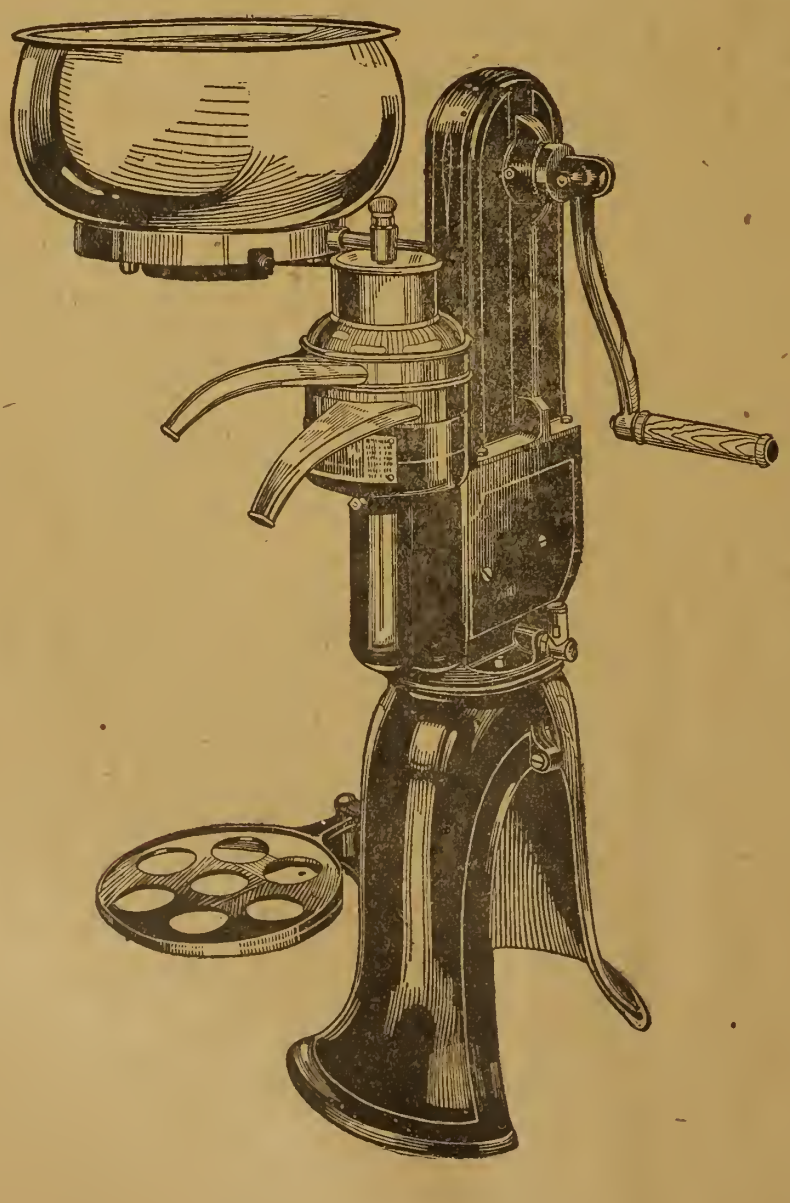
No Crean



THIS farmer owns a Renfrew Cream Separator. That means that he gets absolutely full value for his milk, cream and butter. There is no possibility of a loss.

The Renfrew—widely known as the closest skimming separator—gets 99.99 per cent. of the butter-fat! That has been proved by the Government Dairy School tests. It is a truly remarkable achievement, and is an unsurpassed record.

It is obvious that such close skimming means *bigger profits* to the owner of a Renfrew.

Furthermore, it is a hard, steady worker. A Renfrew owner never worries about a breakdown, or breakage of any part.

It Is Sturdily Built

and will last a life-time. Year in, year out, it will toil steadily along, never causing trouble.

The Ren

Branches:—Montreal, P.Q.; Sussex, N.B.
Milwaukee, U.S.A.

Lost on This Farm!

It is made throughout of the highest grade material, accurately manufactured and very carefully fitted. The patented clutch, for example, enables the gears to stop while the bowl is running down. That prolongs its life. From the standpoint of durability and cost per year of service its owners estimate that it is a 33⅓% better investment than an ordinary separator.

Self-Oiling System

The working parts of the Renfrew are enclosed in an oil-tight, dust-proof housing. No oil can escape to drip down the spouts or on the floor, and the oiled parts run silently and smoothly. Four times a year it is necessary to replenish the Renfrew's oil supply. Think how clean and easy-running it is

It is Easily Cleaned

The wide open bowl and smooth-polished steel discs are very easily scalded and rinsed.

The crank is high—just in the right place to make it comfortable to operate.

Because of the anti-splash milk-can, the milk cannot splash out. The can is low—that means fewer backaches. That is a point much appreciated by women. Users of the Renfrew get

Firmer; Better Butter

and more of it, because of the exclusive, wide open bowl with the curved wing centre-piece. The milk is distributed to the discs in thin, even sheets. The fat globules go through unbroken.

One Renfrew user wrote us recently to say that he passed sour and curdled milk through his separator, and got 2½ pounds of butter from it, and that he thought it got all the butter-fat there was in it.

It was invented by a Canadian, is made in Canada by Canadian workmen, and Canadian money finances its production.

Write us for catalogue, tests, and other particulars.

THE HORSE

FITTING HORSES TO ENDURE HARD WORK DURING SPRING

Thousands of farm horses die every spring and summer during the extremely warm weather, and if you were to ask their owners the cause of it they would tell you that the heat had been responsible for their deaths. But long before the heat season comes, the seeds of horse trouble are sown, for the reason that he is not properly fitted to successfully overcome the combined trials of hard work and hot weather. There is much loss of farm horse power as a result of farmers forgetting that in winter the horse has to be fitted for spring work. In nature the wild horse has a hard time in some regions in living through the winter, but if he does live through till the grass grows, he soon picks up again. But he has not to do the hard work of the domesticated horse, and the soft grass to him is both feed and a tonic. This is how a large percentage of horses are kept in winter, just existing, and farmers expect that with the grass, the horse will not only recuperate but will, at the same time, do all the pulling power in the rush time of hard work.

The average farm horse is called upon during the spring time to do the severest kind of work throughout a long day under feed conditions that are most unfavorable for hard work. The most common complaint is that of horses being unable to withstand heat and are inclined to weaken themselves by sweating profusely. This condition is most generally caused by too succulent feed, such as the young green pastures provide, along with an unbalanced grain ration. A satisfactory grain ration in the working season is on the average about one and a quarter pounds of oats per day per 100 pounds of live weight. In addition, the horse should receive what he will eat up of a good quality of mixed hay. A little grass serves as a splendid body regulator, but too much grass will cause weakening from excessive sweating. Where a good quality of hay is fed to horses with their night meals, it is safe to turn them on pasture after this meal is finished, if considered desirable.

But teamsters, who have neglected their horses somewhat in the winter time, need not think they can overtake the lost ground by a sudden change to heavy and good feeding. In feeding horses, all changes in the kind and nature of the food should be made gradual. For instance, a sudden change from hay to straw, or from straw to hay, from oats to other kinds of grain, or even from whole oats to rolled oats, from green food to dry food, or more especially from dry to green food, tends to excite digestive trouble, and less resistance to the heat of summer when at work. Any change in the kinds, quality or the food should be made gradually. Sudden overfeeding in the spring is no remedy for the evils of neglect during winter, and it is only the continuously well-fed horse that can stand the full ration in spring.

How Horses Succumb in Heat

The horses that are caught by the heat are generally those that have been overfed without sufficient exercise during winter or those of the other extreme that have been underfed. There are temporary remedies that will relieve the animal after a heat attack, but allow the attack to come to the acute point of inability to move any further and there is little hope for an immediate restoration to full ability to keep up under the strain of hard work.

Every teamster in hot weather should keep his eye on the team so that he can note the first signs of failure under the heat. When a draft horse begins to pant, when his work is only done at walking speed, it is time to do something to relieve him. If he braces his legs when you stand him for a rest he is far from being a horse able to continue for much longer in the field, and if he should suddenly stop sweating while still working hard, his case is serious. For immediate relief when any of these symptoms appear a two-ounce dose of aromatic ammonia, or two ounces of sweet spirit of nitre is recommended, but that is only temporary, as it will not fit him for continuing the work, fully freshened up. What a horse has lost by months of inattention to his fitting in winter for spring and summer work, cannot be re-established in his anatomy by doses of medicine.

In Case of Colic

give your horse Dr. J. Woodbury's Horse Liniment internally—and at the same time, build up the general health and digestion of the horse, with Dr. J. Woodbury's Condition Powders.

Colic in a horse comes from the same cause as colic in a baby—acute Indigestion.

These remedies tone up the stomach, regulate the bowels and kidneys, help the digestion and soon put the animal in the best possible condition.

Dr. J. WOODBURY'S Horse Liniment and Condition Powders

used whenever an animal is troubled with Cough, Cold, Distemper, Glanders, Splint, Curb, Spavin, Cracked Hoof Enlargement, Cut, Sore, Bunch, Fever, these two reliable remedies will give prompt relief and change the sick, lame animal into a vigorous, healthy one.

Keep these standard preparations always in your stable in case of sickness or accident.

Percherons & Belgians

30 Head

Stallions & Mares

FOR SALE

Come to Grenville and buy the kind with the big, round feet, clean, hardy, dry bone and joints, sloping pasterns and straight, flashy action. Buy the kind with the sloping shoulders, short back and long, level croup. Buy the modern Percheron or Belgian.

Our prices are very reasonable, and we will give up to three years time, to responsible parties.

All stallions government inspected.

J. E. ARNOLD & SONS

GRENVILLE, - - - - - - - - QUE.

There are too many horse owners who act as if this were possible. To use a Scotch expression, a horse that has not got enough "guts"—that is the quality that comes from building up his strength and endurance from the inside—can never fulfill his mission when up against it in summer heat in tilling the field. Attacks of sunstroke are not unusual, and for this the Arabs of the desert, who perhaps understand the horse better than any other race, inject 30 to 50 grains of quinine under the skin.

Spring Clipping of Horses Unseasonable

Another sure way of keeping the horse in a poor way to start spring work is to let his hair and hide get full of dandruff and dirt. To get over this condition some men clip their horses, but spring clipping is unseasonable and in the opinion of the writer, clipping is unseasonable at any time. It is only trying to overtake a duty at one sweep in the springtime that should have been done piecemeal throughout the winter by careful grooming. Spring clipping deprives the horse of his greatest protection in the most critical season of the year.

In the springtime a horse is suddenly subjected to remarkable change. The organism that has withstood the winter goes through a swift metamorphosis. The animal's digestive system as well as his pulling power is acected. Inside and outside it has to adjust itself. This adjustment should be left to nature. A horse is weakened by the sudden removal of his natural defense. Every square inch of clipped area is exposed to the intrusion of disease by prying open all the pores and leaving them quick to the air. Every individual hair has its function, and it is up to the horseman to keep that hair in a healthy state and free from dandruff, dust and vermin. Clustered around the root of each hair are the sebaceous glands from the hair that draw to the surface of the body an oily fluid. This fluid is the animal's chief reliance against disease-bearing enemies. Without the hair this functional work is checked and the animal suffers by the change. The requisite of a healthy horse is a healthy skin, and the skin cannot be healthy without its full coat of well cleaned hair.

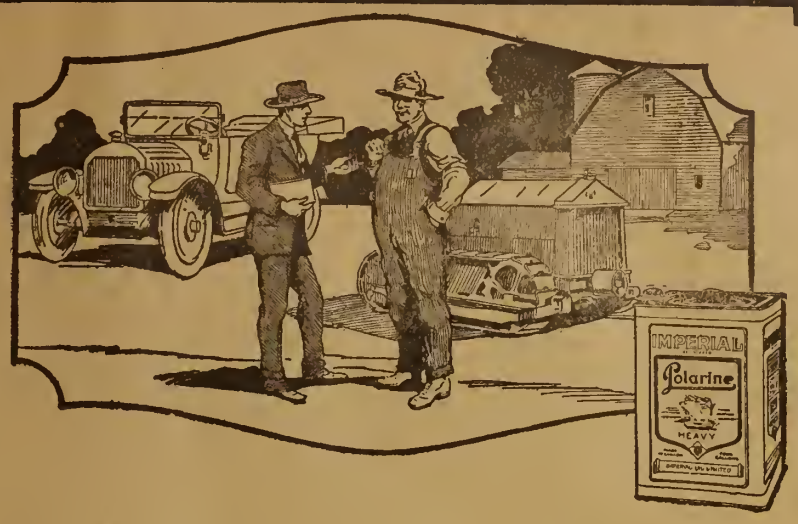
Horse owners should also remember that horses get thirsty more often than their teamsters naturally do. There are not many teamsters who fail to provide a water supply for themselves in the hot field, but few ever think of providing water for their horses while at work. Providing a drink in the mid-forenoon or afternoon is another one of the little duties that mean much to the endurance, comfort and power of the horse.

Ottawa Farm Journal.

THE ORPHAN FOAL

If a colt is orphaned immediately after birth, or for any reason can not get his mother's milk at once on being born, he should be given a physic of two tablespoonfuls of castor oil in a little milk, or should be given a rectal injection of some such mixture as warm water, flaxseed tea and sweet oil. Raising a colt by hand is a bothersome job, but it is better than losing the colt. A good substitute for mare's milk is made by mixing three pints of cow's milk (preferably from a cow recently fresh), one pint of warm water, four tablespoonfuls of sugar, and eight tablespoonfuls of lime-water. Give this to the colt fresh, warm and clean, and at regular and frequent intervals. At first it may be necessary to feed it in amounts of a quart or so every five hours. Before the colt learns to drink from a pail, it may be necessary to feed him from such an arrangement as a bottle or teapot equipped with a nipple. As he gets older, he may be fed less and less frequently, until when he is several weeks old, it may be necessary to feed only two or three times a day, from a pail. When the colt is five or six weeks old, start him to eating a little grain. A mixture of corn, bran and oats is good. At this time he may be changed from whole milk to skim milk, which is fed fresh, warm and clean and in moderate amounts. If any symptoms of scouring appear, give a dose of three or four tablespoonfuls of castor oil and sweet oil mixed, and reduce the milk supply for several days.

The Horse Association of America, a non-profit corporation organized under the laws of Illinois, is now an accomplished fact. The organization is backed by horse bereders representing all breeds of horses, by the saddlery and harness interests, by the horseshoe manufacturers and master horseshoers, by the hay, grain and feed interests, and by the carriage and wagon builders of America. The purposes of the association as set forth in its charter are to aid and encourage the breeding, rearing and use of horses. The primary aim of the organization will be to bring prominently before the public and all transportation users the great part which the horse plays in agriculture, commerce and transportation, to emphasize the important part the horse occupies in pleasure, and to work ceaselessly for the improvement and upbuilding to higher standards of our existing types of horses. Of the 21 million horses now on farms and ranches in the United States, it is safe to say that less than five million are of distinct types, well calculated to do their particular job in life. The Horse Association of America, through every conceivable avenue of effort, will work for the improvement of our horses to the end that the majority of them may be highly efficient in the particular line for which they are intended.



"This Tells Part of the Story"

IMPERIAL Lubricants

For gasoline-burning engines— automobiles tractors, trucks.

IMPERIAL POLARINE AND IMPERIAL POLARINE HEAVY

For motors requiring an unusually heavy oil.

IMPERIAL POLARINE A

IMPERIAL PRAIRIE HARVESTER OIL HEAVY

For worn and loose bearings—a thick oil.

IMPERIAL ELDORADO CASTOR MACHINE OIL

For steam cylinder lubrication—tractors and stationary engines.

IMPERIAL CAPITOL CYLINDER OIL

For stationary and portable engines using either kerosene or gasoline.

IMPERIAL STANDARD GAS ENGINE OIL

For grease cup lubrication—a clean solidified oil.

IMPERIAL ARCTIC CUP GREASE

Made in different consistencies.

Imperial Farm Lubricants are sold in 1 and 4 gallon sealed cans, half-barrels and barrels.

THE fluidity of oil—its body or viscosity—has a lot to do with a machine's performance.

The ease and quietness of a motor's operation, its power, the wear-and-tear on moving and engaging parts, shafts, gears, valves, cylinders, etc.—all are affected by the body of the oil under operation conditions. Oil governs the machine's ability to do its work well, and determines its useful life.

Imperial Farm Lubricants have been developed to meet the requirements of every machine used on the farm. For each type of machine, fuel and service condition, we offer a carefully formulated lubricant that has been thoroughly tested and proved under operating conditions.

To make sure you are using the oil best suited to your automobile and your tractor, consult the Imperial Charts of Recommendations—on display wherever Imperial Lubricants are sold. When in doubt, consult the Imperial Oil Man; or write us.

PREPARE FOR HATCHING BY SELECTING BREEDING PEN FROM BEST LAYERS

In order to derive the maximum results in breeding we must get the birds in proper condition some time before the hatching season arrives. The pens must be mated up several weeks in advance of the time hatching eggs are desired, and other details that tend to affect breeding conditions must be carefully looked after.

It should be our desire and aim to secure a high per cent of hatchable eggs—eggs that will produce vigorous, livable, chicks. It is an easy matter to raise to maturity chicks that come out of the shell with a kick—chicks that abound in health and vitality. But it is an extremely difficult task to raise those that have difficulty in breaking through the shell and have not the vitality to stand a little rough handling and adverse weather conditions.

In selecting our breeding pens the first consideration should be vigor. No fowl can stamp vitality and laying ability in the offspring if constitutionally weak; only vigorous, robust stock can do this. But, in selecting the breeding stock from the standpoint of health we should judge the stock not only from the present physical condition, but from the condition of its health since the time of hatching. We must consider the development of the fowls from the time the chicks were hatched. Certain conditions often affect the growth of the chicks, which arrest development for a short period. Recovery is made later and seemingly the birds have not suffered from the effects. However, such conditions are not natural and birds affected in this manner should be discarded from the breeding pens. The forcing they have undergone to make up for their setback earlier will probably give them the size necessary, but certainly leaves them in a weakened breeding condition and they will not prove good breeders. Disease germs can be dormant for a time and then become active again. Therefore it is best to err on the side of safety by using for breeders only such birds as have developed naturally and steadily without forcing from the day of hatching. The birds that have not developed in this manner may be kept for the production of table or market eggs, provided they can produce a sufficient number of eggs to prove profitable, but by no means should they be used as breeders and thus perpetuate their faults in their offspring.

Choosing by Conformation

The birds should be as large as the breed calls for, typical of the variety they represent. They should not be too large, however. Stout legs, broad skulls, bright eyes, broad, strong frames, are indications of strong constitutions and vigorous breeding condition. On the other hand, birds with snaky heads, knock knees and long narrow frames must not be bred from. Such specimens are positive indications of weak, inferior condition, and all such birds should be fattened and marketed.

The beginner in poultry raising is usually desirous of knowing how soon after the pens are mated up one can secure hatchable eggs. We usually can expect good fertility after the male bird has been with the hens ten days or two weeks, although to be certain that we should obtain a high per cent. of fertile eggs we should wait three weeks. The best results can be obtained, I believe, when we have two male birds for each pen, using them alternately. When this method is adopted the male birds remain in a more vigorous condition and are more capable of stamping stamina and vitality in the offspring. Continual use of one male bird has a tendency to weaken his reproductive power, and later in the season we will find fertility and hatchability lessened to a great extent. By using two males, this can be overcome, for both will remain in top-notch breeding condition. The change can be made each evening, thus giving the one male bird the run of the pen the entire day, while the other is cooped up. This method also assures that each male will conume the food necessary for his well being; for we find in some cases that the males are so gallant as to refuse to eat, preferring to have the hens get the food. Fifteen to twenty hens can be in the pen with the best of results.

Feeding Breeding Stock

The feeding of the breeding stock also must have careful consideration. It is just as necessary for the breeding hens to be fed for fertility as it is for the laying hens to be fed for egg production. A hen intended to be bred from should not have foods similar to a hen kept for laying only. Our aim should not be to see how many eggs we can get, but how to keep the hens in a vigorous and healthy state. Forced egg production will sooner or later affect the hen's reproductive ability and even cause a complete breakdown. To avoid this keep the hens laying naturally and steadily by supplying

the proper housing conditions and an abundance and variety of good wholesome feed. Under no conditions resort to spices or condiments in an effort to stimulate heavy egg production. It is all right to use a little condimental tonic just before the pullets start laying to encourage them to start in, but by no means make a practice of it. Good feed and good care should keep them going nicely after they have once started in.

Exercise care in selecting the hatching eggs. Never take the eggs for incubation just as they come from the nest, paying no attention as to whether they are full-sized, perfectly constructed, etc. Never use for hatching, eggs that are of unusual size or shape, or that have imperfect shells, such as spotted, thin, or ridgy shells. Thin-shelled eggs are likely to become broken and the contents run out and cover the other eggs and endanger the hatch. Soft-shelled or thin-shelled eggs are usually the result of a lack of shell-forming material. A supply of crushed oyster shells will usually remedy the trouble. Thin or porous-shelled eggs seldom hatch well, as they permit of too rapid evaporation of the moisture content of the egg. Porous-shelled or thin-shelled eggs and those with other imperfections not outwardly visible will show up under the tester and all eggs should be tested before being incubated. All imperfectly formed eggs should be culled out and used for home consumption.

O. E. HACKMAN.

AVOID MEDICINES

Some poultry raisers are getting into the habit of continually putting medicines in the food or drinking water of their fowls. They imagine it keeps away disease and makes the fowls do better. As a matter of fact, there is no more sense in it for fowls than for human beings.

The way to keep any creature healthy is to provide good living conditions and good food, with sunlight and exercise. If that will not induce a fowl or animal of any kind to remain healthy nothing will.

Of course fowls are always liable to get "off their feed" or become ill with some ailment that requires the temporary use of medicine. But there is no use to dope healthy fowls and there is no use to keep it up on sick fowls after their recovery is complete.

Tonics and "egg layers" are stimulants and should not be used to excess. If one feeds them it should be with the full knowledge that for breeding fowls and all-the-year-around health and productivity the best guarantee is good food, good care and good quarters.

S. P.

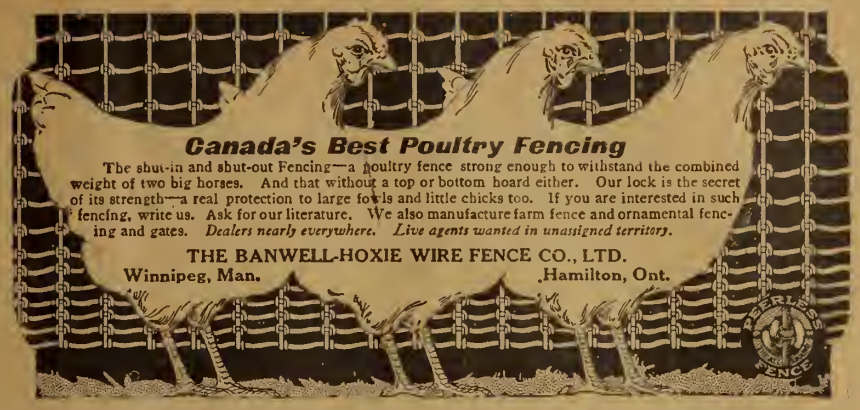
FLOOR SPACE PER BIRD

The amount of floor space required per bird depends upon conditions. Where fowls are confined during the winter months, an allowance of at least four square feet should be made for each bird; but where the fowls are on free range, the amount of floor space is not so important. A minimum allowance would be about two square feet per fowl. Some careful poultrymen are able to crowd a great number of birds into a small compass and have them do well, but in such cases the operator is "onto his job" and makes provision for all the wants of the birds. To the average man, it is better to have too few rather than too many fowls in a given space.

A pen 12x12 feet on the ground will easily accommodate from 25 to 35 laying hens during the winter, and if the operator is very careful to keep the quarters clean, provide deep litter, and feed a good ration, as many as 50 laying hens may be comfortably kept in such a house.

BREEDING MALES

In selecting males to head our breeding pens, we never give the preference to size alone, as size may be due to



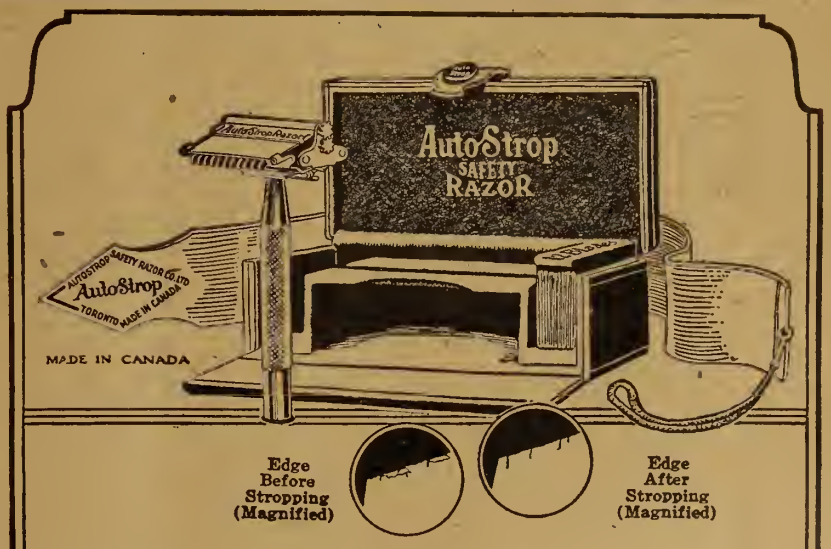
Canada's Best Poultry Fencing
The shut-in and shut-out Fencing—a poultry fence strong enough to withstand the combined weight of two big horses. And that without a top or bottom board either. Our lock is the secret of its strength—a real protection to large fowls and little chicks too. If you are interested in such fencing, write us. Ask for our literature. We also manufacture farm fence and ornamental fencing and gates. Dealers nearly everywhere. Live agents wanted in unassigned territory.
THE BANWELL-HOXIE WIRE FENCE CO., LTD.
Winnipeg, Man. Hamilton, Ont.
BANWELL HOXIE FENCE

fat and idleness, writes an experienced poultry breeder. The main male points are shape and color and a bird that is active and of medium size. Size in chicks is mostly inherited from the female side of the mating, while shape and color are largely determined by tre male.

A little practice and observation will enable you to make a selection without difficulty, but many persons are so partial to large males that they often sacrifice their best interests in other directions. If the males is pure-bred, you will secure chicks of good size from a medium-sized bird mated to fairly large hens. This is better than to use a male so large he is clumsy.

THE OVERFED CHICK

Overfeeding seems to be one of the evils that is usually indulged in when feeding the brooder chicks. Especially is this the case with beginners. They are prone to fear the chicks are not getting enough, and therefore are continually stuffing them. As a consequence the food lies around uneaten, becomes soiled and filthy and unfit to be eaten. Chicks fed in this manner often contract bowel trouble and even more serious ailments. It should be more generally realized that chicks require no food whatever from thirty-six to forty-eight hours after hatching. Nature has provided for them during this time by the absorption of the yolk into the abdomen. To stuff them with food before they are in condition to assimilate it is to invite trouble. One cannot go against the laws of nature. Water, however, may be provided the first day.



Edge Before Stropping (Magnified)

Edge After Stropping (Magnified)

EXPERIENCE shows that only a sharp blade can give a perfect shave, also that a blade cannot remain sharp without stropping. Couple these facts with the further fact that the AutoStrop Razor is the only safety razor that sharpens itself, and you will be in no doubt as to which safety razor to use.

Any dealer will gladly demonstrate the AutoStrop Razor to you, guarantee satisfaction, or refund of purchase price.

Only $5.00—complete with strop and twelve blades in an attractive assortment of cases to suit any purpose.

THE BOW ARM.—THE STORY OF A LITTLE GIRL WHO RAN AWAY FROM FAME

(By Annie Hamilton)

"YOU better be glad"—Virginia's pointing forefinger aided her little sighing voice—"you better be glad, Nobilissimus, that you haven't got a bow arm."

She lifted a small, soft paw and brought it into range of his vision. "This would be it, if you had one," she said explainingly. "You couldn't catch flies with it, or rats or anything. They won't let me."

The shouts of a rabble of children filtered through the vines to them. Virginia's ear turned to delicate melodies, refused to recognize discords here. She said stiffly to herself that it was a beautiful sound.

"They flat a little," she acknowledged; "but I like the sound of it, Nobilissimus," appealing again to the little dun-colored dog. "If we did that folks would all come a-flying, woudn't they? Mother and Mademoiselle and Janice and Aunt Chlo, every single. The vision of Aunt Chlo "a-flying" wheezily in the rear improved Virginia's spirits. Visions of Aunt Chlo had that tendency always. Undefined but ever present in Virginia's consciousness was the suspicion that Aunt Chlo would never have come a-flying at all of her own accord. She of all the chid's corps of guardians recognized the child's extreme youth and coveted for it is own. Yet Aunt Chlo, black and massive, had been schooled successfully.

"Yo' po' little lamb!" she pitier, and in the same breath, "Don' yo' go carousin' roun' or yo'll hurt yo' bo' ahm!" It had to be. Virginia herself on all but rare occasions accepted the decree.

This was a rare occasion. Rebellion bit at the child's soul, and in the smart of it she writhed feebly. Away off on her little horizon she had long ago descried a cloud the size of a man's hand. It was slowly growing larger; today it was the size of Aunt Chlo's hand. When it grew very big indeed, somesting would happen—oh, something that would bring them all a-cying. Virginia clasped delicate white fingers around her knees and sat and saw it coming. From the solemnity of his attitude the little dun-colored dog might have been sitting that way and seeing, too.

But it would not come today. Today was a holiday. On holidays Virginia only practiced an hour and a half. Her lessons with Mademoiselle were excused. There was leisure to sit like this, out on the porch with Nobilissimus, and listen to the rabble of joyous children. On days that were not holidays Virginia practiced four hours.

The next concert was a very little way off now. Virginia got up at the rememberance of it and went upstairs to look at it, the little dog a-heel. New dresses recompensed so much, especially this new one, which seemed to Virginia softer and daintier and lovlier than any of its predecessors. She gloated over it in a rapt, miserly little way.

"This is how I shall bow, Most Noble"—the little dog was designated impartia in English or Latin—"Like this—and they will all clap their hands. You ought to hear them clap their hands when I bow! And when I get through playing—" The child's eyes took on triumph. Dreaminess crept over her small sweet face. She was in the beautiful new dress, looking down, not at the patient little creature at her feet, but a sea of smiling faces. Ripples of applause ran over the sea—the people clapping. She smiled in shy response. The old intoxication went to her head like wine.

Unconsciously her small body straightened, her chin lifted, she nestled under it an imaginary violin. Her sacred little bow arm swept back and forth over imaginary strings. And the little dun dog, because he was Most Noble, listened patiently in his trying role of smiling sea.

Something stirred behind Virginia and she swept about to face a laughing maid.

"Janice!" She stamped her foot imperiously, "you've been there a-listening."

"You played beautiful, Miss Virginia," with spurious gravity.

Virginia's stormy mood was snuffed out in a sudden little gale of merriment. It must have been funny to Janice.

I'll play you some more," she cried, and nodded and smiled and played. But the maid interfered in alarm.

"No, on, don't, Miss Virginia, you musn't. You'll get tired out and you're—you're wasting your arm."

"It's my bow arm," Virginia retorted grandly, but she let it fall to her side. "I'l stop, though, because I want to. Janice, am I lovely?"

"Dear, yes." Janice was taken off her guard, but ready.

"Am I remarkable?"

"Dear, yes!" This answer was serviceable while casting about for a better.

"Can any other little girl like me play at concerts and be clapped?—can your little sister?"

"My litte sis—" Janice gasped at the thought. "No. oh, no, Nelly can't —no indeed."

"What can Nelly do?"

What could Nelly do? Run and leap and swing her arms, unafraid—

Her bow arm?" persisted Virginia. "Will they let her swing that one and do—do stunts with it?" She had picked up the word at some unguarded moment.

"Dear, yes, anything, Miss Virginia."

"Then I suppose she isn't valuable. It must be nice not to be valuable. Just a litte girl and your bow arm just an arm—but I don't suppose she has lacy new dresses every time she pl—she doesn't play? Like my new one, Janice.

The expression on the face of the maid hurried from chagrin to tenderness. Nelly in a lacy dress! No, no, Nelly never had any new dress.

"She wears mine made over," Janice said simply.

"But she has good times?"—and laughs?" Virginia was oddly persistent. Yes, Nelly had good times and laughed. Janice laughed in sympathy.

"I wish you could hear her, Miss Virginia!"

"Oh, I wish I could!" cried, sick with longing, the child who played at concerts and was clapped. The cloud on her little horizon grew larger than Aunt Chlo's big black hand.

* * *

HER name on a programme was spelled Virginie and looked beautiful. There were strings of programs hanging by their silken tassels on Virginia's walls, and sometimes when she was very tired and her bow arm ached especially hard she peeped into them, one by one, and found the Virginie. It was a help, like looking at the new dresses and remembering the clapping.

On the day but one before a concert Virginia practiced six hours, three in the morning and three in the afternoon. Her master came and practiced with her and Mother stayed in the room and gave her spoonfuls of things out of bottles to give her strength. There was always a strange excitement in the air. On the day but one before a concert Nobilissimus kept his tail much between his legs and stayed under things.

On the day before there was no practicing at all. Janice lowered the shades in Virginia's room to keep her asleep in the morning, and everyone went through the halls and up and down staairs softly. Aunt Chlo brought in bowls of steaming things as soon as the child got up and took her on her knee and fed her out of them like a baby.

"Po' little lamb! Po' little lamb!" Aunt Chlo crooned.

Then came the day itself and the journeywith Mother on the cars, with the smart little violin case on the seat between them. That was Virginia's best day. Her cheeks were pink and her eyes shone with excitement; the clapping was already in her ears.

On this particular best day the child dozed intermittently while Mother talked to someone behind in a proud voice. Virginia caught snatches of what was said, but she thought she dreamed them.

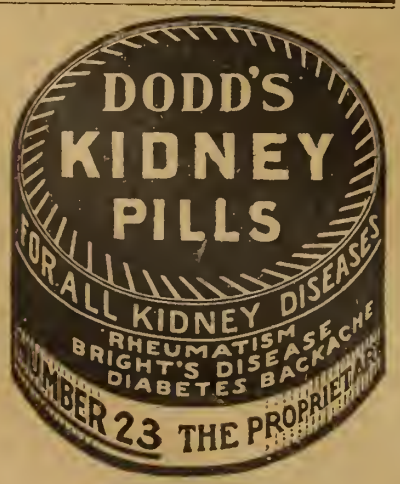
Only nine—yes. She has played ever since she was five. . . Oh, yes, of course, she practices a great deal. . . . Oh, no, she does not mind it at all. . . Yes, the most difficult. Her repertoire is remarkable for a child."

The other voice was too low to get into Virginia's dreams. The spaces between the things that Mother said were empty spaces. Suddenly Virginia sat up and knew she was awake. This was no dream.

Yes, four hours now, but her master says we must soon be making it five—then six—increasing as she grows older. It has to be—ah, do you get off here? I wish you were going to hear her play."

"Five—then six—increasing" — Virginia stared blankly into a dreary future. Her poor little bow arm throbbed in self pity. Een the glamor of the near future—of tonight—faded into insignificance. The beautiful new dress, the smiling faces, footlights, clapping hands—they dimmed and disapepared. The rattle of the train beat out "Five—then six—increasing," in her ears."

Villages and scattered homes flashed by her window. Everywhere there seemed to be little children romping and laughing and swinging their arms



MAGIC BAKING POWDER

Contains no alum

We unhesitatingly recommend Magic Baking Powder as being the best and purest baking powder possible to produce. It possesses elements of food that have to do the building up of brain and nerve matter and is absolutely free from alum or other injurious substitutes.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight aud dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home. without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall ouly ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

MRS. M. SUMMERS, Box 309

Read My FREE Offer

To Mothers of Daughters. I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten day- trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

Windsor, Ontario

like Nellies. None of them appeared to have bow arms. They must all be Nellies.

On Virginia's horizon the cloud was ominously spreading. By the time the end of the journey was reached it enveloped her little world. What had been coming all this while to Virginia was now all but here, separated only by the little space the concert must occupy. After that—

"As soon as I get home—" the child reflected with the temerity of despair. "I can't wait any longer than that."

She would take Most Noble with her. In her heart was born a wistful premonition that Most Noble would be the only one who would really care, and so she could not leave him behind. They would go together hand in hand, Virginia thought.

Mother and Mademoiselle and Janice and Aunt Chlo would be a litte sorry on aacont of the wasted little concert dresses and the wasted violin. It would seem queer to them all not to have anyone to run about after and keep from injury—not to have any bow arm to take care of.

Virginia had never laid up against anyone her weary hours of practicing; as Mother had told the strange person on the train, it "had to be." You never laid up things that had to be, you only ran away from them.

* * *

THAT particular concert was always a good deal like a dream to Virginia; not an unpleasant dream, for there were the lights in it and the flowers and a beautiful sound of clapping, but a misty, elusive one that refused to stand out clearly against the background of her memory. It seemed always to have been some other child that stood on the edge of the smiling sea and nodded and lifted a small round chin—someone else's little bow arm that swept the bow across the strings. She herself stood off a little way and pitied the child that was playing and laughed elfishly to think they were going to make her practice five hours soon—then six—increasing.

Virginia decided on the very morning after she got home as the time to do it. Fortunately for her, the difficulties in her way were materially lessened by Mother's lying in bed and it's sbeing a hoiday from lessons, which eliminated Mademoiselle. That left Janice to run away from and Aunt Chlo. But Janice, it came about, had a toothache. Hence, of Virginia's row of "blackbirds" in her way one flew away and another. Then there was one—Aunt Chlo, very black indeed. To eliminate Aunt Chlo with least trouble Virginia had recourse to artifice.

"Aunt Chlo," she asked with sweet solicitude, "how is your misery?"

"Bress yo' heart," honey," groaned Aunt Chlo, searching out a promising spot and rubbing it, "it's a-takin' holt ag'in dis mornin'!"

"Then I guess you had better not sit out on the porch in the—the draught. I'll take the teeny silver bell and ring it if anything happens to me. You stay in here by the fire and keep your misery warm.

The artifice succeeded. Virginia, with a little nightgown in a roll under her arm, and Nobilissimus, without his, stole guiltily away. They hurried until they were out of sight of the house, and then settled into a steady little jog. Neither of them spoke till more than a mile had slipped under their six trudging feet. It was Virginia who spoke then.

"Ill ring the teeny bell," she laughed, "for something's happened now!—I said I'd ring it if anything happened to me. Nobilissimus, we're running away! It feels a little queer to be, doesn't it?"

* * *

JANICE had so often described her home a few miles out into the country that the child had no difficulty in finding it. There were so many things to go by. There was the blue pump—very blue, Janice said—and the red barn with a fish on it, that swam north, east, south, west. Virginia stopped at the first red barn with a fish on it, swimming west. And it was the right place for there was Nelly with Janice's good round face!

"Here ye are—we've got here, Nobilissimus!" the child cried excitedly. She advanced toward a shy, brown chid and made her little concert bow.

"How do you do, Nelly?" she said in her gracious little way. "I've come to live with you. What shall we play?"—For she wanted to lose no time. She had many little programs in her mind of the things—the Nelly-things—they would do. She realized most of them, if not all, would require practice, but she was used to practising. Her name in all these programs was spelled Virginia and looked beautiful.

"I'm Virginia—Virginia—" she hurried as a necessasry sop to the other child's bewildered curiosity. "The one that Janince sweeps and dusts. She said you had good times and laughed—so I came. I wish you'd laugh now." And Nelly, after another astonished instant, obeyed. It was splendid."

"That's one o, the things I came for—to learn, you know—and another's trees," Virginia explained. "Janice says you can climb ,em."

"My gracious!" laughed Nelly, unable to stop. "Me climb trees!"

"Oh, can't—you?" disappointedly. "Then I suppose it was something else Janice said, but I understood—"

It was rather a tall tree with the playhouse titing in its midst. To Virginit it was a Calfornia giant, but when she had climbed it and sat up there among the leaves she would be a Nelly!

"Come on! Come on!" she revelled. "You go ahead first and then me."

It seemed scarcely a moment before she lay in the long grass at the foot of the giant tree with Janice's Nelly stooping over her, her little brown face whitened by fright.

"What is it? What did I do?" Virginia murmured. She felt queer. The little white-brown face was two faces—three, four, five—above her. She thought of the teeny silver bell. She ought to ring it—something had happened to her.

"You didn't know how—you fell out," all five Nellies sobbed above her. All five were blanched and scared. "You've got to get up and come into the house with me and see mother. Give me your hand, I'll help you."

"Don't!" shrieked Virginia, and the new thing that hapepned rent her with grinding, awful anguish. Then merciful oblivion.

They told her when she awoke that she had broken her arm, and they had sent for the doctor and her folks. She must lie very still until they came.

Oh, yes—oh, yes, she would lie very still. The room seemed full of pain and she did not want it to come any

KING COLE TEA
"You'll like the Flavor"
The Big Value Package that is Guaranteed.
Perfectly packed in bright lead foil, and price marked on every package.

When Your Liver Becomes Sluggish

Your Bowels Become Constipated.

Constipation is, without a doubt, the commonest of all the ills that mankind is afflicted with, and one if neglected, will cause no end of trouble and sickness.

The way to keep yourself in good health is to keep the liver active and working properly by the use of Milburn's Laxa-Liver Pills.

Mrs. L. Wainman, Orillia, Ont., writes:—"From a child I was always very badly constipated, and I can well remember, when quite young, my mother giving me senna tea nearly every morning, and I got to dread it.

"After taking Milburn's Laxa-Liver Pills for a while I am not troubled with constipation any more."

Milburn's Laxa-Liver Pills are 25c. a vial at all druggists or dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

nearer. Moving she was curiously certain would bring it close. She wondered a good many things while she lay still—when they get there, what the doctor was coming for, but most of all which arm.

* * *

THEY took her home after rather a weary while, and she spent her time in her own beautiful room with Mother. It was a surprise to Virginia to have her Mother there so much. The surprise grew into comfort. When she caught Mother's eye, Mother smiled—Virginia thought it a beautiful smile.

"Shall I begin to practice tomorrow?" Virginia said one day. It seemed a great while after the accident. She was facing Mother and saw plainly the look that came into her face, but it was not a plain look. Virginia could not decide what it meant.

"Not tomorrow, dear," was Mother's smiling answer. "Dear," was another surprise that was growing into a comfort.

"I'd like my violin. Please bring it Janice," she said. And to her surprise the maid burst into tears. The next time she asked Mother for it.

"Dear," Mother did not smile at all, "there was a little girl once who broke her arm."

"Yes," nodded Virginia, but there did not seem to be much relevancy in it. "It was me."

"Her bow arm," Mother added gently. "It was a pretty bad break, Virginia. And—and the doctors said it would always have to be a stiff arm—as long as she lived.

Virginia sat up from her cushions. This was something that could not be realized lying down. Even sitting up it was very hard. It took a number of minutes. Realization filtered into the child's brain, drop by drop. When it was all in, she tturned a white, shocked little fcae to Mother's white, shocked face.

"Please bring it to me," she mhispered as people whisper when some one is dead.

And when Mother brought it in its smart little case: "Now please you and Nobilissimus go," she whispered. With her left hand she took out the little violin and raised it awkwardly to its old place.

"Why!" she said softly, "why, it seems queer to be sorry! It's squeer not to be glad. You, you dear, you're dead now, aren't you, and pretty soon I'll put you back in your poor coffin. But I want to say something first. It was you I ran away from, and—I wish I hadn't! I never suspected I'd wish that. I tseems queer doesn't it? And—and I'd like to practice five hours on you—six—increasing. Oh, you dear, I think I'm going to cry!"

She hurried the little instrument back in its scoffin and shut it in. One minute she laid her cheek against the smart litle case.

"Good-bye," Virginia whispered.

Says She Cannot Praise Them Enough

MRS. GAUVIN TELLS OF DODD'S KIDNEY PILLS

She Says Her Back Was So Weak She Could Hardly Walk, But Now She is a Different Person.

St. Jeanne d'Arc, N. B., Mayy 11th. (Special)—Among those in this neighborhood who are enthusiastic in their praises of Dodd's Kidney Pills is Mrs. Joseph Gauvin, a highly respected resident here.

"I cannot praise Dodd's Kidney Pills .enough," Mrs. Gauvin states "My back was so weak I could hardly walk. I took six boxes of Dodd's Kidney Pills and now I feel a different person.

"Dodd's Kidney Pills have done me a tremendous amount of good."

Of the many person paying their tribute of praise to Dodd's Kidney Pills, it is noticeable that the great majority are women. The reason given for thisis that the great majority of women's ills come from the kidneys. Dodd's Kidney Pills act directly on the kidneys. Healing and strengthening them, they enable the kidneys to strain all the impurities out of the blood. Pure blood is the foundation of health.

Asks youd neighbors if Dodd's Kidney Pills do not help weak or sick kidneys.

A MODERN KITCHEN

Man works from sun to sun, but woman's work is never done." So they truly say, but whose fault is it? Wherever man has taken up woman's work he manages to quit when the sun does, either by leaving many ceremonies unperformed or by making them less intricate. They have enough of the masculine to keep household duties in their proper perspective, which means making dust-rags, dishpans and scrubbing brushes the servants instead of the masters; for it is an admitted fact that to the average woman the house is a sort of heathen idol, which must be appeased at any cost, even though health and happiness lie crushed beneath the wheels of its chariot. It is a good thing to know how to make bread, but a better thing is to know when not to.

How often we hear from feminine lips, "What a nice large kitcen," or "what a horid little tucked-up hole!" Some of the ancestral kitchens were huge affairs, adjacent to a dining-room equally monstrous. Anyone to live and work there must be a good walker, for the sink was in one corner, china closet in another, and the range in the middle of the room. A boy in whose home was such a kitchen, remarked when the maid left, that it was probably because she had worn her feet off to the first joint galloping from place to place in vast domain. And who knows but this is the reason women are shorter than men? They wear off faster than the can grow, trying to get food enough, to the far-distant table, to fill four or five boys, to whom they refer on occasions as "bottomless pits." To the woman so situated, a walk around the world would be a mere pastime.

A radically modern and sanitary kitchen is small or medium-sized, well lighted and with a special ventilating window near the ceiling. First let us consider the kitchen floor. Hardwood is nearly always the first choice. If it is to have hard wear there is nothing better than boiled linseed oil, properly applied. These can be cleaned with kerosene or washed in soapy water. If it does not have hard wear, a thorough oiing and three coats of varnish make a nice finish and one very easily cleaned. A good quality of linoleum makes a nice covering. Some prefer the hardwood patterns in linoleum, but any neat, little pattern is suitable, but it must be light in color. Linoleums are soft under the feet and very sanitary . Small rugs on the floor will save tired feet, but they should be such as can be "tubbed" frequently.

Next comes the walls. These may be sealed or plastered. I prefer the plaster. This can be painted and varnished and is not easily marred and very easy to wash. A good many housewives prefer paper for the kitchen walls. Papered walls are not sanitary; a spatter can be washed from a painted wall but cannot be removed satisfactorily from a papered wall. Care should be taken in selecting either paper or paint. They should be light in color and pleasing to the eye. Most housewives find the old-fashioned, white washed ceiling the most practical for the kitchen.

An axioum in the model kitchen is, "a place for everything," which means room enough for everything to have a place and no room wasted. All utensils of labor should be kept out of sight as much as possible. The range should be placed so as to ge within easy reach of sink, table and cupboard, and in a good light. A small shelf within reaching distance

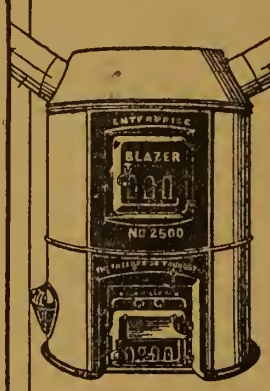
Pure Air is as Necessary as Pure Food

THE ENTERPRISE BLAZER FURNACE heats your home in Nature's way. It draws in the sweet pure air from the big outdoors, moistens it thoroughly, turns it into heat and comfort and passes it on to every corner of your home.

The best that base burners and radiators can do is to heat the air that is already in the house—that has been breathed again and again. Stoves choke the air with dust and in real cold weather they fall short of their job. Another reason for the

ENTERPRISE BLAZER WARM AIR FURNACE

is economy. For thirty-five years we have been learning how to take all the heat out of a piece of coal; and then how to make most use of it. The Enterprise Blazer is the result. And it costs a great deal less to install than a hot water boiler, pipes and radiators.



An Enterprise Blazer will wear for years and years. Every part is made a little better than it need be, and it carries the famous Enterprise guarantee of satisfaction. Get your dealer's advice and write us today for our free booklet "Warmth and Comfort".

MINARD'S LINIMENT

King of Pain

The old reliable remedy for Rheumatism and Neuralgia, Sore Throat, Sprains, Strains, Swelling of any sort and Bruises

RELIEVED THE PAIN

Miss Ruth Tarkington, 12 Trafalgar St., St Thomas, Ont. "My grandmother was subject to rheumatism and used to call me from my playmates to go to the druggists to get Minard's Liniment. I was often unwilling and declared I hated that old stuff, but I soon found out how good it was. I got neuralgia. Grandma came with the Liniment and applied it to my head and I was very much surprised to feel how quickly it relieved the pain."

Minard's Liniment Company
Limited
YARMOUTH NOVA SCOTIA

NO WOMAN

CAN BE STRONG AND WELL WITH WEAK KIDNEYS.

Women try to bear the daily burdens of the household, but the continual stooping, bending, never ending strain on the back, sooner or later, may end in some form of kidney trouble.

When the back aches or becomes weak it is a warning that the kidneys are affected in some way, and on the first sign of any weakness Doan's Kidney Pills should be taken, so as to strengthen the kidneys and prevent some future trouble.

Mrs. Joseph Jarvis, 152 Niagara St., Hamilton, writes:—"I was so troubled with my kidneys I could hardly sleep; I could not do my work, and was a burden to myself. I used Doan's Kidney Pills and they sure helped me, and I would not be without them in the house. I can sleep better now than I have for years."

Doan's Kidney Pills are put up in an oblong grey box; our trade mark a "Maple Leaf"; price 50c. at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

of the range holds salt, pepper, sugar and other seasonings used in cooking vegetables and meats. A zinc-covered, hinged shelf should be very near the range, where hot dishes, pots and pans can be set.

Every kitchen ought to have a sink and every sink a draining board. The sink should be near the working-table and sufficiently high to do away with the back-breaking position from which we may have suffered for years. Beneath the sink are hooks for sauce-pans and beneath the draining-board a few small drawers, for utensils needed about the sink. The pot closet should be near the range and one that you can step into with hooks for hanging cooking utensils on the walls and a high shelf for "covers" for these pots and pans.

A kitchen cabinet is very useful, but if one cannot be obtained, a home-made cupboard will answer the same purpose. One side of this cupboard should hold the mixing pans and bowls, the other side dishes needed about the kitchen. These cupboards may have glass doors and should be tastefully arranged. Movable shelves enameled in white are very convenient for these cupboards. Drawers fill the space below; one holds kitchen towels, another dishe towels, another kitchen aprons, and a fourth paring knives, spoons, etc., each in their proper compartment.

A shelf over the table is convenient for spices. On one end of the table should be placed the food chopper. It can be taken off and cleaned and put back so as to be ready when again needed. The table should be fitted with castors and of the proper height. In a box fitted with castors and with a hinged lid, we find everything necessary for washing except the tubs. This may be kept in the shed and rollled in and used as a bench for the tubs while washing. Two shelves placed one over the other in some out of the way corner, have holes bored in them. In these we stand the brooms, mops and brushes needed for cleaning floors. A closet between the dining room and kitchen will be found convenient when cleaning the table after a meal. The ordiary slide with a shef on oone side will save a number of steps.

Kitchen Windows

The windows of the kitchen should be screened their full size and fastened on the outside so that the windows may be raised or lowered at will. The outside door must also be screened.

The kitchen costume should be light in color and washable. Ordinary work aprons may be dark if desired, but cooking aprons should be either pure white or of very light color, otherwise the cook might possibly appear at the door with patches of flour adorning her otherwise spotless attire.

Long-Standing Evil

Effective Measures Taken

Since childhood Mr. A. Cail was under the shadow of a great evil, which always menaced his comfort and safety. Read what he says:—

"I was troubled with my kidneys since childhood and spent a large amount of money trying to get cured. Instead of getting better, I kept getting worse until a friend of mine advised me to try Gin Pills. I did so, and after taking one box, I was able to get out of bed and walk around. Two more boxes relieved me completely, and since then I have had no return of the trouble."

Many people have kidney and bladder trouble without knowing it. They think nothing of the backache, the pains in the sides, the constant headaches, the rheumatic, sciatic and neuralgic pains, the floating specks before the eyes, the swollen joints, the highly-coloured urine—all signs of trouble—all signs which should receive immediate attention and treatment with Gin Pills, which are by far the most effective of all preparations, and which may help you to avoid a fatal operation. They quickly relieve pain and heal the congested tissues, bringing the organs back to normal. At druggists and dealers, 50c a box. Money back if no relief. Send for free sample.

The National Drug & Chemical Co. of Canada, Limited, Toronto. United States Address, Na-Dru-Co., Inc., 202 Main St., Buffalo, N.Y. 252

MOTHS AND THE BEST MEANS OF ERADICATING THEM

There are two kinds of moths which have proved themselves enemies of the housewife—the clothes moth and the buffalo moth.

In May the clothes moth begins to fly about our rooms. It is a small, light, buff-colored miller, dainty and beautiful on close inspection. Its highest mission seems to be to teach us to set our affection only upon incorruptible treasures, which "moth and rust" cannot destroy. But it is necessasry to kep a sharp lookout for the safety of our ffurs and flannels. In the first place, we must carefully put away everything we can, upon which it will lay its eggs. If we pack away our furs and flannels early in May, before the moth has begun to lay its eggs and leave in boxes or bags so tight that the flying moth cannot squeeze in, no further precaution is necessary. Clean paper bags made for that express purpose. They should be without holes or openings anywhere. These bags when filled and closed firmly, may be put away on a closet shelf, or in loose boxes, without danger to their contents so far as moths are concerned, without need of moth balls or other strong odors to drive them away.

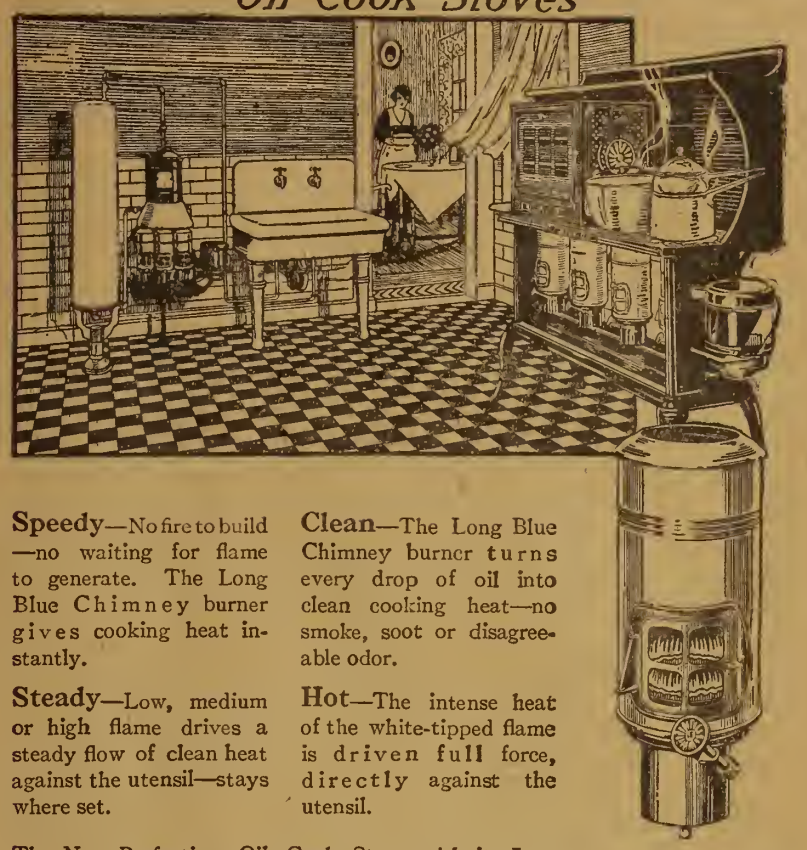
When putting away furs, beat them well. If you delay putting them away till June, examine the furs well, shake and beat them thoroughy in order that any moth eggs that may possibly have been laid in them may be thoroughly removed or killed. Woolen garments must be hung in closets through the summer, in parts of the country, where moths abound. They should be packed away in tight trunks or boxess, or sealed up in bags. Woolen blankets must be well shaken and carefully put away unless they are in daily use. Early in June the larvae of the moth begin their ravages, and then unless you dwell in places where moths are not found, look sharp, or you will find some precious thing that you have forgotten, already more or less riddled by the voracious moths. It is their nature to eat until they have grown strong enough to retire from the eating business and go into the chrysalis condition.

Worse still than the ravaging clothes moth, is, I believe, the buffalo moth, or buffalo carpet beetle. This beetle is originally a European insect, and is found in all parts of Europe. It is not really a moth, but the larves, or grub of a very small beetle. The beetle itself feeds on the pollen of flowers, and may be found in early spring in tulips and on other blossoms. From these, it flies into the open windows, and, dropping on the floor, proceeds to the nearest carpet or rug, or curtain, as the case may be, and deposits its eggs. From these hatch out the grubs familiarly known as the buffalo moth. The latter word is applied to them, no doubt, because the havoc they create is simiar to that caused by the ordinary clothes moth. The name buffalo is derived from the fancied resemblance of the grub to a buffalo. This is based upon the insect being broader toward the head, and covered with hairs.

The beetles are extremely small in comparison with the size of the grub and are really very pretty objects, being marked down the middle of the back with a broad line of red, and mottled with gray and white.. As they appear early in the season, it is advisable to put wire screens in the windows as soon as the weather permits of their being kept open. Once they have gotten in a house, it is a matter of constant viligance to keep them under contro, but by destroying all specimens that may be found, and from time to time overhauling fabrics that have been stored away, they may be prevented from becoming a serious pest.

In Europe, the insect is not especially noted as a household pest, and we are inclined to think that this is

NEW PERFECTION
Oil Cook Stoves



Speedy—No fire to build—no waiting for flame to generate. The Long Blue Chimney burner gives cooking heat instantly.

Steady—Low, medium or high flame drives a steady flow of clean heat against the utensil—stays where set.

Clean—The Long Blue Chimney burner turns every drop of oil into clean cooking heat—no smoke, soot or disagreeable odor.

Hot—The intense heat of the white-tipped flame is driven full force, directly against the utensil.

The Long Blue Chimney burner—gives speedy, steady, white-tipped instant heat.

The New Perfection Oil Cook Stove with its *Long Blue Chimney* takes up less room, banishes ashes, litter and dirt, and serves every cooking purpose all the year round.

Sold by all good dealers. Ask for demonstration of the Long Blue Chimney burner or write for Perfection booklet.

HOME OFFICE AND FACTORY

SARNIA - - ONTARIO

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me today for free trial treatment.

A MESSAGE TO WOMEN!!

Mrs. M. Summers, Box 309 Windsor, Ont.

The Joy of Living
Headaches are generally caused by nervousness or biliousness, and are very exhausting. They should never be neglected, but should be treated at once.
Dr. Wilson's HERBINE BITTERS
corrects the causes of headache, and restores that joy of living not known to headache sufferers. 51
At your store—35c. and $1.00.
The Brayley Drug Company, Limited
ST JOHN, N B

sssing to the fact that carpets are little used. It is a well-known fact that the carpet habit is a bad one from other points of view, and there is little doubt that if carpets were more generally discarded in our country, the buffalo moth would cease to be the prominent household pest that it is today. There is no easy way to keep it in check. When it has once taken possession of a house, nothing but the most thorough and long-continued measures will eradicate it. At housecleaning time, the rooms should be attended to one at a time. The carpets should be taken up, thoroughly beaten, sprayed out of doors with benzine, and allowed to air for several hours. The rooms themselves should be thoroughly swept and dusted, the floors washed with hot water, the cracks carefully cleaned out and kerosene or benzine poured into the cracks and sprayed under the baseboards. The extreme inflammability of benzine, and even of its vapor when confined should be remembered and fire carefully guarded against. Before relaying the carpet, tarred roofing poper should be laid upon the floor, at least around the edges, and when the carpet is relaid it is well to tack it down rather lightly, so that it can be occasionaly lifted at the edges and examined for the presence of the insect. Later in the season, if such an examination shows the insect to have made its sappearance, a good though somewhat laborious remedy, consists in laying a damp cloth smoothly over the spot and ironing it with a hot iron. The steam thus generated will pass through the carpet and kill the insects immediately beneath it.

Blankets, furs or other articles, that have been stored away for the summer, and found to be infested, should be put into tight chests or drawers and treated with bi-sulphide or carbon. This is a disagreeable smelling liquid, which should be poured into a saucer on the top of the contents of the box. This should be tightly closed up and left for forty-eight hours. The fumes being heavier than air, will penetrate everything contained in the chest, and will kill all the grubs and mothes that are among the contents. It is well to perform this operation in an outhouse, as the fumes of the liquid are very inflammable and explosive, and therefore it should not be used where there is any fire or light.

(Note.—Tight cedar chests are excelent for packing woolens in during the summer. In with the other articles smay be sprinkled moth balls, to be bought at any drug store, or a bottle of chloroform, uncorked, may be placed in the chest. Of course, in this case, care must be taken not to inhale the fumes when the chest is opened. Windows should be opened in the room before the lid is raised.)

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

MAPLE SUGAR RECIPES

Sifted pastry flour is used in these recipes. The cup is a standard measuring-cup holding one-half pint. All measurements are level.

Maple Biscuit

2 cups flour.
4 teaspoons baking-powder.
½ teaspoon salt
2 tablespoons fat
¾ cup milk.
Maple sugar

Sift dry ingredients together, cut or rub in fat, add milk gradually to make soft dough that can be handled. Roll out to one-half inch thickness, and cut in rounds. Brush half of them with softened butter or substitute, spread thickly with finely grated maple sugar, put together in pairs. Place in oiled pan, barely touching each other, and bake in hot oven.

Maple Cream Pudding

1 egg
1 cup sugar
2 tablespoons melted fat
1 2/3 cups flour
2 tablespoons baking-powder
2/3 cup milk

Sift baking powder and flour together, add sugar, then milk which has ben mixed with beaten yolk of egg, and melted fat. Beat well, and fold in the stiffly beaten white of egg. Pour into shallow pan, and bake in moderate oven. Cut in squares and serve them.

Maple Cream Sauce

½ cup maple sugar
1 tablespon white corn syrup
2 tablespoons water
1 egg white
1/3 cup thick cream
A few grains salt

Boil sugar, corn syrup, and water to soft-ball stage. Pour over stiffly beaten white of egg, stirring constantly. Cool and fold in whipped cream.

White Cake with Maple Frosting

¼ cup butter
1 cup sugar
½ cup milk
2½ teaspons baking powder
2 egg whites
1½ cups flour

Cream butter, add sugar, and beat until well mixed. Sift together flour with milk, to first mixture. Fold in stiffly beaten whites, bake in layer-cake pans in moderate oven. Put together with Maple Frosting.

Maple Frosting

Boil two cups maple syrup until it threads, add slowly to stiffly beaten white of one egg. eBat until cool enough to spread.

Maple Marguerites

½ pound maple sugar
¼ cup boiling water
1 egg white
1 cup pecan meats

Add water to the sugar, which has been broken or shaved as fine as possible, and boil to soft-ball stage. Add to stiffly beaten whites, beating hard all the time. Continue beating until stiff enough to spread. Add coarsely chopped nuts, and spread on unsweetened wafers or crackers. Serve with afternoon tea.

Maple Syrup Cake

½ cup shortening.
½ cup sugar
4 egg yolks
1 cup maple syruup
½ cup hot water
2½ cups flour
2 teaspoons baking powder
½ teaspoon soda
½ teaspoon mapleine
¼ teaspoon salt

Cream shortening, add sugar, beat well, add well-beaten yolks (two eggs may be used in place of the four yolks if desired), syrup, and hot water. Sift together flour, salt and baking-powder, and add to first mixture. Add flavoring, beat well, and pour into oiled pans to depth of one inch. Bake in moderate oven, and cover with Maple Frosting, or with Maple Fudge Frosting.

Maple Fudge Frosting

1 cup maple sugar
1/3 cup thin cream
1 tablespoon butter

Cut or break sugar in small pieces, add cream and butter, heat slowly, stirring until sugar is dissolved. Boil to soft-ball stage, about 240 degrees. Beat until thick enough to spread.

One Egg Maple-Chocolate Cake

1 cup sugar
1 teaspoon cinnamon
½ cup shortening, lard or vegetable fat
1 cup sour milk
½ teaspoon mapleine
1 tablespoon cocoa
Pinch salt
1 egg, well beaten
1 teaspoon soda
2⅛ cups flour

Mix sugar, cocoa, cinnamon and salt together. Cream with fat. Add egg, milk, soda, mapleine. Sift in flour. Beat well, put in greased tin. Bake in moderate oven. Chocolate or white icing makes this very delicious.

"AMHERST" SPECIALS
These two Slippers as shown in our illustrations cover fully thirty to forty lines in Theos and Slippers.
Leathers include Patent, Vici Kid, Calf and Side Leathers in Colors, Black, Grey, Mahogany and other Browns.
Turns, Goodyear and McKay welts.
We also show a wide range of Footwear for Infants, Misses and Boys, from comfy Bedroom Slippers in Felt to Fine or Heavy-Service leather boots.
Full and complete stocks shown at Amherst and at our Halifax Branch at 164-166 Granville St., Halifax, N. S.

FRESH AIR

A woman physician recently observed that in her opinion the worst

evil that has resulted from civilization is the habit of living in houses and sleeping in rooms. Hardly one of us gets all the fresh air needed to maintain the top-notch of health. The kitchen-gardening of the spring, summer and autumn does more for the gardeners than merely to furnish extra greens for the table. Women, particularly, are apt to stay indoors too much. For right living, three hours every day should be spent out-of-doors and the minimum to be tolerated is one hour of active exercise in the open air. Besides this, practise deep breathing before the open window; do not ride when you can possibly walk, and if you rent or build a house let a sleeping-porch be insisted on quite as much as a bathroom.

FOOTWEAR

Another physician says he hates to look out of his office window and see all the ill-shod feet carrying their owners to ill-health or invalidism before the middle years are passed. Here again wmen are the worst sufferers. Let us make it the fashion to wear an easy-fitting light-weight shoe, board-soled, low-heeled, as soft as a stocking, the kind of shoe you hardly know you have on, the kind that gives the sensation of winged feet and walking on air.

All the blood in the body has to circulate through these ill-used extremities of ours; we should not allow it to carry fatigue poisons from them to the rest of the system. Let us keep our feet at all times free and uncramped, let us keep them dry and warm and well ventilated. If you care for your feet as solicitiously as you do for your hands, if you refresh them with daily changes of stockings and more than one daily change of shoes, you will experience a generous return in giving ease, and lightness and joy to the whole body.

FASHION HINTS

Much taffeta is employed for spring frocks, as well as much foulard. The taffet frequently shows a glazed surfare—taffeta cire—and the foulard is patterned often very generously with color, although many of the smartset resigns are in black and white. Mohair will be used for summer cloaks—a coat of mohair or serge is smart over a foulard frock—and foulard frocks will be trimmed with serge.

Summer frocks will be made of crepe Georgette, voile, and organdy, as well as of Rodier's new cotton crepons and loosely-woven linens. Yellow, from palest lemon to deep orange, is smart this season, and a new dull rose shaded called mulberry is also featured. All the dull shades of rose and red are smart and are often prettily combined with dark blue—a frock of mulberry muslin, for instance being girdled with dark blue faille ribbon—and this rich, dark blue is also combined with yellow.

Hats of delicate straw for summer are trimmed with bright flowers, flowers and hat being often of one color. Thus a hat of yellow straw-and-wool braid is trimmed with vivid nasturtiums, and a hat of dull rose straw is combined with dull-toned pink roses. Roses dorn many of the hats this season.

Minard's Liniment Co., Limited.

I was very sick with Quinsy and thought I would strangle. I used MINARD'S LINIMENT and it cured me at once. I am never without it now.

Yours gratefully,
MRS. C. D. PRINCE.
Nauwigewauk, Oct. 21 st.

HOW COOKING MAY DETERMINE RELATIVE ECONOMY

Our war experience has taught us a new conception of the word "economy'—we think of it not as niggardly hoarding but as wise using. So our economy maxims might read—

Seasonableness Means Serviceableness—In other words let us not buy fresh peas or asparagus in January, but let us in June can our summer vegetables for January use.

Waste Brings Want—of vegetables as of other commodities.

"Extra Vegetables"—bought after the dietary is carefully planned are "wasted" unless carefully cooked to be served next day.

"Soggy" or Underdone Vegetables—are "wasted" as they tax digestion and do not give proper nourishment.

Careful Cookery of Vegetables May Save Meat—Since the flavor of a small quantity of meat may be "extended" by using nicely cooked vegetables as a basis for various attractive dishes.

HOW COOKING MAY AFFECT THE FLAVOR OF VEGETABLES

It may help the housekeeper if we formulate a series of maxims, a sort of Poor Richard's Almanac of Vegetable Cookery.

Serve Summer Vegetables Soon—after gathering.

Keep Winter Vegetables—in dry cold place.

Wash All Vegetables Well—with small brush kept for the purpose.

Sweet Juiced Vegetables—Such as celery, carrots or beets, should be cooked in small quantity of water.

Strong Juiced Vegetables—such as cabbage, onions and turnips may be cooked in larger quantity of water.

Add Salt to Water—When vegetables are about hal done. The proportion is one-half to one teaspoon of salt to each quart of water.

Color Will Be Kept—by cooking uncovered.

Wilted Vegetables—may be freshened by crisping in cold water.

Take a Cooking Time-table to the Kitchen—but remember it is only a general guide, the time varies according to age of vegetables.

Cook Fresh Vegetables Quickly—That is, in rapidly boiling water.

Simmer Dried Vegetables .Slowly—To soften fibre and thoroughly cook starch.

Season all Vegetables Delicately—Just before serving.

Serve all Vegetables Attractively—to "feed the eye."

SPRING FLOOR CARE

There is no floor covering that will prove more practical for the service rooms of the house than linoleum, but linoleum as a floor covering is in disrepute among many housekeepers because they do not know how to purchase, lay and care for it properly. In selecting linoleums choose the plain patterns only when the room is to be pretty well covered with rugs since a plain linoleum shows foot marks distinctly and is therefore harder to care for; but be just as careful in selecting a pattern that the large sprawly ones are passed by.

The next point to consider in purchasing linoleum is to be assured that you are buying a service that will ensure it to be properly laid. Complaints have reached us that linoleums are insanitary floor coverings, that they harbor roaches, and insects generally, and many a housekeeper for these reasons refuses to replace an old linoleum. But this condition could not happen if the linoleum had been properly laid as a floor and not as a floor covering. If your floor is a wood one, see that the surface is smooth and even. If it is not even there are two methods of renovating; one is the use of one of the electric floor scrapers or planers which will work off the roughness, and the second is the use of padding paper beneath the linoleum. The latter method is but a makeshift, however.

Never tack linoleum down with ordinary carpet tacks. Laid in this way, no linoleum can be made watertight. Moisture will get underneath it, the wood will rot, the linoleum will break and there is a splendid opportunity for insects to harbor beneath. Truly this type of a linoleum covered floor is insanitary. On the contrary have the linoleum cut so as to allow for the stretching. Remember it has been rolled up for weeks or months, and it is bound to continue to "grow" for some little time after is has been laid flat and walked upon. Allow it to lie loose on the floor for at least two weeks. If this is done it will never bother you by the buckling that causes it to crack.

After it is stretched as much as it will, it must be cut to fit closely all around the room. Apply a waterproof cement, which is a sort of glue made especially for laying linoleum. The ideal way is to coat the entire back of the linoleum with it, but if you do not want to assume this work, at least cement the edges and seams with particular attention to the joinings at sink, washtub legs, all edges, and other places where water may be apt to gather. Use a small paint brush and be sure to have available, heavy objects to weight down the linoleum while the cement is drying. The professional workman uses sand bags made of duck 14 inches square, weighing about 25 lbs. each, but any kind of an object that is heavy enough will serve the purpose. Do not remove them for at least 24 hours after the linoleuum is laid.

In applying the cement the best way is to coat both the floor and the back of the linoleum and be sure if any cement get on the linoleuum surface to remove it at once with alcohol. A gallon of cement will ordinarily be sufficient for 10 square yards of linoleum if the whole back is coated, while the same quantity will be enough for approximately 25 square yards if only seams and edges are coated.

The next step is fully as important. First, scrub it with any of the scouring powders or washing soda and a scrub brush. Scrub a small area, dhy it, and apply paste wax, allowing it to absorb as much as it will, continue until the entire surface has been filled with as much paste as it will absorb. Linoleum is extremely porous and unless you first fill these pores, with wax they will become filled with dirt and that will be extremely difficult to remove. After waxing, however, soil becomes merely a surface affiair. Wash and scrub the linoleum as much as you please, always being careful, however, to replace the wax with a little liquid wax applied with a mop. With this treatment it will never become necessary to scour the linoleum after the first time.

CHILLED MOCHA

2 cupfuls of milk
2 cupfuls of boiling water
2 cupfuls of strong black coffee
1 cupful of grated chocolate or cocoa
4 tablespoonfuls of sugar
½ teaspoonful of vanilla

Scald the milk and add the boiling water. Mix the sugar and chocolate and gradually rub to a smooth paste with some of the hot milk and water, then cook with it for about five minutes. Add coffee, vanilla and a few grains of salt, and remove from the fire. Set aside to cool and serve chilled with a spoonful of whipped cream on top.

COFFEE EGGNOG FOR FOUR

2 eggs
3 cupfuls of milk
½ cupful of strong black coffee
2½ tablespoonfuls of sugar
Dash of salt

Whip the eggs light with an egg beater and gradually add other ingredients, which should all be as cold as possible. Strain into glasses and serve cold.

BEAN ANTHRACNOSE

(Continued from page 577)

from soil-carried organisms may be expected.

Loss Caused by the Disease

A conservative estimate of the decreased value of the Canadian bean crop, caused by this one disease, is probably over 10 per cent. In some localities and during some seasons it is undoubtedly much more; many fields have been examined where the crop was reduced by from 50 to 75 per cent. The total annual loss on the dried bean crop alone amounts to over 300,000 bushels, and to this must be added the loss caused to string beans which are grown in every garden. This loss is manifest in several ways. The first and most important is decreased yield, which loss may vary from little or nothing to almost a complete failure. Beans from badly and even moderately infected fields are not suitable for seed purposes unless very thoroughly hand-picked, and even then diseased beans are sure to escape. Probably the growers of string beans, where the green pods are used for table or canning purposes, suffer the greatest proportional loss as infected pods are unmarketable.

Spread and Development of the Disease

The disease, as previously stated, is propagated from year to year chiefly by planting diseased seed and to a lesser extent by using infected bean refuse as fertilizer, or failure on the part of the grower to practice a reasonable crop rotation. The spread and development of the disease in the field is influenced to a large extent by the prevailing climatic and soil conditions. During a bright, dry season little damage is caused, but during wet, cloudy weather it spreads and develops rapidly. This is because of three conditions: (1) The spores have a mucilaginous envelope which holds them together when dry and retards their being carried from the diseased lesion to healthy plants by the wind. (2) The spores are produced most abundantly during wet weather. (3) They can germinate and gain entrance to healthy tissue only when moisture is present.

Beans grown on low, wet, or poorly drained soil are usually more severely injured than those grown on high, dry soil. This is probably due to a greater amount of moisture in the atmosphere surrounding the plants and to the fact that an abundance of soil moisture encourages an early rapid growth of the fungus contained in or on the infected seed during germination. The same condition is brought about even on high soil if the seed is planted too early and during wet weather.

Healthy leaves become infected by brushing against moist, spore-bearing lesions. Spores are carried from one plant to another by cultivating machinery and on the hands of the picker. It is therefore advisable to avoid working among beans when the foliage is wet.

Control Measures

Numerous suggestions for the control of anthracnose have been made from time to time, but these have failed, partly because of their inefficiency but largely due to the fact that the growers have failed to put them into practice carefully and continuously. The chief point to keep in mind is that diseased seed produces diseased plants and these serve as a source of infection to healthy plants. It would seem that a combination of control measures might give the best result. The various steps are here described separately but should be practised collectively.

Pod selection: Disease-free seed can be most easily obtained by gathering sound pods from a field as nearly disease-free as is available. In selecting these pods care should be taken to select from plants which appear resistant to the disease high yielders and true to the desired type.

As an additional precaution, the pods should be immersed in one of the following solutions for two or three minutes:

(a) Copper sulphate, 1 lb. in 80 gallons of water.

(b) Formalin, 1 pint in 30 gallons of water.

(c) Corrosive sublimate, 1 oz. in 8 gallons of water.

The pods are then thoroughly dried, threshed and the seed stored in a clean sack; care should be taken to avoid reinfection of the seed. If it is impracticable to select enough pods to supply seed for planting the whole of the next year's crop, sufficient should be selected for a seed plot.

Seed plot: A seed plot is nothing more nor less than a plot on which is propagated desirable seed, of pure variety, true to type, high yielding and free from diseases, in sufficient quantity to supply seed for planting the main crop the following year. The very best seed obtainable should be secured for planting the seed plot. This practice has given excellent results with other crops and might profitably be practised by seed growers.

Seed Selection: Where pod selection has not been practised, and even if it has, the beans should be carefully hand-picked, removing all discoloured, spotted, shrunken, or inferior seed before planting. This will not remove all the infected seed, but will materially reduce the amount. Several preliminary experiments in careful hand-selection gave very promising results, not only as a control for anthracnose but as a means of eliminating inferior seed and disease in general.

Seed treatment: Treament of seed beans has not given wholly reliable results, probably due to the fact that the organism causing the disease penetrates deeply into the tissue, and cannot be easily destroyed without injuring the germinating quality of the seed. Nevertheless, after the seed has been carefully hand-selected, treatment will help by destroying slight surface infections. Preliminary experiments with various seed treatments indicate that soaking the seed for three minutes in any of the solutions given above reduces the amount of disease and increases the yield.

Copper sulphate and corrosive sublimate are poisons and beans treated with them should not be used for table purposes or fed to animals.

Spraying: Spraying beans for the control of anthracnose has not proved entirely successful or economical; the disease can be checked to some extent but not controlled. When great importance is attached to freedom from disease such as on a seed plot or where beans are being grown for seed purposes, they should be sprayed with a 2:2:40 or 4:4:40 Bordeaux mixture, the first application being made when the plants are quite small, and succeeding applications at intervals of one week or 10 days.

In addition to the above practices the grower should observe the following precautions:—

1. Select a marketable variety known to show resistance to the disease in his neighbourhood.
2. Plant on dry, well-drained soil.
3. Avoid the use of bean refuse as fertilizer on the bean field.
4. Plant beans in the same field not oftener than once in three years.
5. Avoid cultivating, picking, or doing any other work among the beans during wet weather.

QUACK, COUCH OR QUICK GRASS

(Experimental Farms Note.)

This weed is perennial, propagated by seeds and creeping root-stalks, persistent in all deep ploughed lands and in all crops, having great power in spreading and choking out other plants.

The permanent means of bringing this weed under control is to adopt for the area infested a sort of rotation of crops or cropping plan which includes a hoed crop, once in three or four years. A short rotation of three years duration is preferable since there is a hoed crop and only one crop of hay in a three year period. conditions which tend to give the pest the east chance of flourishing. Another suitable rotation is one of four years duration of one year each in hoed, grain, clover and timothy hay crop. For tomothy hay or pasture areas the procedure is as follows:

Allow the plant to exhaust its substance in the production of a hay crop, which should be cut and removed as soon as the head is formed and before it is in bloom. Plough shallow, roll, disc once or twice to break up the sod and then cultivate with a stiff-tooth cutivator until the root-stalks have been pulled to the surface of the soil. When accumulation of roots is so great as to interfere with the efficient working of the cultivator remove or burn them and continue cultivating in order to complete the work. In the autumn, ridge or deep plough the field. Ridging exposes a greater surface of soil and couch roots to the action of frost than ordinary ploughing. Frost is an agent in the control of quack grass that should be made use of on every possibe occasion.

Grain areas that contain quack are not in fit condition to be seeded down to grasses and clovers nor are they in shape for the growing of profitable crops in the future until after control measures have been introduced. Immediately after harvest stubble land should be shallow ploughed, disced once or twice to break down and consolidate the furrow slices after which the stiff-tooth cultivator can be em-

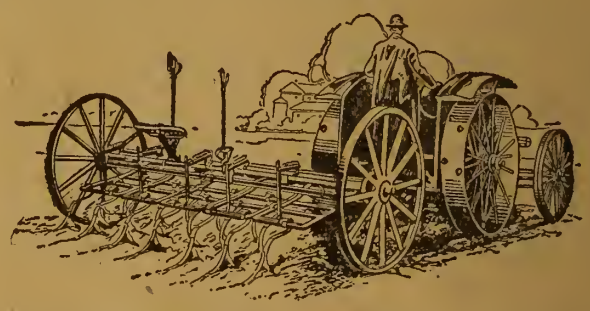
Massey-Harris



Implements for Power Farming

Now that the Tractor has proven its worth, and farming with power has become a realization, the need for strong and big implements, suitable for use with the Tractor is felt. Massey-Harris Implements are peculiarly fitted for Tractor use, being strongly built of the best quality of materials, and finest workmanship. They are fitted with Hitch suitable for use with Tractor.

Grain Binders, Corn Harvesters, Mowers, Hay Loaders, Cultivators, Drills, Disc Harrows, Single and Tandem, Drag Harrows, Manure Spreaders, Plows Packers and Land Rollers, Wagons, etc. Also a complete line of Belt-driven Machines for use on the farm, as, Grinders, Feed Cutters, Ensilage Cutters, Saw Outfits, etc., etc.

Get your Tractor and Implements from the Company which makes both and accepts responsibility for the whole Outfit.

Agencies Everywhere

ployed to advantage to obtain the necessary depth to facilitate the drawing of the root stalks or underground stems of quacn to the surface. Cultivation should be thorough and the fall treatment as outlined for meadow or pasture land will apply on stubble.

The stiff tooth cultivator is an essential implement in any cultural plan for the control of quack grass. The disc harrow used as the combatant implement acts as a force against the success of otherwise thorough treatment. The use of the disc harrow in this connection should be limited to work of disintegrating and pulverizing sod and surface soil. .The object is to draw the entire rootstalk to the surface rather than break each root into several parts. Each small piece, like the potato set, is capable of establishing a new plant.

The following spring the area treated as described, should be planted to hoed crop for which manure may be applied, before the last ploughing or ridging in the fall or during the winter or spring. This brings us to the first year of the rotation from which period the procedure in cropping would be as outlined in the rotations recommended.

Where no reguar hoed crop is grown, which is poor farm practice, rape or buckwheat sown on an infected area after it has been thoroughly cultivated and the rootstalks removed, prove excellent smothering crops. For late sowing and as "first aid" in the control of the weed on an exceptionally dirty field where other crops would be choked out and before attempting a hoed crop the two mentioned crops are very useful. Smothering crops, however, are recommended only as a temporary means of control. It is only by thorough persistent cultural methods and the proper utilization of crops that any satisfactory degree of success will be attained.—W. L. Graham, Asst. Dominion Field Husbandman.

CARE OF SMALL PLOTS OF CEREALS

(Experimental Farms Note.)

A great deal has been said about the purity of seed and the use of good seed. How may this be procured and kept pure? The Experimental Farms distribute small samples of good seed, but the grain grower is the man who must maintain its spurity. The samples that the Experimental Farms distribute are sufficient to seed 1/20 of an acre. It is the care of this plot and the subsequent plots that I wish to emphasize.

The seed should be sown in a plot about 33'x66' in dimension, on the most productive piece of land (suitable for grain, on othe farm. The seed bed should be as nearly as perfect as the most approved methods of cultivation in the district will permitfl Seeding of this plot should be done as eary in the spring as is possible within reason. The seed drill must be thoroughly clean and free from grains of other varieties. In seeding it is as well to leave a small path about 12" to 14" between each strip of the drill. This may be done by allowing the wheel of the seeder to return in the track made by the wheel on the land already seeded.

During the growing period all noxious weeds and large weeds that will be detrimental to the crop should be removed. The path referred to above is useful in that it allows ready access to the plot with a minimum amount of damage. Weeding should be done from time to time all through the season. When the plot heads out "rogueing" should start. Rogueing is the process of eradicating the grain plants that are off type or those of other varieties; anything, in fact, that is foreign to the plot should be removed. The more carefully that this is done, the purer will be the resulting seed. The plot should be carefully rogued three or four times before harvest, and more especially should the plot be carefully rogued the day that it is cut, as at this time differences that have not shown before may be more readily noticed.

Further operations should all be done by hand, where possible, unless great care is taken to see that all machinery is faultlessly clean. The binder may be used for cutting if all adhering straw and heads have been removed, but preferably cut by hand. The stocks should be covered to prevent the ravages of birds and also to keep the grain from getting weathered. It is absolutely essential that threshing be done by hand. The easiest method is to use a flail; be sure that your barn floor is perfectly clean. If the stooks are carried to the barn in large sheets or tarpaulins purity can be more readily maintained and the threshing made more easy. When dealing with large plots, or in exceptional cases, the threshing machine may be used, but only when one is perfectly certain that stray grains have been removed, and then it is advisable to thresh only when the grain from the plot is of a different class of grain from that which has been threshed in the mill previously; follow wheat by oats or barley, oats by wheat or barley; never thresh wheat after wheat, or oats after oats.

When cleaning the seed be absolutely sure that all foreign grains are removed from the fanning mill. Take out all the sieves and clean out thoroughly all the cracks and crevices that are likely to retain grain of other samples. Be certain the machinery and grain containers are perfectly clean bags in a place free from the clean bags in a place fre from the ravages of mice, etc.

All grain growers are advised to maintain a seed plot. The method outlined above may be used on a larger scale for a regular seed plot. This plot should be large enough so that a considerable quantity of grain, of known purity, nay be produced for subsequent crops. The secrets of success in the care of the plot are thoroughness and care. Good pure seed is essesntial to good farming.—P. Russel Cowan, Cereaist.

WEIGHT OF SETTLED SILAGE

The average weight per cubic foot of settled silage to the various depths in a silo have been figured out by the Iowa experiment station, as follows:

10 ft., 35 lbs.; 11 ft., 35.3 lbs.; 12 ft., 35.6 lbs.; 13 ft., 35.9 lbs.; 14 ft., 36.2 lbs.; 15 ft., 36.4 lbs.; 16 ft., 36.7 lbs.; 17 ft., 36.9 lbs.; 18 ft., 37.1 lbs.; 19 ft., 37.3 lbs.; 20 ft., 37.5 lbs.; 21 ft., 37.6 lbs.; 22 ft., 37.8 lbs.; 23 ft., 380 lbs.; 24 ft., 38.1 lbs.; 25 ft., 38.3 lbs.; 26 ft., 38.4 lbs.; 27 ft., 38.6 lbs.; 28 ft., 38.7 lbs.; 29 ft., 38.9 lbs.; 30 ft., 39.0 lbs.

To find the number of cubic feet of silage in a silo, find the radius, or one-half the diameter of the silo (inside) in feet; multiply that number by itself and then by 3.1416 and you have the cubic feet for one foot of depth. Multiply that by the depth of the silage in feet and you have the total cubic feet.

HORSES IN DEMAND

Men experienced in market conditions state that there never before has been so strong a demand for good draft horses, nor such high prices paid, in the history of the Chicago horse market.

The demand is strong for all kinds, but the preference is much in favor of drafters standing sixteen hands and over, weighing 1,700 pounds or more. Prices range from $275 to $450, depending on the merits of the animal. This condition has prevailed steadily for the past four weeks.

Thin One: "Why is it fat people are always good-natured?"

Fat One: "It pays us. You see we can neither fight nor run."

QUICK ACCELERATION

THE New McLaughlin Light Six is alert to every whim of the driver. It responds instantaneously. For speed, power on hills, quick acceleration and ease of control, the New Light Six is unrivalled.

The New McLaughlin Light Six is powered with the famous 44-horse power McLaughlin Light Six overhead valve motor. Owners report from 20 to 30 miles per gallon and from 8 to 12 thousand miles on tires.

CUTTING SEED POTATOES

(Continued from page 579)

of Ohio has shown by a comparison of the varieties Bovel and Carman No. 3, a many eyed and a few eyed variety respectively, that with a given size of seed piece, the more eyes present, the more stalks that will develop through the ratio of eye to stalk increase is not proportional.

At the time of making a potato crop survey of production in Steuben County and on Long Island, New York, the questioner occasionally asked why the Rural type is preferred in Steuben County and why the Green Mountain type on Long Island. Curiously enough the Rural was preferred in Steuben County because too many eyes are present on the Green Mountain seed piece, while on Long Island one reason for preference to the Green Mountain was due to the paucity of eyes on the size of piece generally cut in this region.

A few growers even now practice clipping off and discarding seed or apicol end of tubers because of the idea that two many stems will form, causing the development of small unmarketable tubers. Other growers discard the stem end because of shallower and often less vigorous eyes on this portion. There are three potent reasons why these practices are both wasteful and unwarranted:

(1) Appleman of Maryland has shown that lateral and basal eyes, which tend to remain partially or wholly dormant on seed planted whole may be made of approximately equal viability and value by cutting the tuber;

(2) Equality in basal and apicol seed pieces is possible, and the likelihood of too many stems from the seed end avoided by cutting most seed tubers longitudinally, thus dividing the "Bud cluster" and leaving eyes of equal value on all pieces;

(3) In general all experiments have shown that yield is directly proportional to size of seed piece; therefore there is no just cause to discard any portion of the seed tuber.

Whipple, of Montana, thinned stands of potatoes planted to two ounce pieces to one stalk per hill in order to test whether the marketable yield might be increased thereby. Such thinning improved the market shape and uniformity, but the results do not justify any conclusion that either total or marketable yield was increased.

Most experiments testing the influence of number of eyes on yield have, in reality, also been tests of the influence of size of seed piece, because size of piece increased with the increase in number of eyes. Zavitz of Ontario should be again credited with a valid answer to this question, since in his five year test of the influence of number of eyes, he kept size of seed piece constant by using one ounce pieces in all plots. Comparing plots planted to such pieces containing one, two, three, four and five eyes, respectively, he found that as the number of eyes increased the total yield increased while the per cent of marketable yield decreased. The difference in marketable yield was, however, not more than five per cent in any case. These tests show that yield is proportional to number of stalks per hill. Since other tests indicate conclusively that yield is also proportional to size of seed piece, nothing is to be gained by cutting to a certain minimum number of eyes.

Interval Between Cutting and Planting

In general, seed potatoes are cut only a day or two before planting. This is by all means to be advised. On the contrary there are occasional regions and occasional growers who practice cutting several days, perhaps a week or more, before time to plant. An example of this may be found in Suffolk and Nassau Counties, Long Island, where apparently the practice is justified. Here, earliness of planting is important and bears directly on the marketing of the resulting crop at a date sufficiently early to profit by early market prices. These growers cut seed an average of six days before planting. The large quantity to be cut for the large average acreage planted makes it policy to cut in advance in order that the crop be **planted just as** soon as weather and soil conditions are favorable. A study of the practice by 272 growers on the Island in 1913 shows that as the interval between cutting and planting increased, the per cent of growers dusting seed increased. This being true no detrimental influence on yield on account of the interval was noted. In other sections of New York, the average interval is about two days, the increase in interval being accompanied by an increase in the dusting practice. Without dusting it is safe to say that the sooner seed is planted after cutting, the better for the seed and the yield. A few growers have been observed to purposely cut and store seed for drying some time prior to planting with the idea that such seed is thereby improved. Cut seed will as quickly callous and the vitality will be better conserved by planting at once.

Dust Material

There is little to choose between the several materials used for dusting. Among 1,390 growers visited in 1913 and 1914 in New York, land plaster or gypsum, sulphur, hydrated lime, air slaked lime, road dust and ashes were used. By far the greater proportion of these growers used land plaster or sulphur with preference for the former. Sherbakoff at Cornell several years ago showed that there is little benefit in the use of sulphur for scab prevention. Land plaster, because of its adhesive qualities and cheapness, has been and doubtless will continue to be most used.

"The Tobacco with a heart"

NOTES FROM THE N. S. AGRICULTURAL COLLEGE

(Continued from page 578)

every reason to believe that those who market their clip through the Canadian Co-operative will realize an equal gain this year.

The Provincial Department of Agriculture hs appointed Mr. L. A. Black, a student of the Agricultural College, to assist farmers in taking advantage of the machinery provided by the Wool Growers Ltd. There is still some uncertainty as to what the prevailing prices will be this season. The outlook is for continued high figures for medium and fine wools, which constitute by far the major portion of the Nova Scotia clip. For the coarser classes of wool, however, prices are more uncertain.

Sheep farmers all have a vital interest in this matter, but many may not be aware of the steps to be taken in order to get in touch with the Canadian Co-operative Wool Growers, Ltd. These should communicate at once with the Department of Agriculture, Truro.

CAPTAIN GOODE RESIGNS

Captain C. A. Goode, Assistant Provincial Entomologist and lecturer in Entomology at the Agricultural College, has resigned to accept a position with the Soldiers' Settlement Board. Capt. Goode has been on the College Staff for some five years, but during half that time has been overseas on military service. Since his return last fall he has taken full charge of the instruction work of his Department, in the absence of Professor Brittain. Capt. Goode is one of the most popular and efficient members of the College staff, and although he has resigned, it is hoped that his services can be retained as part time lecturer at the College.

THE CULTIVATION OF MUSTARD

(Experimental Farms Note.)

The seeds of two species of Mustard are used commercially, namely White Mustard (Brassica alba) and Black Mustard (Brassica nigra). The common names of both species are somewhat misleading as in both the flowers are yellow, while the seeds are yellow in White Mustard and brown dark purple in Black Mustard.

Both species sgrow rapidly, and the seeds scan be sown from the beginning of May to the end of the first week in June. The crop will, as a rule, be ready for cutting in August.

Experiments with both species were carried out at the Central Experimental Farm during 1916, and also to some extent during 1917 and 1918. The seeds were obtained from the United States, France, Holland, Sweden and Russia.

The plots swere of various sizes and the rates of sowing per acre also varied considerably. The yield of seeds varied and was influenced largely by the dryness or otherwise of the season at the time of flowering. The seed-pods of White Mustard usually remain closed when ripe, but in Black Mustard the pods open as they ripen and allow the seeds to escape, consequently the latter crop has to be cut as soon as the first pods sare ripe.

The particulars of yield per acre for White Mustard are as follows:

Sown at the rate of 7 lbs. per acre, yield of seed at the rate of 326¼ lbs. per acre.

Sown at 11¼ bs. per acre, yield of seed 198¾ lbs. per acre.

Sown at the rate of 14½ lbs. per acre, yield of seed 346½ lbs. per acre.

Sown at the rate of 14 lbs. per acre, yield of seed at the rate of 891 lbs. per acre.

For Black Mustard the yields were as follows:

Sown at the rate of 7 lbs. per acre, yield of seed at the rate of 439¾ lbs. per acre.

Sown at the rate of 11¼ bs. per acre, yield of seed at the rate of 22½ lbss. per acre.

Sown at the rate of 13¾ lbs. per acre, yield of seed at the rate of 30 lbs. per acre.

Samples of both species were sent to one of tre leading firms of Mustard Manufacturers in Canada, which reported as follows:

"The Yellow Mustard seed has a fairly good flavor but not as good as the standard English which we consider the best. The Black Mustard shows good volatie strength and good flavor and to our minds equals the best that is grown."—J. Adams, Assistant Dominion Botanist.

GETTING RID OF TWO BAD WEEDS

That twitch grass can be eliminated by the use of rape is the firm belief of Prof. J. E. Howitt of the O.A.C. Guelph, as a result of a series of experiments extending over a period of some eight years. He reports a series of fourteen trials of which he had eleven complete successes and no failures. His method follows— cultivate the field until about the middle of June, running over it frequently with the cultivator so as to keep the tops down, and thus weaken the roots. Then apply manure at the rate of 20 tons per acre, 12 good loads. Cultivate the manure in thoroughly, and after ridging between the ridges plant rape in rows at the rate of 1½ lbs. per acre. Cultivate the field every week or ten days until the rape covers the ground. If the twitch grass is not all destroyed that fall ridge up the field late in the fall and put in a hoed crop next year.

Prof. Howitt has also obtained excellent results in the destruction of wild mustard by spraying with iron sulphate. His recommendations are to dissovle 80 pounds of iron sulphate in 40 gallon of water and strain the solution through a cheese cloth to remove dirt and small particles that might clog the spray pump. Apply on a clear, calm day just as the first plants in the field begin to flower. If the work is delayed it becomes more difficult, and if a heavy rain comes within 24 hours after the soution is applied, it will be necessary to spray again. An ordinary handpump barrel sprayer may be used or a potato sprayer may be rigged up to do the work. The main point is to make sure that every plant is covered with the solution and at the proper time. Iron sulphate or copperas solutions do not destroy the standing grain.

TREATING SEED OATS TO PREVENT SMUT

As a result of several years' experimental work in treating oats for smut the Illinois Experiment Station recommends the following treatment:—

Mix one pint of formalin (40 per cent. formaldehyde) with 10 gallons of water. Use one pint of this solution per bushel of oats treated. Sprinkle this evenly over the oats and thoroughly but quickly mix until every grain is slightly moistened. Cover at once with a blanket, canvas, or sacks. Allow the oats to remain covered for two hours, after which time uncover. If the oats are not sown at once, thoroughly air to allow the formaldehyde gas to escape.

FARM WEEDS ARE SAVAGE FIGHTERS

A weed is a wild plant and trained to struggle and fight for its existence. A cultivated plant has had much of the fight taken out of it through long years of selecting and training it for useful ends. Nothing can remain a wild fighter and at the same time excel in useful qualities. One quality must give way as the other advances. The original dog and wolf are probably much alike in character. The modern house-dog, dwarfed in size and trained in gentle habits, must be protected from the wolf, or the latter would eat him up. In like manner, corn or wheat or potatoes or root crops can never hold their own against quack grass, ragweed, or redroot. Left to themselves in such a struggle, the useful or "cultivated" plants are always swamped. The cultivated grasses, in a sour, neglected lawn or pasture give way to the weeds and poor grass, but put on lime and nitrogen and phosphorus, and the better grasses come back and occupy the land. This same thing runs all through life, for as plants or animals are improved and made more useful through selection and care, they must have higher culture, better feeding, and more careful protection. They are no longer fighters, but things to be defended and fought for as the price of their improvement.

The high price as well as scarity of clover seed this year makes it necessary to prepare the soil properly and plant the seed in such manner that every good seed will do its full allotted duty in producing a healthy plant. During the last few years hundreds of bushels of clover seed have been planted with no appreciable success in securing a good stand or crop of clover. The clover plant is very sensitive to certain soil conditions. It is more sensitive than any other crop, a fact which a large number of farmers cannot understand. On soils where clover is grown with difficulty it is necessary to give the ground special preparation and treatment.

Mr. Geo. Robertson Poultry Department, Experimental Farm, Ottawa, claims that the greatest value of egg laying contests lies in the fact that they attract public interest to the producing end of the business rather than to form and and feathers as has been customary in the past.. They also create greater confidence in records and should go a long way towards increasing egg production and comemrcial poultry keeping.

Protection

WHETHER you build a Factory, Warehouse, Barn or a Shed, assure yourself of a serviceable roof—one that will give continuous hard wear under varying weather conditions.

NEPONSET PAROID

solves your roofing problems. It enables you to lay a roof that will remain a good roof under all conditions, in all weather, cold, heat or rain.

The base of Neponset Paroid is a high-grade rag felt thoroughly impregnated with asphalt, making it positively waterproof and fire-resisting.

It is further reinforced with a talc surface, grey in color; or with a permanent slate surface, red or green in color.

Neponset Paroid is not only impervious to the driving storms, but protects you against fire through falling embers.

EASY TO LAY—With every roll of Neponset Paroid is supplied sufficient nails and cement with full directions.

There is a Neponset dealer in your district. Write us for his name and a copy of our illustrated booklet "Roofing Canada."

SPRING CARE OF THE FLOCK

With mutton and wool at present prices there is every incentive to prevent sickness and trouble in the flock and to raise every lamb that is born. Presuming that the ewes had proper fall and winter treatment, in other words, that they were dipped, flushed, had the services of a good purebred ram, had adequate hay, roots and a little grain with salt and water through the winter months, there should be a good crop of lambs in prospect, with the ewes in condition to undergo the ordeal of lambing successfully and raise a goodly lot of twins.

As the ewes approach lambing, they should have an increase of wheat bran with some oil cake in their ration and a decided lessening of roots, free access to salt, and water fresh daily.

Pens four feet by six should be provided by having suitable hurdles on hand to put up as they are wanted. When a ewe shows signs of parturition she should be put in a pen and fed rather sparingly. If the loose tags of wool about the udder have not already been clipped, see to their removal and thus avoid wool balls in the lambs' stomachs. When lambing begins, put on a night watch for not a single lamb should be allowed to perish from neglect. If the weather is cold, the lamb may need to be kept warm until it dries aff and gets a good feed of milk. It should get milk as soon after birth as possible. Keep the ewe in the small pen until the lambs are strong enough to follow their dam with out undue effort.

A warm drink as soon as the ewe will take it after lambing is beneficial and as she regains normal condition she should have, according to her capacity, from one to three pounds of grain daily. A good mixture is oats five parts, wheat bran one part and ground oil cake one part. Some good shepherds vary this ration by boiing peas and mixing the hot, soft boiled peas with wheat bran in equal parts by bulk.

Ground peas may also replace part of the oats in the dry grain ration. See that the grain ration is all cleaned up; if any is left remove it and feed more sparingly next time.

As the lambs grow, give them an enclosure where the ewes cannot enter and give them there a mixtuhe of crushed oats and wheat bran with a little oil cake added.

Until pasture is available, green feed in the form of roots or ensilage is desirable for both ewes and lambs. Salt should be accessible at all times and an abundance of water. Sheep will consume snow and seem to do fairly well, but it is not considered the best way of supplying water.

Shoud any ticks be found on the ewes before or after lambing, before shearing time, they can be destroyed fairly effectively by putting a pinch of Scotch snuff in close to the skin on four places along side each of the sheep and repeat in a week.—W. W. Hubbard, Supt. Experimental Station, Fredericton, N. B.

REAL VALUE OF BARNYARD MANURE

It is common to calculate the worth of manure in terms of the three chief fertility elements which it carries, namely, nitrogen, potassium and phosphorus. These are the plant food elements in soil which "wear out," so to speak, with greatest rapidity, and which need constant replacement if satisfactory cropping is to continue. Consequently, a ton of manure is said to be worth three, four, five or more dollars depending upon the current price of similar amounts of plant food purchased in the form of commercial fertilizers.

All of this is a true enough means of measurement, but it is none the less somewhat misleading. Five dollars worth of commercial fertilizer will by no means give the same results in soil enrichment as five dollars worth of barnyard manure, the value of which is calculated as indicated. In the first place manure carries organic matter. This produces a mellowness in the soil which is wonderfully effective in cropping. By this mellowing process a physical condition of the soil is reached whicr permits a better circulation of air and enables the soil bacteria to carry on their work with greater activity. It should not be forgotten that manure carries countless billions of bacteria through whose assistance fertility clements are wrought into forms in which plants can feed upon them.

The organic matter which manure carries makes possible also a gradual increase in the humus content of soil. The presence of humus not only renders a soil more retentive of heat, but it increases the power of soil to retain moisture—not excess moisture or drainage water, but the film water by which each soil particle normally is surrounded. All things considered it is quite possible to state the worth of manure somewhat as follows: Five dollars worth of barnyard manure, valued in terms of commercial nitrogen, potassium and phosphorus, is worth five dollars worth of commercial fertilizer plus a beneficial mellowing effect upon the soil, plus a better circulation of air, plus a warmer seedbed in spring and more soil moisture in times of drought, plus the inoculating effect of countless billions of soil bacteria. There may be other advantages which have not been enumerated but these are enough to prove our point. Fertilizers of the commercial type have their place, their use and their value, but manure has a great deal that these can never have. Conservation of stable wastes is therefore a matter of prime importance, for it is never possible to purchase by the bag the real soil enrichment which is possessed by manure.

SALT IN LIVE STOCK RATIONS

Common salt (sodium chloride) play an important part in the diet of most classes of farm animals. This will be better appreciated if we stop to consider that, of the minerals in the fluids of the body, salt is present in the largest amount. Salt does not contribute directly to the energy of the body as does the food consumed, but nevertheless it is necessary in the proper nutrition of the body. Besides its physiological action salt serves as an appetizer and increases the palatability of many foods. It also stimulates the secretion of digestive juices, promotes god circulation of the fluids of the body and prevents digestive disturbances.

Of the common classes of farm animals, namely horses, cattle, sheep and swine, the later have the least need of salt. This is in all probability due to the difference in diet, that of swine usually consisting largely of grain whereas other classes consume large quantities of roughage in which less salt is found. Too large quantities of salt derange the stomach and bowels of swine causing gases, diarrhoea, convulsions and paralysis, often resulting in death. Nevertheless pigs should have access to salt, the best means of priviling it being to keep before them at all times, in a covered receptacle if outdoors, a mixture of salt, charcoal, airslaked lime, bone-meal and wood ashes or soft coal cinders.

For sheep salt is very necessary. Keeping it before them at all times is here again the most advisable course for an irregular supply induces scouring. The salte tends to keep the sheep in a good state of health and they are better able to ward off attacks of disease or internal parasites. Furthermore sheep fed plenty of salt shear a better quality and heavier fleece than do those receiving no salt.

In the case of cows owing to their much larger size and the fact that they are giving daily large amounts of milk which contains considerable salt, a heavier ration of salt is needed. For cows being fed in the stable up to 2.5 ounces per day is recommended. While cows giving a heavy flow of milk require an abundance of salt, at the same time the dry, pregnant cows should not be overlooked as their requirements are even greater. Cattle on pasture usualy require less salt than those indoors and the amount necessary varies with the nature of the soil and vegetation. On this account it is advisable to have a supply before them at all times. Either rock salt or ground salt may be used but in either case it should be placed in a receptacle in which it will be sheltered from the rain or much of it will be lost. Young growing animals usually require a larger percentage of salt than do mature animals.

Horses are no exception in the matter of salt requirement. Here again it should be regularly supplied. A cake of rock salt in the corner of the manger where the horse can get it at will is the best means of provision. Horses at heavy work require more than those that are idle or at light work. An allowance of 2 ounces per day is generally recommended.—Geo. W. Muir, Asst. Dominion Animal Husbandman.

WHITE SCOURS IN YOUNG CALVES

Contagious scours with new-born calves is one of the most difficult contagions to handle on the dairy farm. If not given immediate attention upon its appearance, the disease is very certain to result in the death of the calves it attacks and also is very apt to appear in all the calves born in the stable.

So thoroughly does the organism seem to spread that ordinarily it is almost impossible to save calves which are dropped in a barn where the disease is prevalent. Very often the removal of a cow to a special building which has been unused and therefore is not infected, just previous to her freshening, will permit the survival of her calf.

On most dairy farms it is not practical to take freshening cows into quarters where cattle have not been maintained. It is possible, however, to thoroughly disinfect the whole stable and to repeat the disinfection enough times to be certain the stable has been freed of the organisms causing contagious scours. Even in stables which are apparently clean, the malady may persist, but this is unusual.

A very important measure is the immediate disinfection of the calf's navel as soon as it is dropped. It is wise to give the calving stall a thorough cleaning previous to the birth of a calf. In the stall should be an abundance of dry, clean bedding, which should be sprinkled with a carbolic acid solution. In disinfecting the navel, the cord should be tied with a string which has been taken from a strong solution of carbolic acid. The stump of the cord and the adjacent skin should be washed with a solution

of: Iodine, one-half gram; iodine of potassium, one-half gram; and water, one quart. As soon as the cord is dry it should be covered with collodion or tar containing one per cent. of iodine.

As quickly as a calf shows signs of this disease, it should be immediately taken to another building and the stall in which it has been kept should be thoroughly cleaned and disinfected.

In most cases, this system of treatment will give results if it is followed faithfully. The safest and surest practice is to accompany this with the hypodermic administration of polyvalent calf dysenteric serum or white scours bacterin immediately following the calf's birth. If the injection is not available when a calf is dropped and cannot be had until the first symptoms of the disease appear, a double dosage will sometimes have a curative effect.

PRUNING OLD APPLE TREES

Many people, especially beginners, when about to prune a tree, experience considerable difficulty in deciding where to begin and just what to do. This might be overcome to a great extent if one understands the real object of pruning, the main principle and the good and bad results of diffrent methods. Primarily we prune to get rid of excess wood; that is, wood which would never bear fruit, and which would prevent fruit-bearing branches from reciving their proper amount of sunlight. The first thing to do is to remove lower branches, heading only high enough to work under comfortably with a team or tractor in the early part of the summer. About the time fruit develops enough to weight down the branches work will have been discontinued in most orchards. The ease and cheapness of picking fruit from such branches makes them too desirable to be dispensed wth.

Next, cut out suckers or water sprouts and all dead wood, and then one is ready to begin the actual shaping of the tree. Remove enough branches from the centre to allow the sunlight to reach all parts. A few minutes careful survey of each tree before further pruning will determine the main structural limbs of each tree. With these main structural limbs always in mind we now cut out everything that interferes with their proper development. A successful pruner never hesitates to take out good, healthy, fruit-bearing branches when they seriously interfere with these limbs. Many make the great mistake of postponing their removal a year, and others make the still greater mistake of never removing them, knowing it means the temporary reduction of fruit. Among the first of these to remove are the limbs that grow backward in to the tree, as these are soon overshadowed by the main limbs, which stop their growth and make them unproductive. Besides they are likely to cross and rub other limbs.

When limbs and branches cross and rub, one of these should always be removed, unless they cross so near their bases that there is no friction. I consider this important, as branches soon become so scarred from the rubbing that not enough nourishment reaches the fruit to propery develop it. After these essential operations have been attended to one should devote some time to the less important but necessasry work that finishes the pruning of a tree. Limbs that are too long are liable to break with a load of fruit and should be shortened. This also helps make the tree symetrical. Most trees, unless properly pruned every year, develop too many branches along their main limbs. These should be trimmed enough so that the remaining ones have ample room for future development. Do not make the mistake, however, of stripping these main limbs of all the little fruit spurs just to make the tree look neater.

If there is a wide gap left by a broken limb, numerous suckers almost always shoot out in an endeavor to replace the missing wood. Rather than remove all of these, two or three of the sturdiest should be left. It is important to shorten these if they lengthen out too much, in order to strengthen the limb and encourage fruit spure. The upright limbs in the top of a tree should also be shortened to keep the tree from growing taller. Fast-growing trees often shoot up numerous suckers in the top, and these should be trimmed in the same manner. If this practice is closely followed year after year dishorning will be unnecessary.

While pruning a tree all cankerous growth should be cut away. If any orchard has not ben properly sprayed, cocoons and collections of caterpillar eggs will be found, and this is an excellent time to remove them.

The importance of burning all brush cannot be overestimated. A pile of brush in the neighborhood of an orchard is a source of contagion that even constant spraying will find it hard to overcome. In pruning always be sure to cut close and leave no stubs. Many a fine tree has been utterly ruined by the presence of such stubs, as they will not heal over before moisture enters and rots them and eventually the whole trunk of the tree. When trees have been long neglected and are greatly overgrown, caution should be used not to prune too much in one year. Excessive pruning will almost always result in too much wood growth, which will surely reduce the yield of fruit, and in some cases stop it for several years. Besides, the remaining limbs will sometimes be so weak and unsupported that an ordinary crop of apples will often put them far enough out of shape to prevent them regaining their old positions, and thus they never grow properly.

On the other hand, if pruning is extended over three or four years and only a little wood taken out each year, these misfakes will be avoided. Instead of the main limbs being weak and unsupported, they will make a continuous, slow growth that makes for sturdiness and strength.—E. D.

This Tire Survives
Only the good survive. Time's old sickle strews the way with the worthless and the public ostracises the failures. Tire standards are ever higher and only the best tires can reach up to it. Tires that survive the ordeal of time and experience are the kind it pays to buy. Such are

Branches in all the leading cities of the Dominion

It is really unbelievable the amount of feed that can be consumed by a bird family. The digestive organs of birds are so constructed that they can contain and dispose of large quantities of feed, and while the parent birds seem always to be hungry, the young birds are even more greedy for feed. In an experiment to see how much a young robin would eat, it was found that this one robin devoured from 50 to 75 cutworms and earthworms in a day, and it did this for 15 days in succession. One day it ate 165 cutworms. This shows how much good work is done when the parent robins seek food for their little ones.

At the recent annual meeting of State of Maine Orchardists, many expressions were heard re the effectiveness of dusting the orchards. Dusting seems to be meeting with approval by those who have tried it. Orchardists are keen for more knowledge on this subject. Geo. E. Sanders is our best authority along this line; if interested, get in touch with him. His aldress is Annapolis Royal, N. S.

What Fertilizers are Best for the Patato Crop?

By S. B. Haskell

Three only of the thirteen different plant-foods necessary to the growth of the potato are ordinarily lacking in the soil. They are ammonia, the stem and stock producer; phosphoric acid, which in available form induces a good root growth in early spring and later hastens maturity; and potash, which influences the starch content and produces big yields.

When ammonia is present in sufficient quantity, we always get a good, vigorous growth of tops. A deficient supply is indicated by weak top growth and a rather sickly, yellowish color of the leaves, instead of the full, healthy green color indicative of vigor.

The ammonia needed by the potato crop may be furnished in several ways. The soil itself furnishes some for a time but, in general, the older the soil the less the supply of this plantfood. Clover sod turned under, or a leguminous green manure turned under, furnishes some, but just how much is difficult to say. Much depends on conditions. Manure if applied may furnish sufficient ammonia for the growth of the crop. Typically, however, the use of ammonia in potato fertilizer is necessary to most profitable production, almost regardless of the farm practices under which this crop is grown. We must always remember that the root system of the potato is relatively weak. It cannot rustle for unavailable plantfood as can rye and buckwheat or similar crops. Its energies must go towards laying up starch in the tuber, instead of towards foraging for plantfood.

Phosphoric acid is especially valuable in hastening the maturity of the potato crop, and in giving it a quick start. In cold sections the early maturity is an essential factor. The soil is patricularly deficient in phosphoric acid. Often it is the lack of this element alone which limits the size of the crops. Manure applied to the soil will not remedy its deficiency of phosphoric acid, for it is itself lacking in this element. This accounts for the high proportion of phosphoric acid recommended in potato fertilizers.

The potash needed may be supplied either by the soil, by manure, or by fertilizer. There are still some soils, particularly in the far west, that are so rich in natural potash that the addition even to the potato crop does not pay. Here again, however, practice the country over indicates that at least some potash should be included in practically all fertilizers for potatoes.

Almost universally the potato crop responds to the use of fertilizer potash. Some say that this is because the potato is a great starch producer, and must have potash in building up this most important of human and animal nutrients. Others say that it is because potato roots are poor foragers and cannot take up the cruder forms of potash present in all soils. After all, the precise reason makes little difference. The main thing, from the practical standpoint, is that on nearly all soils, potash increases the potato crop sufficiently to more than pay its cost.

Fertilizers on the market always have a guarantee attached showing the percentages of each plantfood. In the North these statements always come in the same order, the first figure referring to the percentage of ammonia, the second to that of available phosphoric acid, and the third to water soluble potash. Hence a "4-8-4" is one carrying 4 per cent of ammonia, 8 per cent of available phosphoric acid, and 4 per cent of potash.

Fertilizer analyses need not vary as much as the grower might suppose, to take care of different soil conditions. On the contrary, a few analyses seem to answer best the requirements of the crop in the different soils and varying climatic conditions.

Aroostook County, Maine, with its fertilizer tonnage of about 100,000 annually, uses normally not more than three or four different grades of fertilizer. "4-8-6", that is, a fertilizer with 4 per cent of ammonia, 8 per cent of available phosphoric acid, and 6 per cent of potash, was popular before the war and is now back in favor, despite the cost and scarcity of potash. "4-8-4" is used by some farmers, apparently with results at least equal to those obtained on the higher potash goods. We have reason to believe that the old "5-8-7" will come back strong in days to come, for with a short growing season, Maine potatoes must be fertilized as much as are the early potatoes of the eastern shore of Virginia.

The problem in one case is to get the potato onto an early market, and in the other, to ripen the potatoes before an early frost. There are some farmers who demand a fertilizer with but 3 per cent of ammonia. We do not anticipate any great demand for goods of this grade, but the "3-8-6" and "3-8-4" are both useful in supplementing manure applied to potatoes.

It is of interest to note that fertilizers for potatoes are more or less similar under conditions apparently far different. The Long Island potato growers use precisely the same analysis as do their Maine brothers. In New Jersey the most popular grades have been the "4-8-4" and "4-8-6." South, in Virginia, we find the "7-6-5," but here earliness is such a prime essential that a farmer is not going to run the risk of a shortage of nitrogen.

Naturally, as we go West, there is less uniformity. Opportunity for experience has been too limited to give a sound basis for standardization. The soils are still rich in nitrogen compared with eastern soils. Yet even here there is evidence of a drift toward fewer formulas, and it is gratifying to note that the sale of misnamed potato fertilizers, such as our old friend, the "1-8-1," a fertilizer that was never meant to grow potatoes, is becoming less.

It is difficult to predict as to the future fertilizer use in these newer potato regions. The Soil Improvement Committee, in its campaign for fewer grades of better fertilizer, recommends a series of fertilizer containing 3 per cent of ammonia, 10 or 12 per cent of available phosphoric acid, and the potash varying with the soil. A "3-10-4" is suggested for potatoes grown on sandy land, particularly where it is known that the soil is deficient in available potash. On loamy soils, or where manure is applied directly to the potato crop or to the preceding crop, a "3-10-2" is suggested, the thought being that under these conditions the soil and manure, one or both, will furnish part of the needed potash. Finally, for those few cases where potatoes are grown on heavier soils, as on clays or clay loams, or where large quantities of manure are used, a "3-12-0" is suggested. Probably the greatest value of this last analysis is for use in connection with manure. Even here, however, there are indications that at normal prices fertilizer potash on potatoes will pay and pay handsomely.

It must always be remembered that these suggestions are based on growing potatoes as they should be grown —in a good rotation containing clover. Even a heavy application of any one of the foregoing analyses fails to furnish sufficient ammonia to grow what we call a heavy acre yield, part of this needed ammonia must be obtained either from barnyard manure or a good, heavy clover sod turned under. For a time, naturally, any new soil will furnish sufficient of this plantfood to the crop—but in all the great potato counties of the country, excepting only those in irrigated regions of the west, this time is past. Clover nitrogen and manure nitrogen must now be supplemented with fertilizer nitrogen.

After all, since potatoes are always potatoes and respond very similarly to treatment, the world over, the problem of what to use is comparatively simple. More difficult is the question of how much to use, for here must be taken into consideration the question of price of crops and cost of fertilizer. This will be considered in a succeeding article of this series.

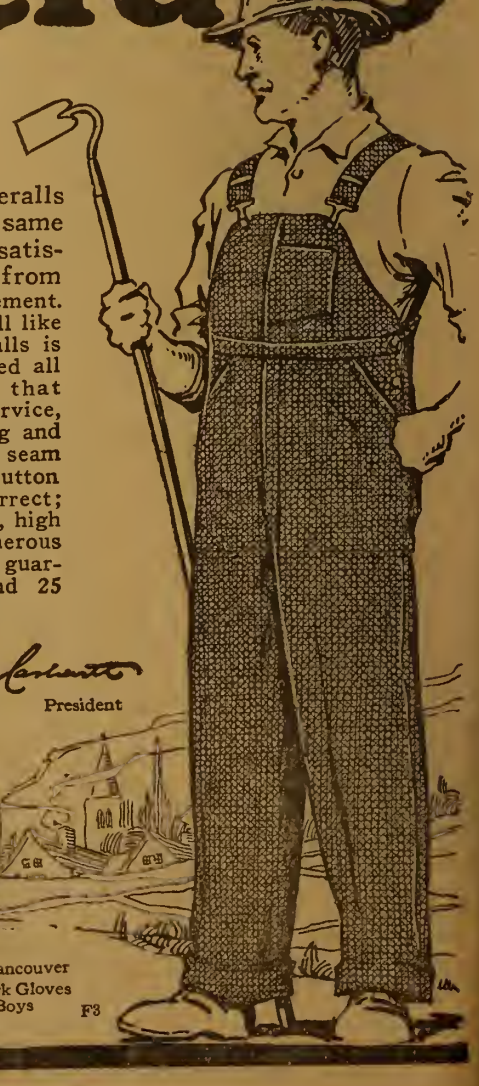
Carhartt Overalls



MY Carhartt Overalls bring you the same solid sense of satisfaction that you get from the use of a good implement. The one big thing you will like about my Carhartt Overalls is that they are thoroughbred all the way through, and that means thoroughbred service, neat and finished tailoring and heavy denim cloth. Every seam is double stitched; every button is reinforced. Sizes are correct; extra-large handy pockets, high back, high bib and generous seat. Behind it all is my guarantee of satisfaction and 25 years of knowing how.

Uncalled For Snubs Refuted

We read with a great deal of interest, in the April 21st issue of The United Farmers' Guide, Mr. W. B. Fawcett's eulogy of our good friend, Mr. S. B. Chute, farmer, pHilosopher, and financier, as Mr. Fawcett terms him.

Mr. Chutes' many friends in Nova Scotia will be pleased to know that he is still going strong in climbing the ladder of success in Florida, a feature so well demonstrated by him in Nova Scotia. We believe, however, that Mr. Fawcett was somewhat carried away with Mr. Chutes' hospitality when he says:—"He has already accomplished more for the practical, profitable development of Nova Scotian agriculture than the whole system of Experimental Farms and Institute farm lecturers inaugurated about (thirty years ago) by Professor Robertson, and maintained ever since at the public expense."

The Maritime Farmer does not believe Mr. Chute attributes this wholesale credit to himself, despite the fact that he has been a power for good in the promotion of the fruit growing industry in Nova Scotia.

The fruit growing industry is not the only industry in that province that is linked up to the farm. We wish to say in defence of the Experimental Farms and the good work done throughout Canada by Dr. Robertson, that there are hundreds of farmers who are not interested in fruit growing, who have never heard of the foremost lights in apple-growing throughout the Annapolis Valley, who have been benefited by the lessons gleaned from investigators at the Experimental Station. despite Mr. Fawcett's contention to the contrary.

Mr. Chute and many others of his fellow workers in apple growing have learned a great deal from the reports issued by men who spend years in investigating various phases of the fruit growing business at some of these experiment stations. Mr. Chute was always on the outlook for new ideas, and when such came his way, no matter from what source, if they looked sane and sound and appeared an improvement on his customary methods, they were tried and adopted or discarded according to their merits. In this way Mr. Chute made steady progress and achieved fame, while many who were not open to ideas from investigators remained stock still or retrogressed.

Mr. Fawcett gives Mr. Chute a boost for the position of the head of the Department of Agriculture for Nova Scotia when he says: "Just imagine the commercial revolution that would sweep Nova Scotia should ber farmers take charge of affairs and place S. B. Chute at the head of Agriculture, instead of the two pence ha'-penny policy of raising "one more pig" on five dollar feed or growing potatoes with cracked limestone rock that is not woth the freight. His first move would to import genuine high grade fertilizers in ship loads from the cheapest markets available, with the credit of the province behind him; he would supply every farmer all he would venture to buy at cost and expense, with ten months' credit to repay them."

We have no doubt Mr. Chute would make an excellent administrator of the agricultural affairs of any province, because he goes into his various undertakings with a clear brain and willing hands, and the inevitable result follows. We do not believe, however, that Mr. Chute is after the position, he has too many interests at stake to devote any time to a position the incumbent of which is not too well paid.

The present incumbent, Dr. Cumming, in common with hundreds of other wide awake farmers and investigators, recognize that live stock growing is the back bone of successful farming in the Maritime Provinces. The "One pig more" slogan was absolutely necessary to accomplish the results for which it was adopted. The one grew to mighty numbers, and the boys over there did not lack for food. The boys who have been under Dr. Cumming's tutorship at the College, and their fathers who have kept in close touch with them in their every day operations on the farm, best know what Dr. Cumming and those associated with him have done and are doing for Nova Scotia, in the upbuilding of her great agricultural industry. It ill behooves an outsider, who is not conversant with the work these men are doing, to throw out any sneers along this line. It is not well received by the Maritime Farmer nor its thousands of readers in Nova Scotia, as well as those of our readers in other provinces, who have every respect for Dr. Cumming and his work, both as Secretary for Agriculture and as head of the N. S. A. C.

Mr. Fawcett evidently has not been keeping in close touch with investigational work re the use of ground limestone, when he says "it is not worth the freight." Dr. Cumming has never advocated ground limestone for potato growing, but ground limestone is proving a mighty factor in the Maritime Provinces for the production of clover, the sod of which is held in such high favor by our potato growers as a suitable bed for the growth of potatoes. There are hundreds of farmers in the Maritime Provinces who have tried ground limestone and achieved results they were never able to achieve by the use of expensive fertilizers.

To our mind, drainage and the use of ground lime to sweeten the soil, are two big foundation stones in our agricultural policy that are well taken, and that must be attenedd to before spending time and expense on expensive fertilizers. The fertilizer policy outlined by Mr. Fawcett may be a good one, but we have our doubts. When drainage and liming are properly attend to it will not take so much expensive fertilizers to produce the crops. The two foundation stones in question are being ably advocated by Dr. Cumming and his staff, and we believe he and they are on the right track.

KEEP HENS FROM COLD

For maximum egg production during the winter months, the hens must be confined to quarters. The poultry-not be allowed outside range but must keepers who get the best egg production during the winter months shut their hens in their houses as soon as the weather gets bad in the fall, and keep them in until spring comes. If the birds are allowed to run at large during the winter months they will spend most of the time standing around behind buildings and windbreaks, trying to keep warm, when they had much better be in the poultry house scratching for feed. Turning the birds out even on pleasant days during the winter months will cause slumps in the egg production. This is probably due to the fact that when the birds get outside, the ground is cold and wet, and this produces enough shock to affect the production of the birds. If the hens are to be kept inside for several months, the poultryhouse must not be overcrowded. Each hen should have at least two and a half or three square feet of floor space.

Some attention is necessary with birds that are confined, to insure plenty of exercise. One method of providing exerise is by feeding all grain in a straw litter, covering the entire floor to a depth of not less than 12 inches. Another good means of keeping the birds busy is to hang cabbage, turnips, beets or other green stuff just above the bird's heads in the house, so that they are kept busy jumping to get this material.

Primrose is different from all other cream separators in several very important points.

Here is one:

PRIMROSE is the *only* separator with two wide-open cream outlets. There is no cream-wasting screw in the path of the cream. The regulating screw is in the skimmilk outlet. Adjusting it there, you get the exact density you want—and all your cream goes out of the two always-wide-open cream outlets. This practical, sensible, Primrose separator improvement is saving cream and money that cannot be saved by any other separator. We stand behind this statement. Primrose efficiency has many other good reasons.

WHITE DIARRHOEA DISEASE SCOURGE OF CHICK REARING

By Dr. L. Van-Es, of the Department of Animal Pathology, University of Nebraska.

Under the name of white diarrhoea poultry raisers include more than one disease in which abnormal bowel conditions are a more or less constant symptom. There are many of those conditions about which but little is known, but quite fortunately the one which is the source of the greatest losses is now fairly well understood. The disease is now commonly called bacillary white diarrhoea, because its specific cause is known to be a bacillus (Bacillus pullorum). This name distinguishes the disease from the others which are as yet not so well known.

In its most conspicuous form, the disease is particularly fatal to chicks recently hatched. In fact, most of the losses occur during the first two days after the chicks leave the egg. After they are four or five days old their susceptibility becomes reduced to a minimum.

Symptoms of Disease

The symptoms of the disease vary more or less and this variance sometimes give rise to some confusion. On the whole, however, the following symptoms are fairly constant, even if they may not be all present in the same outbreak.

In many cases the young chicks die within a day or so after hatching. In those nothing very conspicuous may be observed. The chicks are weak, dull, lack the normal vitality, and simply die, apparently as a result of this condition. This is quite important as not uncommonly poultry raisers otherwise well acquainted with the disease under consideration, are inclined to believe that some other cause is responsible for their losses.

When the chicks do not die during the first days of the disease, the abdomen becomes enlarged and produces backward, giving them the appearance of being "short-backed" as poultrymen call it. In such a condition the chick may live for several days. The virulence of the infection probably has much to do with the duration of the disease. Not many survive, and most of the infected birds succumb before they are three or four weeks old. The few which recover are apt to remain stunted, scrawny, with imperfect feathering, although a small number may regain a certain degree of vigor.

Internal Symptoms

When we carefully open and examine a chick recently lead of the disease, we uscally find the crop either empty or filled with a viscid fluid.

The same is found in the gizzard which, along with the intestines, is marked by an unusually pale color. The latter are commonly empty, although occasionally there is a dark grayish or brownish content. In the blind guts we may meet with a cheesy matter somewhat firm in consistency.

The liver is commonly pale or of dull ochre color, marked with streaks or patches of red. The organ is soft and friable and in the more chronic cases we often meet with a distended gall bladder.

The other organs ordinarily have a normal appearance with the exception of the almost constant pale color.

There is nearly always present in the abdominal cavity an unabsorbed yolk. Several authors regard this as a phenomenon of diagnostic importance. It ranges in size from that of a pea to a normal sized yolk. The color varies from yellow to brownish green or almost black. It may be gelatinous, watery or cheesy in character.

Such then is the disease which is capable of destroying great numbers of young chicks almost as fast as they can be hatched by incubator or by natural methods. We must now inquire into its natural history. On this point careful research has thrown considerable light.

They should understand that the diarrhoea is merely one result of the invasion of the chick's body of the germ. In many instances, the latter is capable of causing death before the typical diarrhoea has had time to develop. In the majority of the cases, however, the latter is a rather marked feature.

Then there is noted a whitish, creamy, sticky bowel discharge, occasionally streaked with brown. It may be quite profuse, but often the evacuated material is but slight. It has a tendency to stick to the down of the vent, which may thus become effectually sealed. Often it seems that the evacuations are painful because the chicks will as it were utter a cry of pain when the excreta are being voided. In other cases the chicks peep and chirp almost constantly. The little birds have little or no appetite; they apear sleepy, dull and inclined to remain quietly under the hover. Their feathers are ruffled, their wings begin to droop and they keep their eyes closed as if life has no further interest for them.

Usually they die in this condition, but a few manage to survive a while longer. Such become very poor and so extremely weak that often they are found lying about in a perfectly helpless condition.

Source of Infection

It was found that the young chicks became infected when during the incubation period they are still contained in the egg. It was further discovered that the egg became infected before it is laid and that the hen which laid it is the real source of infection.

This important feature may come about in two ways. In the first place the hen, when a chick, may have survived the disease and have remained an infection carrier. It was shown that birds surviving the disease contain the germ during the rest of their lives. On the other hand, perfectly normal birds are capable of taking in the germs along with food and drink which was contaminated with them through the dropping of sick chicks.

Scarcely of less consequence is the fact that the organism once introduced into the older fowls will localize itself in the sexual glands, the testicles and the ovaries. The latter are especially important in this connection because, while they are diseased, they continue to form eggs, to be sure in a reduced number, but nevertheless eggs of normal appearance otherwise. Such eggs are mainly responsible for the outbreaks of the disease. All the eggs in a hatching may not contain the germs, but the chicks hatched from a few will be capable of infecting the others within a short space of time. The ovaries of the infected hen always contain the germs of the disease, and the eggs derived from them do so with a high degree of constancy.

The infected ovary may be recognized as such upon careful examination. It is composed of both normal and abnormal ova (eggs). The normal ones are like the ones we meet in healthy chickens. As a rule those vary considerably in size. In the abnormal ones this variation in size is not so marked and in one ovary we may find many which are nearly alike in volume. The larger ones distinguish themselves from the normal ones by being less rounded. They have a tendency to be irregular in outline and angular in shape. Their surfaces are more or less mottled. In place of the uniform yolk yellow of the normal ova, they range in color from a light yellow to a dark greenish brown. They are more firm than the healthy ones and consist largely of a solid cheesy material and a clear yellowish fluid. The germs of the disease are always present in such ovaries.

Preventive Measures Important

In dealing with this disease we must especially depend upon preventive measures. Those may be divided in general and specific ones. To the former belong sanitary measures, such as cleanliness and disinfection of incubators and brooders, proper feeding, the selection of vigorous breeding stock, and protection against cold. The more specific preventive measures are directed against the introduction of the disease and its suppression after this should have taken place.

As a rule the disease is introduced by the use of infected eggs for hatching purposes. It is, therefore, extremely important that only eggs be selected from such flocks or poultry yards where there has been no trouble with white diarrhoea. It is important that when chickens are killed for food, the ovaries be examined for the diseased condition described above. When diseased ovaries are found, it would be better not to use the eggs coming from the flock for hatching purposes. It may even be advisable in certain cases to kill off the entire flock and make a fresh start with uncontaminated fowls after a month or two. Fowls having diseased ovaries are fit for table purposes.

It is possible to detect the infection carrying fowls by the bacteriologic examination of their eggs or by certain blood tests, but it is doubtful that, in view of the cost of these procedures, those methods are very practicable at this time.

Cannot Rely on Medicine

When the disease once has been introduced on a cetrain farm, it may be advisable to suspend further hatching for a time, although with good care this may not be imperative. At any rate all utensils used in the business must be carefully disinfected after the removal of the chicks, and eggs of an unquestionable source must be procured for the next venture.

The brooders in which an infected lot of chicks are kept must be cleaned and disinfected daily. The floor should be sprinkled with such a substance as alfalfa meal, which facilitates the cleansing process. The chicks should be divided in as many lots as are convenient or practicable. As soon as any chick shows evidence of sickness it should be removed, before its droppings can increase the infection danger.

There are no medicines upon which reliance can be placed, but it seems that the use of sour milk as a food exercises a favorable influence upon the mortality rate. Of course, a sick chicken hatched out of an infected egg cannot be saved by sour milk, but it is possible that the latter substance may prevent harm being done by germs picked up with the feed. It is probable that the only way in which sour milk has reduced the mortality in some outbreaks is merely by being an excellent, wholesome and nutritious food; but however this be, its use is recommended to those who are confronted with this disease.

Food and water must be absolutely free from any contamination. They should be given regularly and in such

a manner that the droppings of any sick chick cannot gain access to them. When fresh clean water is used and ocered in clean containers, it is not necessary to add any antiseptics, while, furthermore, the latter are not particularly safe for such delicate creatures as decently hatched chicks.

CLEANLINESS IN POULTRY HOUSE

It requires constant effort to keep the hen house clean and sanitary at all times, but the extra work that it will take will well pay one for his trouble. It is not sufficient to keep the house clean in the summer, but in the winter when the fowls are confined to the piultry house most of the time, it is more difficult.

Then, the litter will soon become damp and packed and will have to be changed frequently as the birds scratch the best in loose litter. Also, there will be more droppings and they will freeze and be harder to remove. The birds being in close quarters and not having the exercise that they are accustomed to will be more apt to become diseased and lead to insanitary conditions.

The house should be constructed with a view of keeping it clean easy. If dropping boards are used it takes but a little time to remove the manure which is quite difficult if allowed to drop on the ground. Cement floors are easy to keep clean although not liked by some persons. All poultry appliances should be made removable so that they can be taken outside, cleaned and disinfected in short time.

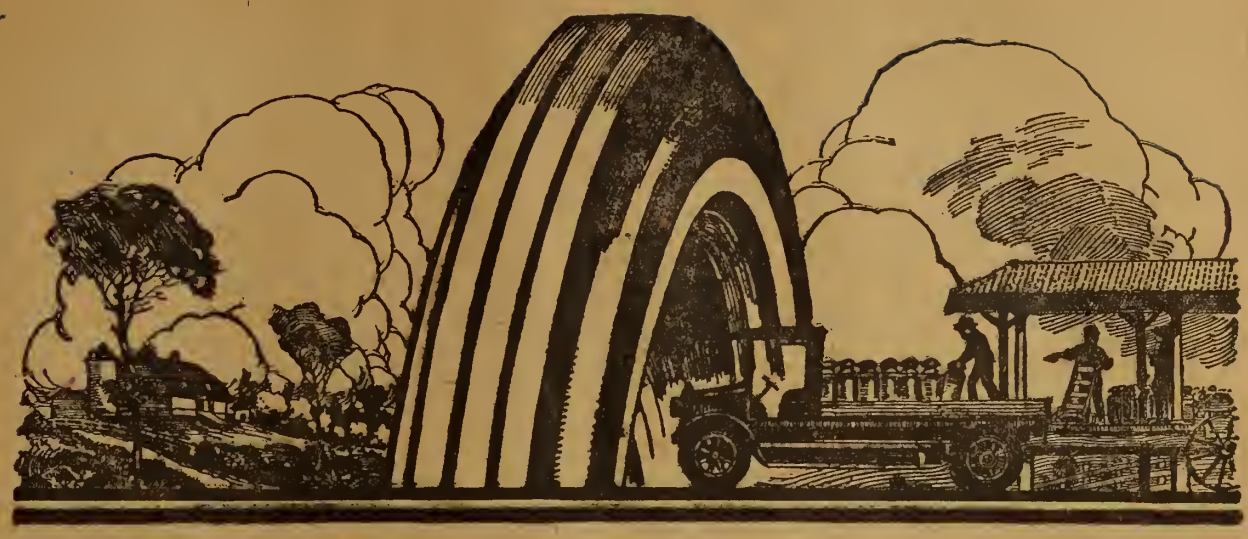
A poultry house that is not watched soon becomes a harbor for lice. It should be cleaned and disinfected at frequent intervals. Sanitation is necessary to success with poultry.

O. L. I.

PROF. W. H. J. TISDALE JOINS STAFF OF WOOL GROWERS

Prof. W. H. J. Tisdale, Animal Husbandry Department of the University of Saskatchewan, Saskatoon, has resigned his position at the University to acecpt a position with the Canadian Wool Growers, Ltd. Prof. Tisdale, while he will be located at the Head Office of the Wool Growers, will have all Canada as his scope in sheep and wool work, and he is well recognized as an authority on Sheep Husbandry.

Prof. Tisdale was born in April, 1891, and raised on a farm near Paris, Ontario. He received his early education in the Public and High Schools of that district and entered the Ontario Agricultural College in 1909, graduating from there in the spring of 1913 with the B.S.A. degree. Dur his four years at College, he took an active interest in organization and executive work, being president of his class, president of the Athletic Association and class representative on the Literary Executive. In his final year he was a member of the Live Stock Judging Team to represent the college at the Chicago International. By the vote of his classmates and with the approval of the faculty, he was awarded the '05 Scholarship at graduation. Upon gradution, he took a position with the Ontario Department of Agriculture as District Represntative for Peel County. In 1914 he went west to join the staff of Saskatchewan University as Assistant Professor of Animal Husbandry, attaining a full professorship in that Institution in 1919. During the six years spent in this later position he has given spocal time and attention to the sheep industry of Western Canada.



These Tires Will Suit Your Loads and Your Roads

On farm and ranch and country road—on heavy hauls to town—on pleasure bent when work is done—DOMINION TIRES will give you long and satisfactory service.

DOMINION TIRES

ARE GOOD TIRES

Among experienced motorists, they are known as "greater" tires—because they give greater service, greater mileage, greater pleasure in riding.

DOMINION INNER TUBES mean perfectly balanced tires. Carry an extra inner tube in the car, as well as a supply of DOMINION TIRE ACCESSORIES — which all Dominion Tire dealers have in stock.

Dominion Tires are sold by the best dealers.

MORE LIVE STOCK NECESSARY

On the basis of live stock per unit of human population there was practically no comparative increase in the production of cattle, sheep and hogs in Canada during the past decade.

Statistics show an increase in the live stock holding in Canada in 1919 as compared with 1909, of approximately 2,850,000 cattle, 716,000 sheep and 1,127,000 hogs, while a comparison of the human population for the same years indicates an increase for 1919 over 1909, amounting to approximately 2,315,000 persons.

The following table aptly illustrates the statistical situation:

Class	No. Head of Human 1909	Per Unit Population 1919
Cattle	1.08	1.12
Sheep	.40	.38
Hogs	.44	.45

If domestic consumption per capita had remained constant, the volume of the export surplus during 1909 and 1319 would have been about equal. Statistics show, however, that the exports of animals and animal equivalents during 1919 were in excess of those of 1909, to the extent of 596,800 cattle, 53,990 sheep and 1,171,857 hogs. The increase by percentages were: cattle 325.81 per cent.; sheep, 1.34 per cent., and hogs 115.00 per cent.

The inference is that the growth in live stock population has not been rapid enough to allow of a wider margin of exports without infringing on normal domestic requirements.

Recent marketings have been in excess of normal chiefly owing to unfavorable feed and weather conditions.

Any further increase in the volume of exports will clearly still further encroach upon domestic consumption of meats, except on the basis of increased production of live stock.

COW SENSE

A man puts $1 worth of food before a good purebred cow and is rewarded with $1.10 worth of milk—that's labor.

Another man takes the same cow, puts $1 worth of balanced ration before her, and secures $1.50 worth of milk—that's skill.

The third man secures her and breeds her to a heavy-production-bred bull—that's good judgment.

The fourth man buys the heifer calf—that's good business.

The early lamb for the early market, the feeder, the breeder, or for the show ring.

SUNNYSIDE STOCK FARM

Ayrshire Cattle and Chester White Swine

Present offering: one bull two years old, two aged seventeen months. Also a number of younger ones. Females any age. This herd is bred for production having the combined strain of "Jean Armour" and "White Heather"

"YOU SEE IT'S A MARITIME FENCE"

Maritime fences will stand the severest tests, because they are built throughout of extra heavy hard drawn No. 9 steel wire. The superior stretching power of No. 9 wire keeps the strands from snapping under heavy strains or hard frosts. Each fence is thoroughly galvanised and will sturdily resist the rust and rot of weather.

STANDS THE TEST OF MAN, BEAST, WEATHER and TIME

The strands and stays are firmly gripped at every join by our special time tried and tested never-slip lock. Even after years of hard service, Maritime wire fence retains its sagless shape and sightly appearance. All Maritime Fences are carefully inspected and rigidly tested before leaving the factory. When you buy it you know you have got something that is bull strong and hog tight, something that will withstand greater strain than it is ever likely to receive.

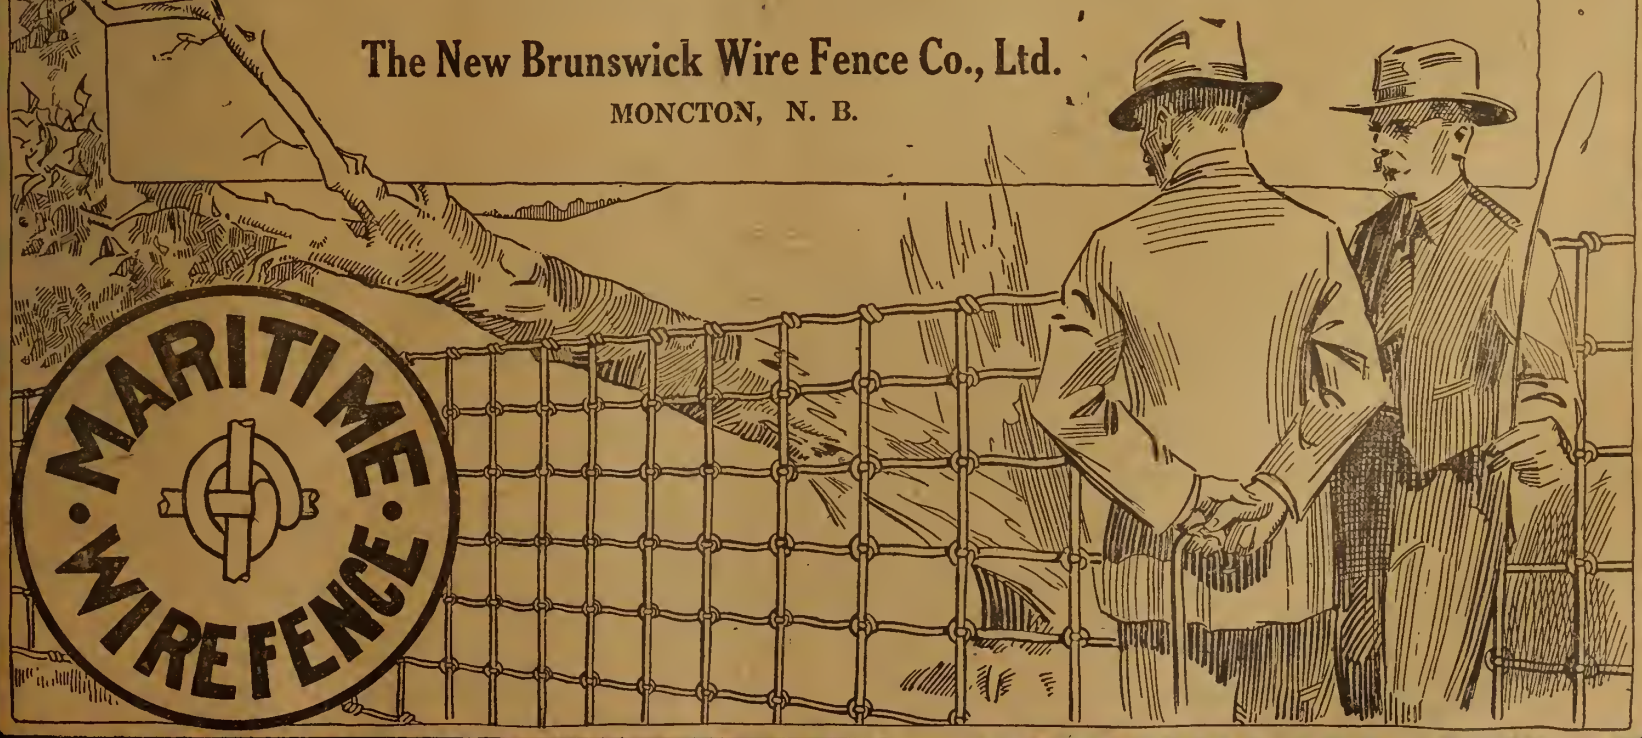
Before you buy fencing it will pay you to first learn what the Maritime has to offer in the way of real fence service.

For sale by agents and dealers in nearly every section.

If you don't know the local dealer, write to us direct.

The New Brunswick Wire Fence Co., Ltd.

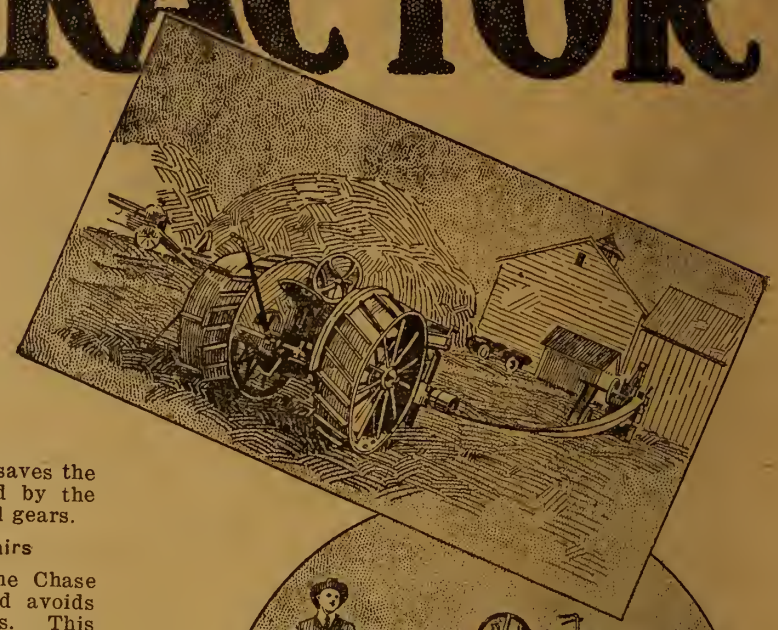
MONCTON, N. B.



CHASE TRACTOR

Built Without—— Differential Gears

Pulls Itself Out of Trouble---Uses Less Kerosene---Avoids Tie-Ups and Repairs



Because the Chase has no differential gears it avoids many frequent causes of tractor trouble.

Understand how differential gears affect the operation of a tractor and the superiority of the simple design of the Chase is clear.

Tractors with differential gears can do their best work only on a straight-away pull on level land. The moment one wheel meets an obstacle, the differential throws all the power into the other wheel, so, quite often you see such a tractor with one rear wheel dead and the other spinning. That happens when the tractor gets one wheel in a mud hole. The very time when extra driving force is needed the differential gears rob the motor of its power to move the tractor.

The same thing occurs in a lesser degree in all ploughing work. For, the side-draft tends to place more load on one wheel than on the other and the differential gears throw the power into the other wheel.

More than half the time the Tractor with differential gears is, in effect, a one-wheel-drive tractor.

Pulls itself out of trouble

The Chase Tractor, having no differential gears, drives both rear wheels with equal power. When the Chase gets into a hole the driver can use both rear wheels to pull out. When obstacles are met, the Chase rides over them. On side-hil ploughing or on level ploughing the side-draft cannot pull the Chase from a true course. The Chase pulls its load more evenly —is easier to control—is more constantly "on the job."

Uses less kerosene

This no-differential feature saves kerosene for two reasons. 1st. Gears waste 10% of a motor's power. The direct drive of the Chase saves that 10%. In addition, the Chase saves the power that would be wasted by the uneven pull due to differential gears.

Avoids tie-ups and repairs

Because it pulls evenly the Chase saves wear on bearings, and avoids strain on all working parts. This means less adjusting and less replacement of parts. It means more hours "on the job."

Judge the Chase on its construction and its performance.

The Chase Tractor is a simple sturdy machine.

It has fewer parts than other tractors —hundreds less than most tractors.

It is a tractor that a farmer can handle easily either in the field or for Belt power, and because of its simple construction and the accessibility of its parts, one that he can attend to with the least trouble and loss of time.

It is a low-riding tractor—gets under trees in orchard work, has sure footing on side hills.

The Chase turns in a narrow radius. By throwing either rear wheel out of gear a sharp turn can be made.

The motor is the heavy-duty tractor type, built to do continuous service without overheating to give high efficiency on kerosene or low-grade gasoline, to avoid the waste of lubricating oil, which is customary when kerosene is used in ordinary motors. The man who understands and delights in fine machinery should examine the Chase Tractor and watch it in action. The more he knows about tractors, motors and machinery, the greater respect he will have for a piece of engineering construction like the Chase Tractor.

Write for literature and information. Find out, at once, where you can see the Chase Tractor and investigate for yourself the claims we make for it.

BEEMAN
One-Horse Garden Tractor

Does everything that one horse can do in garden or field work—does it better and faster.
Cultivates as close as a hoe—even in 12-inch rows. Ploughs, harrows, seeds. Hills potatoes. Ideal for market gardeners. Invaluable to farmers.

Brighten your Home and Lighten your Housework

No matter where you live, all the comforts and conveniences of power and electric light can be yours.

The "F" Power & Light Plant

means brilliantly lighted rooms at the touch of a button—stairways, cellar, pantry, all as bright as day in a second. No lamps to fill, no chimneys to clean, no danger from oil cans, matches, or overturned lights.

Better light saves the eyes and makes the home more cheerful and attractive to every member of the family.

The power from this plant means a wonderful saving of work around the house. It runs the pump, washing machine, churn, cream separator, and other light machines, and it does every job easily and quickly. It is so simple that it requires practically no attention to operate.

The "F" plant also supplies current for electrical appliances, such as electric iron, vacuum cleaner, toaster, percolator, fan and heater.

The advantages of the "F" Power and Light Plant in the home appeal to every rural family, and its low price and economy in operation, enable most every house owner to enjoy the great benefits it makes possible.

Let us mail you a catalogue, which will give you complete particulars of the biggest possible improvement in farm house, rural residence, or summer cottage.

Artistic and Economical

There is a beauty and individuality to a roof covered with Brantford Asphalt Slates that appeals to all lovers of the artistic. There is an economy in their low cost per year of service that appeals to all seekers of a sound roofing investment.

Brantford Asphalt Slates

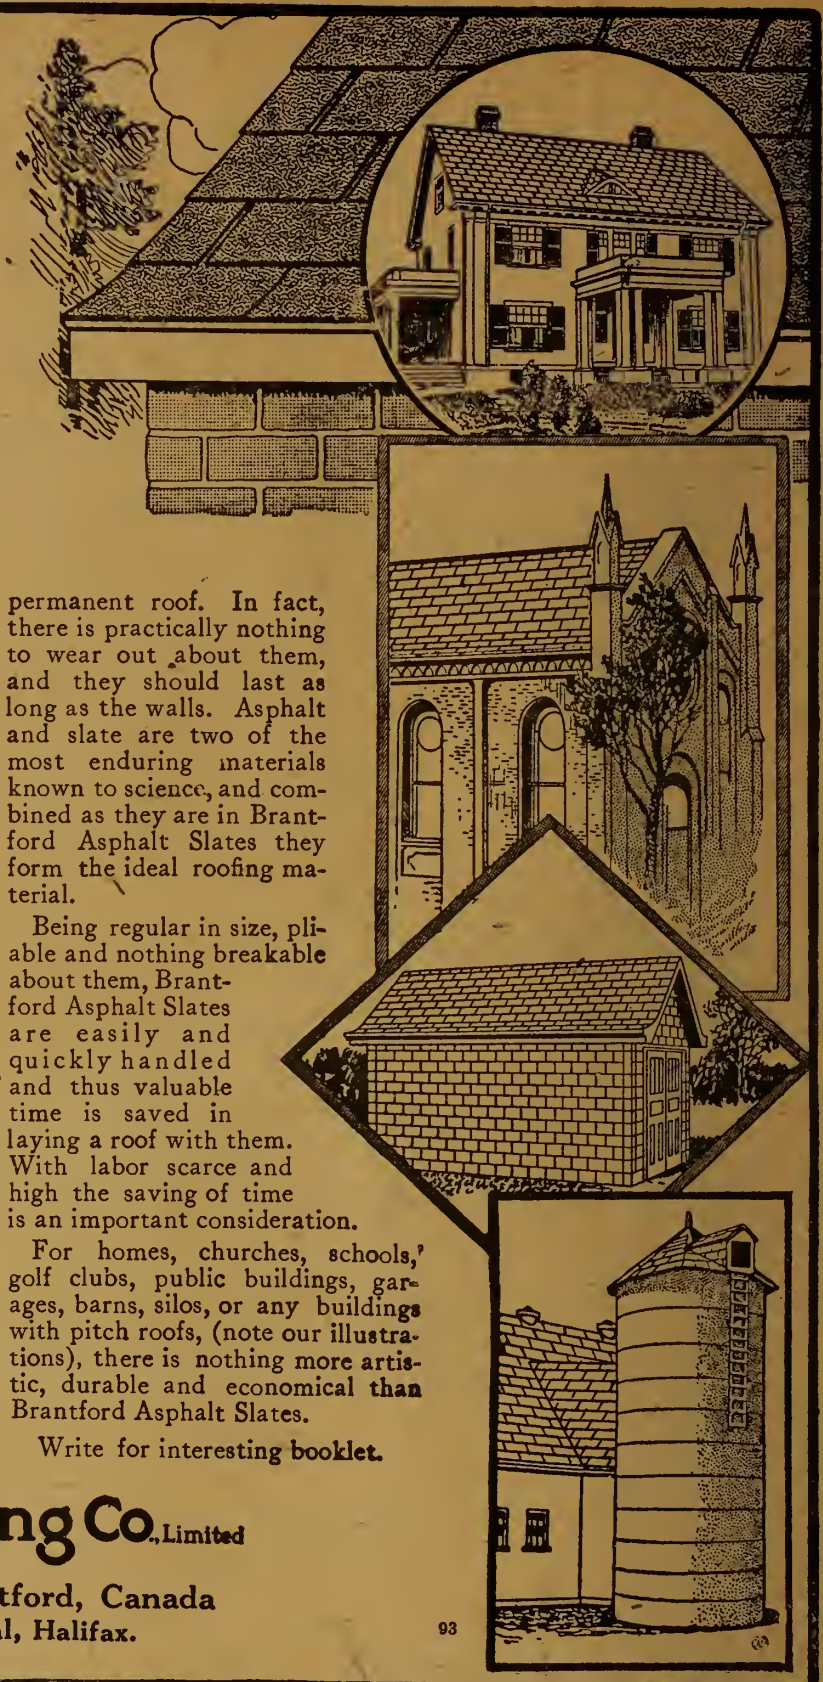
are made of a special grade of long fibred felt thoroughly saturated and coated with asphalt, on top of which is a surface of crushed slate.

The asphalt is a blend of soft and hard asphalts, tempered to resist the extremes of the Canadian climate. The slate is the real quarry slate and its colors of reddish brown and dark green are the natural colors of the slate and are therefore unfadeable. Brantford Asphalt Slates never require painting. It would be hard to imagine a more durable roofing, let alone make one.

Brantford Asphalt Slates are absolutely water-proof. They do not absorb moisture, therefore are not alternately swelling and drying out.

They are wonderfully fire-resistant. There is no record of a fire ever starting on a roof of Brantford Asphalt Slates. You can put a whole shovelful of red hot coals on a roof of Brantford Asphalt Slates and, while the heat from it might melt some of the asphalt, the slates would not ignite.

The cost of these slates is very moderate—and if you have an old, leaky roof you can reroof it with Brantford Asphalt Slates without requiring any additional braces. And the slates will make a completely watertight and permanent roof. In fact, there is practically nothing to wear out about them, and they should last as long as the walls. Asphalt and slate are two of the most enduring materials known to science, and combined as they are in Brantford Asphalt Slates they form the ideal roofing material.



Being regular in size, pliable and nothing breakable about them, Brantford Asphalt Slates are easily and quickly handled and thus valuable time is saved in laying a roof with them. With labor scarce and high the saving of time is an important consideration.

For homes, churches, schools, golf clubs, public buildings, garages, barns, silos, or any buildings with pitch roofs, (note our illustrations), there is nothing more artistic, durable and economical than Brantford Asphalt Slates.

Write for interesting booklet.

SOFT OR PIEBALD WHEAT

It is well known that, when grown on certain soils and especially in certain seasons, wheat instead of being dark and translucent, is pale or spotted with patches of light color. If this condition is very marked the wheat is called "soft," and if it is less evident the term "piebald" is often used. In Kansas and some other States the phrase "yellow berry" is employed to designate the same condition. There is considerable misapprehension in regard to softness in wheat. Some varieties, such as Prelude for instance, are extra hard in their nature and very seldom produce soft kernels, while others, such as White Russian, are essentially softer. But most of the popular sorts, though usually hard in character, become soft under special conditions of soil and climate. Even the extra hard wheats of the Durum class, such as Wild Goose, sometimes show softness.

Soft kernels of wheat contain a lower proportion of gluten and a higher proportion of starch. The interior of a hard kernel is horny and translucent, while the interior of a soft kernel is whitish and opaque. As bran also is translucent, the soft kernels are paler than the hard ones. The bran itself, however, does not change color when the wheat becomes soft and the term "yellow berry" is quite misleading. A soft sample of a so-called red wheat (which is really reddish-brown, rather than red, in color) is not yellowish but pale reddish-brown. The popular idea that Red-Fife wheat turns into White Fife when it becomes soft is enteirely erroneous; the difference between these two varieties lies only in the color of the bran. White Fife is just as hard a wheat as Red Fife though of a different color; yellowish rather than reddish.

Softness is the outcome of peculiar soil conditions especially in regard to soil structure and the quantity of moisture present. Land from which trees have recently been cleared is particularly liable to produce soft wheat. It is also well established that in countries where the summer is rather long and where the temperatures are moderate the wheat is usually softer than in districts where the temperatures are moderate the wheat is usually softer than in districts where the summer is short and where great extremes of temperature occur. A full explanation of the causes has not yet been arrived at.

It is generaly believed that soft wheat is inferior in quality to hard wheat for bread making; this is usually true, provided the samples compared belong to the same variety. However, some soft varieties are superior to some hard ones. For milling purposes hard wheat is preferred as it is easier to handle and usually gives better satisfaction to bakers who desire to make extremely light bread. For pastry and cake, flour from soft wheat is better. Hard wheat being more in demand usually brings a higher price than soft wheat. As a rule, therefore, farmers whose wheat is soft suffer a financial loss on that account. Such wheat, however, (if of a usually hard variety) is perfectly good for seed purposes, because the softness is not inherited.

Not very much is yet known as to the best way to overcome the tendency of any soil to produce soft wheat. To a certain extent this is doubtless beyond control, but it appears probable that cultivation and especially the ploughing under of sod will produce harder wheat. This could be expected particularly if the land under tillage were formerly covered with trees.—E. C. Saunders, Dominion Cerealist.

In the business of breeding and raising hogs, the foundation for success is in the proper feed, care and management of the brood sow. Unless she gets the right attention, large and thrifty litters can not be expected.

More Butter from your Cows

SEPARATING with a Renfrew allows you to get all the cream there is in the milk.

When you feed expensive feeds to get more milk you do not want to waste your effort by losing a lot of cream. Thousands of dollars are lost to Canadian farmers and dairymen through the fact that many separators do not skim properly and the extra cream goes off into the Skim Milk Pail. The

Renfrew

CREAM SEPARATOR

gets the maximum amount of cream. That means more butter, greater profits, or a saving of money otherwise lost. "A good separator is cheap at any price."

The Renfrew is 100 per cent. Canadian. It is an investment that saves more money than any other machine used on the farm. The Renfrew has demonstrated in tests at different Dairy Schools that it skims closer than any other separator made.

The Renfrew is endorsed by leading Government Dairy Schools, dairymen and general users.

It is easy to keep clean. All working parts are enclosed in an airtight casing. No oil can leak out and there is obsolutely *no appearance of oil on the outside of the separator.* Oiling is only necessary once in three months.

The Renfrew is the only separator with an interchangeable capacity.

The milk supply can is placed low, which is a great convenience and thoroughly appreciated by women. The crank for turning is high, which makes it easy to turn without stooping.

Every feature of the Renfrew Separator is a feature that will save you money that is now being lost.

The Renfrew is sold in foreign countries as well as in Canada and wherever it goes it backs up its record as a "triumph of Canadian skill."

That Broad National Policy

Absolute Exclusion of the Maritime Provinces in Wheat Prices--Quebec, Ontario and West Get Boosts--Premier Drury Rebels --Farmer's Sun Against Price Control

The Maritime Farmer has consistently advocated the organization of the farmers of the Maritime Provinces with a view to forwarding the interests of the farmers of this particular part of Canada. We have been condemned and abused for this, and we have been told that we are trying to separate the farmers of this country. We repeat that in our judgment, the day is fast coming when the farmers of the Maritime Provinces will discover that they will be best repaid, if they keep an eye on their own interests, and get together to impress upon the Parliament of Canada the fact that there is such a place as the Maritime Provinces and that we are entitled to the same kind of treatment as the rest of Canada.

A short time ago the Maritime Farmer called for equal treatment for the wheat growers of the Maritime Provinces and for the same "privileges" for Eastern farm produce as for that demanded for the wheat of three middle west provinces. Again we were denounced. We were told that we were wrong in asking for any such concessions for potato growers or for dairy producers. It was all right for the West to get this, but the East could have nothing.

Well, a special raise was given to the price of western wheat, which was advanced fifty cents per bushel, while the wheat of the other proyinces was allowed to stand where it was. Then it was announced that the farmers of Saskatchewan would get $32,000,000 more money for their wheat, in view of the government handling of the wheat situation. Manitoba is to get $20,000,000. Not satisfied with that the Wheat Board has boosted the price of western wheat thirty-five cents per bushel higher. This time Quebec and Ontario wheat goes up forty cents per bushel. New Brunswick, Prince Edward Island and Nova Scotia wheat stays at the old price and not one cent of consideration is given the wheat of Eastern Canada. Why?

Take cheese. The price of this commodity was kept down for the benefit of the consumer of Great Britain. Has anybody in the cheese producing sections of Kings and Westmorland been advised that any such consideration was to be given them, because prices were regulated? It goes without saying that no such thing has been heard of and again the Maritime Farmer repeats that it is about time the farmers down here began to think for themselves, and to act for themselves. Just so long as they are content to be advised and guided by Winnipeg, just so long will they find themselves the smallest pig in the litter.

The Maritime Farmer is not afraid to advocate such a policy. We believe that if there are to be no "special privileges", then this part of Canada is entitled to every consideration. So far we have received nothing but hot air. Our farmers have been told of the wonders that would follow, if only the farmers of the East would line up with the western grain growers.

When may we ask, are all these wonders going to develop. There are on the Canadian Wheat Board three representatives of the Grain Growers. How is it that these gentlemen overlooked the wheat of the Maritime Provinces entirely, when they made their last award. They don't forget the farmer of the Maritime Provinces when they ask for his votes, but when it comes to dollars and cents, they seem to be thinking of other things and other places.

Last week we published the Grain Growers' opinion of western apples. So that no denial could be made, we reproduced a photographed page, in which the "size, color, flavor, keeping qualities, etc." of western apples were enlarged upon, three months after the United Fruit Growers of Nova Scotia, had engaged to pay $6,000 to the Grain Growers Guide for the establishment of a branch of that paper in the Maritime Provinces.

Again the Maritime Farmer called attention to the arbitrary manner in which prospective candidates of the United Farmers, by the platform of the Grain Growers, were made to swallow the whole dose and to be subject to recall, if they did not do the bidding of a committee, appointed to control their thoughts and statements. Again we were all wrong. Well, we have been vindicated in a pretty thorough manner, by no less a person than Premier Drury and eighty per cent. of the farmer representatives of Ontario.

Recently a bill was introduced to provide for superannuation of the civil servants of Ontario. Premier Drury and all but sixteen of his followers agreed to support the measure. Then, in steps Mr. J. J. Morrison, the gentleman who made the trip from Toronto to advise the farmers of Nova Scotia to endorse the eight hour day. Mr. Morrison, as secretary of the United Farmers of Ontario, wrote Premier Drury that he would not stand for the passing of any such legislation. The Premier told Mr. Morrison to "go to." The bill is going through and eighty per cent. of the United Farmer members are standing back of their leader and are against Mr. Morrison, who has been trying to run the most water tight political machine ever devised in Canada. So, if the Maritime Farmer was wrong, we are pleased to be in such good company, and we wish to commend Premier Drury for his firm stand and his refusal to be led by the nose.

Once again is the Maritime Farmer endorsed by such an acceptable supporter as the Farmers Sun, the organ of the United Farmers of Ontario. The Sun is out hot foot against price control. It wants the markets of the country to be thrown open. It is standing just where the Maritime Farmer stands, and has stood and it is against a principle, which is being advocated alone from Winnipeg and the west. Again we find ourselves in good company.

So it would seem that Premier Drury, The Farmers Sun and the Maritime Farmer have conspired to injure farmers, simply because they do not see eye to eye with Winnipeg and its "Big club methods." This support from such unexpected quarters is rather refreshing. It shows that what we predicted is coming true. It offers a double reason why the farmers of the east should get together and stand together for their own good. Premier Drury has defied Mr. J. J. Morrison. The Maritime Farmer and the Farmers Sun have had courage to speak for open markets and to protest against price manipulation. The Grain Growers Guide and its controlled offshoot the United Farmer's Guide are for anything that will help the western grain grower. We want for our people anything that is to be given the west and we think we are right in asking for it.

Not so long ago the editor of the Grain Growers Guide was out blackmailing the manufacturers of this country for revenues, with which to support the policies of the western grain growers. We exposed the trick and condemned it. The campaign ceased as suddenly as it started, (in public), but all over the west, circulars were issued, asking farmers to unite in forcing men who had been denounced as robbers, crooks, etc., to advertise in the Grain Growers Guide and provide funds for the carrying on of the propaganda of the western farmers. We do not know who is responsible for ending Mr. George Chipman's little game, but if it was Hon. T. A. Crerar, this paper wishes to congratulate him on putting an end to one of the most brazen holdups ever attempted in this country.

The Maritime Farmer is doing the farmers of the Maritime Provinces a real service. When the fall months come, and feeds advance to the highest pirces ever heard of in this country, particularly if the Wheat Board is maintained, those farmers who pay the price will appreciate how sound is the stand of this paper against special privileges for the West. Already feeds have gone away out of sight in price. But wait until you see them next year.

The whole scheme is one for the benefit of the West. Every move indicates that. Here in the Maritime Provinces where we have brains and ability to look after our own interests, there should be an awakening of the farmers to an appreciation of the role they are asked to play. We have not asked a farmer how he is to vote, all the free advice is coming from Winnipeg.

The game is one to build up a party to do the bidding of the West. We say that if the West wants the earth, they will get it, if we do not meet the onslaught. It has been said that the farmers have no paper. If the Maritime Farmer had sold itself to Winnipeg, there would not be a paper left to represent those farmers who are opposed to western domination, and judging from the letters the Maritime Farmer is receiving in support of its policy, these number many thousands.

If any considerable number of Maritime Province farmers want a paper to represent a Maritime Province organization, absolutely independent of Winnipeg, the Maritime Farmer will place itself at their disposal. They can then formulate their own policy. They will have a paper which stands for the East and for the farmers of the East. They will have an organ, which is not directed from Winnipeg and one which has served the farmers of Eastern Canada well in the last 25 years.

Denial has been made of the control of the United Farmers Guide from Winnipeg. We have at hand "The Guide Post", published by the Grain Growers Guide, Winnipeg. It fathers, mothers and adopts its Moncton child. Both papers are out for a national policy as narrow as ever the Maritime Farmer termed it.

However, we are glad to note that our views are finding favor in high places. Presently the farmers of the Maritime Provinces will awaken to the true meaning of it all. The thousands of dollars being spent by Winnipeg in this territory, are not being wasted, in the estimation of the spenders. The bread is being cast upon the waters with a view to its return many fold.

The Maritime Farmer has never advised the farmers of eastern Canada except along sane lines. We have made an offer which we are prepared to carry out at any time. It is a pretty good guarantee that we are at least sincere, when we express our opinions. If the Maritime Province farmers want a paper, through which they and not Winnipeg can talk, they can have it, so long as we are assured that it will really be Eastern farmers that are being served.

Endorses Bolshevism and Radicals

United Farmers Guide Praises Article in Favor of Cults Which Would Ignore All Property Rights--When are Farms to be Confiscated

One of the most remarkable articles which to the knowledge of the Maritime Farmer has ever appeared in the press of the Maritime Provinces was published in the May 5th issue of the United Farmers' Guide. Not only was it given prominence but the editorial columns of that paper pronounced a benediction in its opening article as follows:

A short but very pointed article apwhich appears on page 16 entitled, "The Meaning of the Opposition" shows what an intelligent farmer thinks of the attacks on the organized farmers movement on the part of those who have been living at the Farmers' expense for a long time." (Meaning the Maritime Farmer, no doubt.)

The article which appears on page 16 is as follows:

"THE MEANING OF THE OPPOSITION"

The following reply is from the Kings County, N. S., Farmer: "You say that you are unable to understand the reason behind the attack which the 'Maritime Farmer' has made upon the grain growers and the 'Grain Growers' Guide.' "

There might be the question of the competition of the United Farmers' Guide with the Maritime Farmer. It must be well known to you that there are powerful interests in Canada which would like to see the Farmer's Movement fail. It will be a serious mistake on the part of the friends of that movement if they underestimate the strength of these interests and the means which they will employ to bring about the failure of the Farmers' Movement or any like movement. In my opinion you should be prepared for much more serious attacks than you have witnessed in the "Maritime Farmer."

Has it ever occurred to you to what extent the Press in general is under the influence of, or in sympathy with, the moneyed interests of the world? These interests are not going to give up without a struggle and it is my opinion that they number the Farmers' Movement in Canada among their enemies. Note the treatment of the Non-partisan League of North Dakota, the radicals of the United States, and how the Press has misrepresented the Bolshevists of Russia and of Hungary. I do not want to discourage you, but rather forewarn you that you are not engaged in any picnic in your work in connection with the Farmers' Movement. I hope you will always be of good courage and live to see the triumph of your ideals."

So the Guide believes in the Bolshevists and the Radicals of the United States and the Non-partisan league of North Dakota? Well, the Maritime Farmer does not believe in any one of the three and isn't afraid to say so. It will be noted that the writer does not sign his name, but the Guide refers to him as an intelligent farmer. The Maritime Farmer doubts that. Any man who would defend the Radicals of the United States, men who are plotting to upset organized government; men who declare that property ownership should be abolished; men who hindered in every possible way the prosecution of the war by the Allies; men who have stooped to commit every crime in the calendar; is hardly to be regarded as intelligent. Does the United Farmers' Guide approve of radical methods as followed in the United States? Whose votes is it after now with that sort of rot?

And what does the Guide think of the intelligence of a man who endorses the crimes of the Bolshevists. There all property rights have ceased. Apply that lovely form of government to this country and ownership of farms farm machinery and stock disappears. Apply Bolshevism to Canada and the women of this country become common property, as they have in Russia. Apply the methods of the Bolshevists in New Brunswick and law and order ceases and murder and unspeakable crimes rule. The Maritime Farmer is talking whereof it knows. One of the many brilliant sons of Albert County spent months in Russia investigating conditions for the United States Government. His story of the horrors of that country would not indicate that the correspondent of the Guide deserves the praise editorially bestowed on him.

Neither does the Non-partisan league of North Dakota appear to the Maritime Farmer to be anything to hanker after. That cult has imposed on North Dakota taxes undreamed of. The farmers there have had a sickener of the whole show. No more arbitrary form of government has ever been devised by a state in the Union and this is what this intelligent farmer advocates.

Let the Maritime Farmer state as plainly as it can that it is opposed to Bolshevism; that it is opposed to Radicalism, as it is in the United States; that it believes that North Dakota has been cursed with the Non-partisan League and that it also believes that if the United Farmers' Guide believes that men who advocate that sort of thing are displaying intelligence, then the sooner the Guide comes out flat-footed for property confiscation and communism, the sooner will the farmers of this part of Canada learn what is being inflicted on them.

The Maritime Farmer has never opposed organization among farmers. It repeats that the grain growers of the west are spending thousands of dollars down here for their own benefit. We again say to the farmers of the Maritime Provinces: Get together in your own interests. When property confiscation is openly advocated in this way we say the farmers of this part of the country had best look to their rights and their interests.

Not very long ago, one of the leading farmers of the Parish of Salisbury had a visit from one of these "intelligent" persons, on whom the Guide dotes. The farmer listened and then pointing to some rifles which his boys had carried in France, informed the caller that when the day came for the introduction of Radicalism, the guns would be found in action and the boys who had left the farms would be found using them. Which do you admire, Mr. Farmer, that intelligent farmer from Kings County, Nova Scotia, or the New Brunswick farmer who is prepared to stand for British institutions and British love of stability and decency?

Let the Maritime Farmer say squarely that when men write such rot as the Guide chooses to describe as "intelligent" some free tickets should be given them, so that they may go to Russia and taste of the delights of that country. In pity's name, though let their women folk be left under the British flag and in touch with men who respect the most sacred things in womanhood.

We trust we have answered the intelligent farmer of Kings Co., N. S., and that he will understand where this paper stands.

What Quantities of Manure to Apply

The farmer is generally inclined to furnish weak rather than strong doses of mineral manure to his crops. It may therefore seem superfluous to advise him to employ moderation in the use of these fertilizers. However he may be tempted to apply them in large quantities, by way of experiment for instance, and if he does not obtain good returns from the trial, he will be tempted to criticise the fertilizer employed without taking into account the real reason for the failure of his trial.

This is why we think it useful to give some information regarding the maximum quantities of the manure in question that should be employed, and especially when it is considered that it is not only necessary to return to the soil the fertilizing elements which have been taken from it by previous crops, but often also to further fertilize it in advance.

From this fact some may conclude that the farmer need not be afraid of applying the manure in too great quantities. This would be a grave error. Exaggerated amounts of the fertilizer should not be used, and this for several reasons.

1.—What the farmer seeks to obtain is a maximum profit not a maximum crop. It may be interesting to have an extraordinarily abundant crop, but if it is not remunerative, it becomes a simple feat of force and of no practical benefit.

Numerous experiments, wisely directed under the control of distinguished agriculturists, have shown that beyond a certain limit, the effects of manures are no longer proportionate to the quantities employed. In other words, if, at first sight, the products increase proportionately to the quantities of manure furnished to the plant, this proportionality disappears beyond a certain limit. The surplus furnished by a new quantity of manure constantly diminishes until it does not pay for its cost, which, consequently becomes so much money lost.

This is what A. Gouin shows in regard to nutrition. He remarks that if it is useful to indicate to cattle raisers the advantage of giving oil cake to their animals, it is necessary to show them the result of exaggerated doses of these nutritive substances; for the increased production of milk, for example, is not proportionate to the expense incurred, and there is a limit, beyond which this expenditure exceeds the results obtained, and consequently is not advantageous.

It is well knwn that the increase in the speed of ships, which Maritime Companies seek to obtain in order to diminish delays in transportation, and thus to increase their clientele, which demands, more and more, the rapidity of ocean voyages, is only acquired by outlay for coal which materially deviates from following an arithmetical progression.

It is the same thing in agriculture. Much more manure is proportionately necessary to increase a crop of wheat from 35 to 40 bushels than to increase it from 20 to 25.

It is not possible to fix in a precise manure this limit of the maximum of manure which should be used. It is not absolute and connot be determined by figures. It will vary first, evidently, according to the price of the manure and of that of the crops. It will also vary according to the special requirements of each crop and also acording to the richness and nature of the soil cultivated. Experience alone, aided by chemical analysis, can establish the facts.

2.—It is useless again to employ exaggerated quantities of manure, for the reason that although in certain cases the excess which is not utilized by the crop for which it is used, is able to remain buried in the soil, at the disposal of later crops, thus increasing the fertility of the field, this storage of reserve does not always occur. The soil must posses a sufficient absorbing power in order to retain it; that is to say that it must include suitable quantities of clay soil, and limestone. Again, this power in the soil fixing, only acts on certain fertilizing elements such as phosphoric acid and potash. It is nul or nearly so in its effects upon lime and nitrogen especially if this latter mentioned is in the nitric form. Rain waters carry them away and rapidly impoverish the soil. The farmer, who with good intention has used large quantities of manure and who has not obtained correspondingly large increases in his crops, has not then in the majority of cases even the consolation of knowing that the following crops will be able to utilize these surpluses of nutritive elements and thus t oreimburse him for the loss sustained.

3. — Lastly, there are manures which, when applied in too large quantities are not only unremunerative but are actually injurious. Such are the nitrogenous manures. They increase the productions of leaves to the detriment of the value of the crop propertly so called. Wheat, for example, is developed by them in an exaggerated manner. The stalks are thick, the leaves large, the shoots numerous; in a word, the vegetative organs show considerable development. But the growth is abnormal, uneven; the grains are not uniform and their maturity is retarded. The wheat is exposed to heating, to be beaten down, and to the attacks of cryptogamic diseases. There is much of straw but not of grain. The crop is not in proportion to the quantity of nitrogen added to the soil.

It follows therefore from these observations that if farmers are to be advised to use mineral manures, it is necessary to advise them that they should not be employed in an inconsiderate manner. They will never prove beneficial so used, and serious inconvenience will sometimes result. —C. F.

CROP-BOUND HENS

What can be done for a fowl when they become crop bound? J. C.

Knead the crop back and forth with the fingers to loosen up the clogged mass. A couple teaspoonfuls of sweet oil will help to loosen up the clogged crop. Isolate the bird after treatment to find if the condition has improved. If the mass will not go down it is necessary to cut open the crop and remove it. Then sew up the wound and only feed the bird on milk for two or three days. The wound will heal quickly and the operation does not seem to cause the bird severe pain.

N. B. Dept. of Agriculture Standing Field Crops Competitions 1920

Field Crops Competitions were instituted for the purpose of encouraging the growing of good seed and incidentally better crops. Farmers who do not grow a sufficient quantity of seed to supply their individual needs and who do not have a surplus for sale as seed have no right to participate in competitions of this kind.

In years gon by the Federal Seed Division, Ottawa, gave every Provincial Department of Agriculture grants of money for the purpose of conducting competitions in the growing of good seed. The various crops, on which prizes were awarded were judged in the field and many farmers participated in the prize monies.

The Federal Seed Division officials in common with many other persons who have given this matter serious consideration feel that while Standing Field Crops Competitions have been the means of stimulating an active interest the sowing and producing of good seed, the time has arrived when the inspection given in the field must be supplemented by the inspection of the seed in the bin after it has been graded for the seed market. Consequently the Federal Seed Division has decreed that at least twenty-five per cent, of the money to which any province is entitled as a subvention for Field Crops Competitions, must be expended on a competion which will include both field and bin inspection.

For a combined field and bin inspection competition there must be at least fifteen entries and prizes shall be based thirty-five per cent. on the awards of the judges for the Standing Seed Crops and sixty-five per cent. on the awards of the judges for the cleaned seed, the latter to be judged either in the sack or bin on the premises of the competitor on or after December 15th following harvest and before March 1st, 1921. The stock seed must be of origin approved by a committee appointed by the Provincial Minister of Agriculture.

The minimum quantity of cleaned seed that competitors must be prepared to submit to the judges on their premises in order to qualify for awards are:

Oats, 200 bushels.
Clover, 10 bushels.
Potatoes, 150 bushels.

Crops produced solely for purposes other than for seed are not eligible fo participation in any monies granterd for Field Crops Competitions by the Federal Seed Division. Consequently there will not be a Turnip Growing Competition in the Province of New Brunswick this year. There will be competitions in the growing of wheat, oats, clover and potatoes as follows:

Wheat, any named variety, 1 acre. Ten prizes: 1st, $10.00; 2nd, $9.00; 3rd, $8.00; 4th, $7.00; 5th, $6.00; 6th, $5.00; 7th, $4.00; 8th, $3.00; 9th, $2.00; 10th, $1.00 in each county from which fifteen or more entries are received. Judged in the field only.

Oats, any named variety, 5 acres. Ten prizes: 1st, $30.00; 2nd, $27.00; 3rd, $25.00; 4th, $23.00; 5th, $21.00; 6th, $19.00; 7th, 17.00; 8th, $15.00; 9th, $13.00; 10th, $10.00.

This is a combined 35% field and 65% bin inspection competition and is open only to the County of Westmorland, where it is hoped to establish a seed growing centre.

Oats, any named variety, 2 acres. Open to all counties with the exception of Westmorland County. Ten prizes: 1st, $10.00; 2nd, $9.00; 3rd, $8.00; 4th, $7.00; 5th, $6.00; 6th, $5.00; 7th, $4.00; 8th, $3.00; 9th, $2.00; 10th, $1.00.

Judged in the field only.

Potatoes—Green Mountain type or Irish Cobbler type—2 acres of either type. Competition in each of Restigouche, Gloucester, Northumberland and Westmorland Counties, from which 15 entries are received.

Ten Prizes: 1st, $23.00 2nd, $19.00; 3rd, $17.00; 4th, $16.00; 5th, $15.00; 6th, $14.00; 7th, $13.00; 8th, $12.00; 9th, $11.00; 10th, $10.00.

This is a 65% field and 35% bin inspection competition.

Potatoes, Green Mountain type or Irish Cobbler type, 1 acre of either type.

Ten Prizes: 1st, $10.00 2nd, $9.00; 3rd, $8.00; 4th, $7.00; 5th, $6.00; 6th, $5.00; 7th, $4.00; 8th, $3.00; 9th, $2.00; 10th, $1.00. In every county from which 15 entries are received, excepting Restigouche, Gloucester, Northumberland and Westmorland.

Judged in field only.

Clover, 5 acres.

Ten Prizes: 1st, $30.00; 2nd. $27.00; 3rd, $25.00; 4th, $23.00; 5th, $21.00; 6th, $19.00; 7th, $17.00; 8th, $15.00; 9th, $13.00; 10th, $10.00.

This is a province wide competition to be judged in field and bin.

First crop clover will be judged early in August. Second crop in September.

General Rules

(1) The variety must be named and source of seed designated when making entry.

(2) An entry fee of twenty-five cents per crop will be charged.

(3) Entries will not be received for more than one variety of wheat or oats from one farm.

(4) Entries accompanied by the stipulated entry fees must be lodged with the Secretary of the Agricultural Society located in the competitor's district before July 15, 1920.

(5) The Secretary of each Agricultural Society will forward all entries and one-half of fees thus received to the Superintendent of Agricultural Societies, Department of Agriculture, Fredericton, N. B., on or before July 20th, 1920.

(6) Entries not lodged with the Department of Agriculture before July 25th, 1920, and entries not accompanied by the specified entry fee will not be judged.

(7) The minimum number of contestants necessary to constitute a competition in any one crop in a County will be fifteen.

(8) A prize will not be awarded on any crop that does not score 85 points out of a possible 100 points.

For any further information write the Department of Agriculture, Fredericton, or call on your nearest Agricultural Representative: Jas. Bremner, Jr., Chatham; J. H. King, Moncton; J. H. Hoyt, Perth; J. E. McIntyre, Perth.

Pass this information on to your neighbors and help make the 1920 competitions the best ever held in the Province of New Brunswick.

M. A. MacLEOD,
Supt. Agricultural Societies.

Central Principles of Weed Control

At all times weeds are a serious menace to the farming industry. Instances are not uncommon where farms have become so overrun, with them that the owners have moved away. If the exact loss weeds cause to farm crops could be figured accurately in dollars and cents its magnitude would be appalling. This loss goes on year after year. On some farms it is trifling on many others it takes a heavy toll of the crop yield. Weeds are introduced in various ways. One of the most common ways being through threshing machines moving from farms badly infected to clean farms. Many farmers still continue to buy the cheaper grades of clover and grass seed that contain many weed seeds per ounce and thus lay up trouble for themselves at a later date.

Classification of Weeds.—In order to combat weeds successfully, one must have a knowledge of two points, (1) How long the plant lives, (2) How it reproduces and spreads.

Weeds may be classified according to length of life as follows:

Annuals.—These come up from the seed, bear flowers and seeds and die down, all within one year. Example, common mustard.

Biennials.—These grow from the seed, but produce only leaves and a root the first year. The second year a flower stalk comes up, seeds are produced and the plant dies. Example burdock and blue weed.

Perennials.—These live on year after year unless the root is killed in some way. Depending upon conditions, the plant may or may not produce seed every year. Quack grass or Couch grass, and perennial sow thistle are familiar examples.

Weeds may also be classified according to their methods of reproducing and spreading. Plants reproduce in various ways; by seeds alone by roots alone, by both seeds and roots, and by runners and root stocks. The importance of knowing the habit of any weed lies in applying this knowledge to the eradication of the plant. For instance, it would avail little to attempt to destroy perennial sow thistle and Couch grass by preventing it from going to seed because it really spreads more rapidly by the underground stems than it does by seed.

General Methods of Controlling Weeds

There are at least eight well known methods for controlling weeds:

1.—**Crop Rotation.** Each farmer must select the rotation which will best enable him to fight the particular weed or weeds with which he has to contend. In general it can be said that the shorter the rotation the more eeffctive will be the control of the weeds.

2.—**Hoed Crops.** Breaking up land often with the use of hoed crops tends to keep it clean. These crops cannot be depended upon alone, however, to control creeping perennials. This is due to the fact that although in cultivating the rootstocks are cut, they are not all destroyed, and, in a short time, begin to grow again.

3.—**Summer Fallowing.** It is generally conceded that summer fallowing is too wasteful of land to be employed very extensively. It is possibly, the most effective way of controlling the hardy perennials. Where a field is badly infested with sow thistle, it might pay to lose one crop in order to effectively eradicate this weed.

4.—**Early After-Harvest Cultivation.** This is one of the best ways to destroy annual of winter annual weeds.

5.—**Seeding Down.** A heavy seeding of grass and clover will effectively control many annuals. Cutting the hay crop early will prevent most of these seeds from going to seed.

6.—**Smother Crops.** The aim of this method is to kill the weeds by depriving them of light and air. This is accomplished by getting some quick-growing crop, such as buckwheat, established on the land while the weeds are in a weakened condition from recent cultivation. This is a very effective way of controlling many weeds.

7.—**Hand Pulling.** This is practical only when a weed is not very abundant. If a farmer is watching his crops and fields closely he can frequently check the spread of a bad weed by digging it out upon its first appearance. This may save an endless amount of trouble later on.

8.—**Sheep.** It is well known that a flock of sheep will do a great deal toward helping to keep down weeds. In fact, there are few weeds that sheep will not eat. At the present time they are a very profitable class of live stock as well.

Bad Weeds in New Brunswick

1.—**Wild Mustard.** Owing to the great vitality of the seed this is a hard weed to eradicate. The seed will live for years in the ground and when brought to the surface will germinate and grow. If the weed is just starting on the farm and only showing to a small extent hand pulling is the best thing to do. If, however. as is usually the case, the field is overrun with it, the following system is recommended: Cultivate the stubble ground early after harvest. As soon as the seeds have had time to sprout cultivate again thoroughly, repeat this at intervals and plough the last thing in the fall. Put in cultivated crop the following spring and cultivate thoroughly throughout the growing season. Cultivate with the disc or spring-tooth cultivator after the cultivated crop is removed but do not plough in the fall. Cultivate again in the spring and seed down with a grain crop the following year.

Spraying with Chemicals.—Demonstrations have been conducted which have shown that mustard can be prevented from flowering and going to seed by the use of sprays. If these were continued long enough a field would eventually become rid of the weed. Those sprays destroy the mustard but do not injure the grain. Iron sulphate (copperas) 80 pound to 40 gallons of water, may be used. Spray on a bright sunny day when the young mustard plants are well up, but before they come in bloom. Spraying attachments can be secured to go with any barrel pump and the material can be very quickly applied. Copper sulphate (blue stone) can also be used ,eight pounds to 40 gallons of water being a strong enough solution. It has not proved quite as effective as the iron sulphate.

Orange Hawkweed or Devil's Paint Brush.—This weed is readily controlled by cultivation. It gains a foot-

Gleanings of Agricultural Progress in New Brunswick

VALUE OF NEW BRUNSWICK'S FARM CROPS MORE THAN DOUBLED SINCE 1914

Only Two Provinces in Canada Show Larger Per Centage of Gain in Progress in General Farming. Larger Acreage Under Crop in 1919 Than in Nova Scotia

The Business Review and Maritime Retailer recorded with some satisfaction in a recent issue the fact of New Brunswick leading all Canada in the increase of its live stock and it is gratifying to find that this province is also among the leaders in percentage of gain in the value of farm crops during the last four years. Counting the war period, 1914 to 1919 Quebec has made the largest gain, 310 per cent; Nova Scotia comes next with 287 per cent; New Brunswick a god third with 263 per cent; Alberta 250 per cent; Manitoba 248 per cent; British Columbia 210 per cent; Saskatchewan 198 per cent; Prince Edward Island 191 per cent; and Ontario 189 per cent. The figures for field crop values in the provinces for 1914 and 1919 are as follows:—

	1914	1919	p.c. gain
Que.	99,279,000	307,944,000	310
N. S. ...	21,969,700	63,086,000	287
N. B. ...	20,045,100	52,834,000	263
Alta. ...	59,779,600	149,580,800	250
Man. ...	65,528,400	162,462,200	248
B. C.	11,463,000	24,120,000	210
Sask. ..	152,751,500	296,831,800	198
P. E. I. ..	11,544,000	22,067,200	191
Ont. ..	196,220,000	373,507,500	189

Saskatchewan in 1919 had the largest area under crop, 17,430,354 acres; the other provinces being in the following order, Ontaria, 9,915,884; Alberta 8,170,971; Quebec 7,973,021; Manitoba 6,344,318; New Brunswick 1,335,118; Nova Scotia 1,011,144; Prince Edward Island 526,628; British Columbia 340,002.

The prairie provinces produced 165-544,300 bushels out of the total production of 193,260,400 bushels of wheat.

Taking Canada as a whole, the year 1919 holds the record in the value of field crops, the total value being $1,452,437,500. It also holds the record for the amount of land under cultivation, 53,049,640 acres. The value of the crop was $79,501,530 over that for 1918, the increase in the area under crop being 1,622,450 acres. The value of the crops for the last six years is as follows:—

1919	$1,452,437,500
1918	1,372,935,970
1917	1,144,636,450
1916	886,494,900
1915	825,370,600
1914	638,590,300

The acreage under crop during this period has been as follows:—

	Acres
1919	53,049,640
1918	51,427,190
1917	42,602,288
1916	38,930,333
1915	39,140,460
1914	33,436,675

Wheat was the most valuable crop during 1919, being worth $364,857,000; hay and clover second with $338,703,-200; oats third with $317,097,000; potatoes $118,894,200; barley $77,462,-700; flax $22,609,500. The wheat crop was worth $83,000,000 more than in 1918; the oat crop was worth $16,-000,000 less; hay and clover were worth $97,000,000 more.

NOTES REGARDING THE CO-OPERATIVE MARKETING OF WOOL

Work in connection with the distribution of supplies needed in the Co-operative Marketing of Wool is going on very smoothly. Wool, sacks paper twine and shipping tags are being distributed by counties as follows:

Resigouche and Gloucester—J. K. King, 347 St. George St., Moncton.

Northumberland—James Bremner, Jr., Agricultural Representative, Chatham.

Westmorland, Albert, Kent and Kings—J. H. King, Agricultural Representative, Moncton.

St. John, Queen's, Charlotte, York Sunbury, Carleton, Victoria, Madawaska—F. W. Walsh, Asst., Supt. Livestock Division, Department of Agriculture, Fredericton, N. B.

If you have not secured your supplies do so at once. The following instructions are being sent out to those marketing wool in this progressive manner.

Packing and Shipping Instructions

1. Tie each fleece separately, using one paper string, per fleece. If "Wool Tying Box" is used, two strings per fleece are required.

2. When fleece has been tied, pack snugly into a wool sack.

3. Sew wool sack up securely, taking care to place one shipping tag (properly filled out) inside the sack. The second tag should be fastened securely on the outside of sack.

4. Keep wool in a dry place after shearing until it is shipped to Wool Ware House, Fredericton.

5. Wool will be received at the Wool Ware House between May 20th and June 20th, therefore do not ship until after May 18th.

6. The wool is to be sent by freight or express (freight when possible), with all charges collect to the Wool Ware House, Fredericton.

7. In shipping make out the Bill of Lading correctly and write distinctly. Ask the agent to write the full name of the consignor on the freight advices as this saves considerable trouble at this end.

8. As soon as wool is shipped, write to F. W. Walsh, Livestock Division, Department of Agriculture, Fredericton, enclosing the Original (No. 1) Bill of Lading.

Follow the above instructions closely and in filling in shipping tags write distinctly.

Warehouse

The New Brunswick Wool Growers have been very fortunate in securing the use of an up-to-date warehouse in the Exhibition Building, Fredericton. This building has a splendid concrete floor which prevents any drying out of the wool in the process of grading and at the same time the building is supplied with plenty of windows.

Prospects

From all indications 1920 will be a banner year for the Co-operative Marketing of Wool in New Brunswick. It is expected that over 100,-000 lbs. will be handled. Last year, 55,840 lbs. were handled.

Canadian Co-operative Wool Growers

All wool is shipped to the Wool Warehouse, Fredericton, to be marketed co-operatively and sold to the manufacturers by the Canadian Co-operative Wool Growers, Ltd. This company is made up of sheep-raisers from all provinces of the Dominion, and A. E. Trites, of Salisbury, is the Director for New Brunswick. This Company handles the bulk of the Canadian Wool Clip. Last year over 4,000,000 lbs. were sold through them. This year they are planning on a still larger amount of business. Recently they secured the services of Professor Tisdale, who has been connected with the Animal Husbandry Department of the University of Saskatchewan, Saskatoon, and has proved his ability in sheep husbandry. Professor Tisdale thoroughly understands the problems of the sheep industry in Canada and will be most invaluable in the future development of sheep and wool work in the Country. He plans on visiting all the wool associations this summer and expects to be in New Brunswick shortly.

Mr. W. W. Thompson formerly Director of the Co-operative Organization work, of the Saskatchewan Department of Agriculture, Regina, has also joined the staff of this company.

Notes From the Nova Scotia Agricultural College

Gleanings from Institute Reports

The Spring report of the Institutes show an active interest in gardening; the care and raising of poultry; School Gardens and School Improvement campaigns. A clean-up day is a feature of Institute work in some localities, and it grows in popularity and importance each year. It is most inspiring to read the reports which come in steadily from the Institutes. The members work hard with no thought of reward or spectacular glory, but the sum total of their work throughout the Province show that the ideal of "Home and Country" is well worth the effort expended.

We welcome two new Institutes in Kings County. One at Medford and the other at Cambridge. We are quite sure that these new Institutes will be splendid aids to our work.

A number of the Institutes are small in number, their members busy housewives who have to drive some distance to the meetings. When these handicaps are considered, one wonders how they accomplish so much, but as is often the case, it is the busy woman who can find time to do a little more.

Detailed reports of the Institutes as gathered from their reports follows:—

Arcadia is still interested in their school and recently sanitary towels were supplied to the school by the Institute. A Pie Social held brought them the sum of $17.30, and the young people of the place held a St. Patrick's Party and handed over the sum of $11.50 to the Institute.

Bridgetown Institute is sewing and caring for needy children in their town.

Bridgewater is interested in Social Service. Their April meeting included the report of the delegate who had attended the Social Service meeting in Halifax. The Roll Call at the last meeting was responded to by quotations on "Friendship." A resolution was passed that the Institute do all the hemming of sheets and pillow cases for the new Dawson Memorial Hospital.

Bible Hill Institute is interested in Community Improvement. A Special Committee appointed for this work decided to confine their energies to the School Grounds, this year, May 5th was set as Arbor Day, and all the people in the Community were invited to the School Grounds to assist in the work. Men and women and boys and girls were present and all interested. Several teams worked all day hauling gravel to make a new roadway. Several donations of trees and shrubs were gratefully received. Mr. Allen of the Horticultural Department of the College has the work in hand and has given much time and assistance to the Institute. They hope to make the grounds an example as a model rural School Ground. A committee of ladies served refreshments during the afternoon, which were greatly apperciated. The W. I. on Bible Hill looks forward to great progress in the future.

Brookfield is preparing for its School Exhibition which is held in the Autumn.

Bear River is interested in the sanitary condition of the school. Also the need of fire escapes in the school building was brought forward by the Institute.

Gaspereaux, one of our new Institutes, is growing. School and community improvement are being undertaken by them.

Caledonia also is interested in School and Community Improvement "In Times Like These," by Mrs. Nellie McLung, is being read and discussed at their meetings.

Halfway River Institute is interested in helping the needy in their district.

Lakeville Institute is reviving after a trying winter of meetings interrupted by storms and sickness. They have taken as their objective the care of an unfortunate child in their locality.

Lawrencetown always has a fine School Exhibition under the auspices of the Institute. Members of the Institute give instruction and assistance to the pupils in sewing, cooking and canning. A Short Course in Cookery is planned for the summer. They are also interested in starting a Supervised Playground this summer.

East Leicester Institute visited the school and at the close of their visit treated the pupils with delicious maple cream. No doubt their visit was greatly appreciated.

Oxford Institute has been busy caring for families who were left destitute by a bad fire in their town. Money, clothing, bedding and furniture was collected and given to the sufferers. They report, with pleasure, that these families are now comfortably situated and grateful to the Women's Institute for its timely assistance. The Institute there does so much to help others; and it has become an important factor in the community.

Port Williams has had a most instructive talk by an expert on "Care of the Teeth.' Grand Pre also had the same talk and derived much benelt from it. Both of these Institutes are greatly interested in Social Service work.

Point Edward, one of our new Institutes is making plans to improve the school house by painting and putting in a new foundation to the building.

Paradise is interested in School and Community Improvement. A pump with fittings has been recently installed in the school by the Institute. They are now taking over the care of the cemetery. The memorial to their boys is to take the

form of entrance gates to the cemetery.

South Side—Middle Stewiacke—has recently held a supper and sale and has raised the sum of $142.00 for the Institute Funds.

Weymouth plans to give comfort and cheer to the inmates of the Digby County Poor House.

Wentworth, a new Institute, has School Improvements as its first consideration.

Crop Outlook for 1920

By the time this issue of the Maritime Farmer reaches the readers, most farmers will be well along with their seeding in these Provinces, and plans will be about complete for all crops. There will still be opportunity, however, for some modifications, and, possibly slight increases in seeded areas, which in the aggregate, will make a considerable difference in next winter's feed supply.

In a recent interview, the Secretary for Agriculture gave a summary of the crop outlook, which is, to say the least, disappointing. The great need of the world today is a full grain crop. He stated, however, that our own West is reporting that the seeded area there will this year be at least 25 per cent. less than last year, owing largely to the unusually late season and the scarcity of labor.

Reports from Australia are to the effect that that country, instead of exporting wheat this year, is not likely to have sufficient for her own needs. In other parts of the wheat growing world, conditions are still uncertain. It is the general opinion among those best qualified to know, that, unless the season is extremely favourable, there will again be a world shortage in oats, wheat and other cereals.

An extra acre sown to grain, or to a silage crop, would seem to be a wise precaution for every farmer who sees his way clear to handle it. No one can tell what the Canadian harvest may be as yet, but with the granaries of the world still bare, the prospect is that mill feeds of all kinds will still remain scarce and high priced.

Short Course in Home Economics

Announcement is hereby made to the readers of the Maritime Farmer that a Short Course in Home Economics wiil be given at the Nova Scotia College of Agriculture, beginning early in July. The course will be open to Nova Scotia girls between the ages of 12 and 18. Classes will be held daily in the science building tuition being free. Special attention will be given to food values, canning and cookery.

The arrangements are that the girls will room in the neighborhood and will prepare and serve their own meals at the College, as a part of their practical instruction. In this way it is hoped that the cost per week will not exceed $6.00, the regular boarding rate in Truro at present being from $9 to $10. The girls will be under the care of competent instructors throughout their stay in Truro.

The first period will run from July 6th to 16th. If the first period is patronized well, a second will be arranged for, to run from July 20th to 30th. For full information write to Miss Helen Macdougall, (Superintendent of Women's Institutes for Nova Scotia), Agricultural College, Truro, N. S.

THE ROOSTER

Now, unless he is a show bird, off with his head! The poultry business will only reach its own when each detail is attended to. There is probably less room for sentiment in it than most lines. To the farmers the temptation is to regard it as a small matter, and let it drift. But the male bird should not run with the flock, especially in the warm season. Fertile eggs are not fit for summer marketing. So, off with his head!

CHEAPER BUG POISON

Among poisons for the control of biting insects, such as the potato bug Paris Green has been first both in point of time and in popularity. It is now an expensive article, and the farmers are reminded that they are paying the greater part of the price for the green colour, which is of no importance so far as the killing of bugs is concerned. The green tint is due to the large crystals of arsenic when combined with a copper base. The standard metallic bases are copper, lead, zinc and lime. Of these copper has advanced greatly in price during the war, and is now nearly in the class of precious metals. The cheapest of the lot is, of course, lime.

When arsenic is combined with lime one resulting compound is arsenate of lime. The appearance of this compound is that of a very fine white powder, and the price is about one third that of Paris Green. Its killing properties, per content of arsenic, exceed those of the latter, as it contains the same poison in a much finer condition so that it remains longer in suspension, thus reguiring less stirring, and for the same reason adhering much better to the foiliage.

Arsenate of lime is suitable for use alone, or compounded with Bordeaux mixture, on all vegetable crops including potatoes. For fruit trees 5 pounds of water slaked lime should be added to one pound of arsenate.

A tremendous business has sprung up within the past three years in this cheaper poison, partly owing to its effectiveness in controlling the boll weevil, the most serious foe to the cotton crop in the South. It is easily available, and should be on sale at all points. Ask for arsenate of lime and save more than half your outlay for poisons. Mention it to your dealer right away so that he may have an adequate supply on hand when needed.

Growing Potatoes for Larger Yields

Importance of Early Planting—Harrow After Potatoes are Planted

By W. T. Macoun, Dominion Horticulturist in Canadian Countryman

The yield per acre of potatoes for the province of Ontario for the year 1919 was 96 bushels, which is 18 bushels below the average for the past thirty-seven years, which is 114 bushels. In good years it is not unusual for individual Canadian farmers to grow 300, 400, and even 500 bushels per acre. The boys in the Carleton and Russell Counties Boys' Potato Competition have grown potatoes on one-tenth acre over 600 bushels per acre. In an irrigated district of Colorado, 847 bushels per acre were grown, and in the irrigated districts of Canada crops nearly as large have been grown. In the Woman's Potato Competition, conducted by the Rural New Yorker over thirty years ago, two women of New York State grew potatoes on a twenty-acre plot at the rate of 1,000 bushels per acre, one producing 1,061 bushels per acre.

What is possible in New York State could be accomplished in Canada. There is a wide range between 96 bushels per acre, the crop for Ontario last year, and 1,000 bushels per acre produced b ythe women of New York State, which shows the great possibilities in this important food crop. There are a number of important factors in the production of a crop of potatoes, some of the most important being: 1, seed; 2, planting; 3, moisture; 4, insects and diseases; and there are others.

The importance of good seed was first strongly impressed upon the writer in 1905, when on a visit to England, an experiment was seen where the results from seed potatoes from the South of England were compared with those from seed potatoes of the same variety from Scotland. At the time the plots were seen, in the middle of summer, the plants from the seed from Scotland were much more vigorous than those from the South of England, and the latter looked as if they would dry up before long. Since that time many experiments have been conducted at the Central Experimental Farm, Ottawa, the results of which have been published in the Annual Reports and elsewhere. These experiments showed that there was an extraordinary difference in yield between idfferent seed stocks, some seen producing almost nothing. It is still a matter of investigation as to how much of this lack of production is due to some obscure disease and how much due to climatic conditions, but the fact remains that there are these great differences in yield, hence, those who desire a good crop, as most do who plant potatoes, should be careful to use seed that is likely to produce a good crop if other conditions are favorable. In 1919, at the Experimental Farm, Ottawa, one lot of Irish Cobbler seed yielded at the rate of 378 bushels per acre, and another at the rate of 37 bushels per acre, a difference of 341 bushels. The best Green Mountain yielded at the rate of 330 bushels per acre, and one of the poorest 46 bushels per acre, a difference of 284 bushels per acre.

There are many potato fields in Ontario where the tops dry up during the month of August, and where the tubers lie in the hot soil until digging time in October. The potatoes from such fields do not make the best seed, and often seed from such fields gives very poor results indeed. On the other hand, there are many fields in certain parts of the province and in other provinces where the tops remain green until killed by frost. It is from such fields that the best seed potatoes come, providing they are free from disease, and usually such fields are the freest from disease.

In the cooler parts of the provinces of Ontario and Quebec, and in the Maritime Provinces, on the Prairies, and in certain parts of British Columbia, these relatively cool conditions prevail in most seasons, hence such places are likely to furnish the best seed one year with another.

The price of potatoes is very high this spring, and, no doubt, many small potatoes will be used for seed. If the small potatoes come from a good crop the previous year, they are likely to produce a good crop this year if the season is favorable, but if they come from a field where the tops dried up in the middle of summer the results are very doubtful and are liable to be poor.

Crops of potatoes can be grown from potato peelings, potato sprouts, and eyes which are gouged out of the potatoes with but a small amount of flesh attached, but the smaller the amount of flesh the smaller the crop is likely to be. If potato plants have not good tops they are not likely to have many tubers, and plants started from such sets as has been just mentioned are not likely to become very strong before hot weather sets in, although in years when the weather is cool and moist it is surprising what a fair crop can be grown from such poor sets. This year, when the potatoes are so very dear, it might pay those who grow but a small quantity to start plants from sprouts, eyes or peeling, planted shallow and close together, in a bed near the house, and after the plants have become well rooted to plant them out just like tomato plants. By starting them in this way one would be sure to have a good stand, as a certain proportion would not grow if they were planted in the ordinary way at first and the ground would be lost. While the use of such sets is not recommended, there are many people who cannot afford to pay the high price for seed and who might get some returns with very little expenditure. It has been found by care ful experiment that the most economical kind of a set in most places in Canada is one weighing from one one one-half to two ounces and having at least two eyes, and even in this year of high priced seed such sets are likely to prove the cheapest in the end.

It is important to plant potatoes soon after cutting them. Every day that they remain unplanted after cutting is liable to lessen the yield. Where large quantities are to be planted, and where it seems necessary to cut seed several days before planting, the sets should be coated with land plaster, gypsum or lime. This prevents the withering of the set to some extent, and greater yields have been obtained where this methods was followed.

Potatoes are planted much too late in some places in Canada, particularly in Ontario. One of the reasons for this is that one can usually get a fair crop of potatoes even when planted early in June, and farmers will plant their other crops before their potatoes. Experiments at Ottawa have shown that better yields are obatined of both early and late varieties by planting before May 15 than after May 15. In 1919 the spring was bery backward and cold, but a planting on May 17 gave higher yields than at any later date. In 1918 Irish Cobbler planted May 14 yielded at the rate of 431 bushels per acre; May 27, 363 bushels; June 10, 330 bushels, and June 24, 94 bushels. The Green Mountain planted on May 14 yielded at the rate of 473 bushels per acre; May 27, 402 bushels per acre; June 10, 321 bushels per acre; and June 24, 70 bushels per acre.

From the experience at Ottawa and the other experimental farms in different parts of Canada, the following advice in regar dto time of planting may be safely given. Where the spring is early and autumn frosts early, plant early. Where the spring and summers are dry, plant early. Where the spirng is late and autumn frosts are early, plant as soon as the soil is dry enough. Where the spring is late and autumn frosts do not come until late, early planting is not so important as potatoes have a long time to grow in the autumn, when a great development of tubers takes places in the cooler weather.

The varieties recommended for different parts of Canada are: for the Maritime Provinces, Irish Cobbler and Green Mountain, with the addition of

MAY 25, 1920

A QUARTER CENTURY OF SERVICE

Nearly twenty-five years have elapsed since the Maritime Farmer first made its appearance in the field of Agricultural journalism. The quarter century mark will be reached when, on September 28th of this year, volume 25, No. 26 goes forth from our presses to the farm homes of the Maritime Provinces and Newfoundland, to which for so long a time it has been a welcome visitor twice each month until the first of January of this year, when it visits became more frequent, owing to the fact that it is now published once in every two weeks, making twenty-six numbers instead of twenty-four numbers in the year.

The aim of the publishers of the Maritime Farmer has been and is to give its readers timely information and suggestions on agricultural topics applicable to Maritime Province conditions and of general interest to farmers in Maritime Canada.

The Maritime Farmer has never dictated to any man or group of men how he or they should exercise their franchise. The Maritime Farmer believes that each and every man and woman have a perfect right to exercise their franchise as seems best to them. Its manager and editors have their own personal views on the various questions that concern the public and have always lived up to the standard that principle comes before party.

Any statements that have appeared or may appear in the editorial columns of The Maritime Farmer are the opinions of the editors of this paper. Neither they nor the Maritime Farmer have ever been approached by any man or party with a view to in any way change its editorial policy. The Maritime Farmer's editorial policy is its own. This has been its guiding star in the past and by this same principle it will be guided in the future.

For twenty-five years The Maritime Farmer has assisted the live stock breeders of Maritime Canada to dispose of their surplus stock. The prize winnings at the various exhibitions have been faithfully reported and mention made of the various breeders on the merits of their stock, no matter whether they were advertisers in the columns of The Maritime Farmer or not. Thousands of dollars worth of live stock has been sold by some of the breeders who were advertisers in our columns from the publicity received through The Maritime Farmer's reports of their winnings. The more progressive breeders ,however, carried on an advertising campaign, and hundreds of letters commending the efficiency of The Maritime Farmer's advertising columns have been received at the office of publication. The Maritime Farmer has always been pleased to assist the farmers of the Maritime Provinces in any legitimate way, feeling that thus its mission was being accomplished.

The Maritime Farmer has never attempted to vilify the United Farmer movement. Long before the official organ of that organization came into existence the Maritime Farmer repeatedly advised farmers to organize and have more of a say in the governments of our country.

Following is an extract from our issue of September 9. 1919:

"At a recent convention of the United Farmers of New Brunswick resident in Carleton and Victoria Counties, T. W. Caldwell, of Florenceville, was selected to carry the Farmers banner at the next Federal election for the Carleton-Victoria riding.

"Mr. Caldwll is the President of the United Farmers of New Brunswick, a public spirited farmer of good repute, appearance and address—the type of man any body of men should be proud to support and the kind of man the Maritime Farmer would like to see elected in every farming constituency in the Maritime Provinces.

"The Maritime Farmer is not a political paper character but we would like to see a clean, intelligent farmer nominated and elected by each and every electoral district in Canada, where farming is the main and most prominent industry. Too long have constituencies of this kind been represented by devotees of some other calling.

"The farmers of Canada are coming into their own. They are fast learning to realize the magnitude and importance of their profession. Too long, it could be truthfully said 'farmers will not stick together.' We trust that when a farmer candidate is in the field in future elections no matter what his political creed may be that it will be said when the votes are counted and the results published, 'the farmers stuck together and elected their man.' "

The Maritime Farmer's opinion of Mr. Caldwell and the movement he has the honor to represent are just the same today as they were in September but it will oppose any evidences of detrimental inteference by western big interests in the affairs of the Maritime Provinces. This stand The Maritime Farmer has taken; it believes in the best interests of the Maritime Province farmers and this stand it will continue to maintain just as long as there is any necessity for such a stand. Let us say again that it is not the business of The Maritime Farmer how any man in the Maritime Provinces should vote, neither is it the business of any journal controlled in Winnipeg.

NO OUTSIDE INFLUENCE CAN DOMINATE THE MARITIME FARMER

The United Farmers' Guide seems to be very worried over the fact that the New Brunswick Department of Agriculture has seen fit, in response to the suggestions of numerous farmers and in concurrence with the unanimous sanction of the greater number of the Agricultural Societies of the province to make use of the columns of the Maritime Farmer.

The necessity for an organ like The Maritime Farmer to carry the activities of the Department and the suggestions of its men to the farmers of New Brunswick became very apparent in war times, when every Department of Agriculture in Canada was asked by the officials who had charge of the food supplies for our soldiers, to get in touch with the producers of food and encourage them in every possible way so that our cause might not fail for lack of supplies.

The various Departments of Agriculture did their utmost to get in touch with the producers and the producers were pleased to keep in close touch with the nation's requirements and provide therefor. In order to get and keep in touch with the producing public, the New Brunswick Minister of Agriculture asked for and received the co-operation of the Agricultural Societies in the Province.

Many of these Societies were not in the habit of holding monthly meetings, and consequently the nation's call to her second line of defence, on the farmers, did not so effectively reach the people until as an emergency measure the majority of them decided on the suggestion of th Department of Agriculture, to hold monthly meetings. So effective has the system of monthly meetings proved that the majority of the Societies have made monthly meetings a permanent feature of their organization.

As it is almost impossible for Secretaries of Agricultural Societies located in sparsely settled districts to keep in touch with the rank and file of the members between meetings, many requests reached the Department of Agriculture for a medium whereby the members of Agricultural Societies would be kept in closer touch with the workings of the Department. After receiving the sanction of the various Agricultural Societies, The Maritime Farmer was adopted as the most suitable medium. The Maritime Farmer is fulfilling its mission.

Its editorial policy is absolutely its own. It is not dictated to by any government or organization, and what is more, it will not brook dictation from any source that might attempt to warp its policy. Any attempt to warp the Maritime Farmer's stand for the east should it come from any government, manufacturer or organization will be just as fully resented and as quickly exposed as was the meddling of the Western big interests in the affiairs of the Maritime Provinces.

The Maritime Farmer believes the farmers of the Maritime Provinces are well advised to organize but in so doing they are perfectly capable of looking after their own interests. We were somewhat amused not long ago to hear two western men remark that in a couple of years the farmers of New Brunswick would be able to conduct their meetings without very much assistance from western talent. We heard these gentlemen speak at several meetings and from our point of view some of our New Brunswick men outdistanced them in every way as executive men and as platform speakers.

Let us say in closing to the United Farmers' Guide that the requests to make the Maritime Farmer the official organ of the New Brunswick Department of Agriculture reached the Department many months before the United Farmers' Guide was mooted.

The exposure in these columns of the hoax that western big interests are attempting to put across in the Maritime Provinces is not institu-

ted by any government, political party or clique. The Maritime Farmer is prepared to stand behind any assertions it has made.

The Grain Growers Guide tried to buy the Maritime Farmer but their offer was refused, as the Maritime Farmer was not for sale. The management of the Maritime Farmer is proud of the stand this organ has taken in what it believes is a stand for the best interests of the Maritime Provinces.

OBJECTS AND WORK OF THE DEMONSTRATION ORCHARDS IN NEW BRUNSWICK

(By G. A. Turney Provincial Horticulturist)

Demonstration orchard work in this Province was first undertaken in 1911, when the Department arranged for the operation for a three year period of parts of the orchards belonging to Joseph Hawkins, Douglas, York County, J. W. Clark, Maugerville, Sunbury County and H. L. Steeves, Lower Coverdale, Albert County. Other orchards taken for similar operation were those of C. R. McKenzie, Lingley, Kings County, in 1912, University of St. Joseph's College, Westmorland County in 1913, O. F. Corey, Havelock, Kings County, and J. R. Randall, Randall's Corner, Sunbury County, in 1914, and William Cobourn Keswick Ridge, York County, in 1916.

Descriptions of these orchards, records of the work done in them and the results obtained were published in my Annual Reports for the years of their operation and are available to interested parties. The operation of these demonstration orchards gave us some much needed data as to costs of production and yields and profits per acre and proved of distinct value in demonstrating the province's possibilities in commercial apple growing and in encouraging new plantings on a larger scale. Their object accomplished we have, for the time being, discontinued that type of demonstration orchard in favor of types of orchards planted by ourselves with the object of ascertaining the most economical methods of growin varieties of proved adaptability and commercial worth in this province.

The work of the old style or bearing demonstration orchards established clearly that our leading varieties of apples those on which the immediate or first extension of the industry would have to be based, are Wealthy, Alexander, Fameuse and the McIntosh (with McIntosh preferred to Fameuse), with a smaller place alloted to Duchess and Dudley and to some winter varieties that may be profitably grown in particular sections. Given, therefore, these four varieties of proved worth and adaptability, the obvious thing to do is to exploit their produnction in the very best sense of the word—to demonstrate as widely as possible their superiority over other varieties for our conditions, and to ascertain and demonstrate the best and most economical emthods of producing them.

In 1918 we established nine new test or demonstration orchards, each consisting of about an equal number of Fameuse, McIntosh and Alexander, planted thirty feet apart each way, the object being to ascertain more concerning the comparative behavior and worth of Fameuse and McIntosh in different sections and the Alexander being included for its pollenizing value. Three of these orchards were established in Queens County, two in Kings County and one each in the Counties of Carleton, Sunbury, York and Westmorland.

In the spring of 1919, seven more and larger orchards of these varieties including Wealthy, in various combinations and planting distances, were set out and are as follows:

Three orchards, each consisting of 50 Wealthy and 50 Dudley, planted fifteen feet apart with a thirty foot roadway separating the block of Dudley from the Wealthy. One orchard consisting of 68 Dudley and 80 Wealthy, planted 12½ feet apart with a thirty foot roadway separating the blocks. One orchard consisting of 75 Dudley and 75 Wealthy, planted 10 feet apart. Two orchards, each consisting of 108 trees per acre—standard trees planted forty feet apart square with one in the centre of each square, giving 39 standard McIntosh and 15 standard Alexander, with fillers twenty feet apart each way, 27 Wealthy and 27 McIntosh.

The object of the Dudley and Wealthy orcharde is to find out if the most economical way of growing these shorter lived and smaller tree varieties is not by closer planting in separate blocks rather than at wider distances among larger growing or standard trees such as McIntosh and Alexander, and, at the same time, to compare the Dudley with the Wealthy in this respect.

These new commercial demonstration orchards, as they will be known, have been placed with leading growers so that the conditions of care and culture are the best obtainable. Accurated and detailed records of the cost of growing, yields, etc., will be kept and published ,and these orchards will be pruned and their care supervised by the Horticultural Division.

INFLUENCE OF TRANSPORTATION ON AGRICULTURAL PRODUCTS

After condition of soil and of climate, freight and express rates and the cost of the care and management of agricultural products are the most important factors to be considered before deciding on the kind of crops to be grown.

In regard to the quest of transport the following principles may be laid down:

1. Products which are easily transported and which do not deteriorate too much by cartage, such for instance as cereals, may easily be profitably produced at a distance from the large centres of population.

2. Perishable products or those which are valuable only in large volume and consequently costly to transport, such as table vegetables, small fruits, potatoes, hay, etc., can be more profitably grown within easy distance of where they are to be consumed.

3. Each group should be disposed of in such manner as to produce the most profit or the least loss without regard to the cost of production.

The most common theory in regard to grain and hay is that these crops when they can be easily and cheaply produced, should always be consumed by animals on the farm. This is an error caused perhaps by the absurd practice by certain institutions of charging their food to the animals at its cost price instead of at the market price as it ought to be. For instance the cost of production of a ton of hay is $5.00 in giving it to cattle to eat. I can obtain it for $8.00 while the market price is $15.00. It is then evident that I should sell my hay rather than consume it on the farm.

These three principles being established, let us now apply them.

How does transport affect the production of pork?

It requires on the average from 5 to 6 pounds of grain to produce a pound of pork, so that 500 pounds of grain converted into pork costs but little more to transport than 100 pounds of natural grain. From this we conclude:

1. That at a distance from large centres of consumption where grain is easily and cheaply produced, it is often advantageous to convert it into pork for shipment. This is practically the chief reason why the maize region of the central States is at the same time the most important cattle raising centre of the world.

2. A region which does not produce all its own grain is, in theory, unable to compete successfully for the economical and paying production of pork with a region which has grain to export. So, in theory, the Province of Quebec is in an inferior position to the Provinces of the West for the cheap production of pork. What makes the raising of pork more or less lucrative in practice in this Province is that:

1. The demand exceed the supply because of the large export trade of several years past.

2. The dairy industry, so favorable to an economical production of pork, is practically non-existent in the Western Provinces, while in the Province of Quebec it is the basis of the hog industry.

The bacon hog, which requires less grain, but more vegetables and by-products of the dairy, should be more appropriate to our Province than the fat pork hog.—C. F.

HOW TO CALCULATE THE RATE OF THE DEPRECIATION OF CATTLE

1. OF CATTLE.

Two causes contribute to depreciate the value of a herd of milch cows; accidental mortality and the progressive diminution of productivity caused by age.

United States statistics have established that about 12 cows out of 1,000 die from illness caused by accidents. On the other many experiences have shown that about 7 years is the average term of productivity of milch cows. Taking these two causes together it is estimated that the annual rate of depreciation of a herd of adult cows is about 14% or 1/7 of the value of the herd. However, there is another thing to be considered; namely that a cow, outside of her value as a machine for the production of milk has her flesh and her skin, the value of which remains all the time, although it is diminished by age. It is easy to understand that this beef value has a more or less marked influence on the annual rate of depreciation. The nearer the price of the cow is to the value of the animal in meat, the less marked is the rate of depreciation.

It is an error then, from the financial point of view, to buy a milch cow of 7 or 8 years of age at the same price that one would pay if she was only 4 or 5 years old. The risks of accidental death are increased and, besides, her productivity is on the decline. One who is not a connoisseur runs generally less risk in buying a large cow, because in case of accident or if this cow is not a good milker, the net loss will be smaller.

2. OF HORSES.

The average duration of a horse is about 14 years. It reaches its maximum of value and of capacity about the age of 5 years; it maintains its vigor until the age of 8 or 10 years, after which it declines. Thus the rate of depreciation of horses after 5 years of age will be about 10%. The same conclusion can then be drawn as in the case of milch cattle.

3. OF SHEEP.

The sheep has a short life and this is why the rate of depreciation is so high. It is never less than 10% and this comes very high on expensive sheep. This rate of depreciation is alone due to a considerable extent to the fact that theer are more deaths and accidents among sheep than among other animals.

4. OF POULTRY.

A flock of common fowls which has been kept 3 years without being renewed may lose about 15% of its value every year. This loss is due to the following facts:

1. The very high death rate: 10 to 12%;

2. The flesh of an old fowl does not sell for as good a price as that of a pullet.

This rate of depreciation may be as high as 24 and even 30% in the case of fowls of pure breed, the incubation or the purchase of which has been costly.

CONCLUSION.—Generally speaking it is better to sell common fowls for their flesh atfer they have been utilized for one year and to replace them by pullets. The difference between the price of sale of the fowls and the price of purchase of the pullet will be amply compensated by the surplus of eggs which the last mentioned will produce in one year.

On the contrary, if one has pure bred fowls purchased at a high price when they were pullets, it is better to keep them 2 or 3 fears, because if they are sold for meat, after having been utilized for one year, to replace them by other pullets, also costing a high price, the difference between the price of purchase and that of sale, which may be very great in such a case, is to the detriment of the poultry raiser, and will not be compensated for by the surplus of eggs yiven by the flock.

LIVE STOCK NOTES

The Federal Department of Ariculture has arranged for the exhibtion in several sountries of Europe of the pure bred Shorthorn steer, "Roan Jasper," champion steer of the Guelph Winter Fair of 1919, and of the grade Angus steer, "Black Hector," champion steer at the Toronto Fat Stock Show of 1919. These animals are the property of H. P. Kennedy & Copany, Toronto, who purchased them at the Toronto sale. Mr. Kennedy is directly interested in the export trade in Canadian cattle and has co-operated with the Department of Agriculture in this special advertising scheme by donating these two high class animals and by landing them at Antwerp with a large shipment sent over by him during the present months.

"Roan Jasper" was bred and exhibited by J. M. Gardhouse, of Weston, and in addition to winning at the Guelph Winter Fair, he was the grand champion steer at the Canadian National Exhibition in September of last year. When shown in Guelph in December at 15 months of age, this steer weighed 1,110 pounds. "Black Hector" was bred by A. & G. Whitlaw at Guelph and when shown in December at the age of 20 months weighed, 1,290 pounds.

On arrival at Antwerp these steers will be taken in charge by a representative of the Federal Department of Agriculture, acting under the general direction of the Honorable Rudolf Roy, Commissioner for Canada in France, who is in charge of arrangements for exhibiting them at some of the larger centres in France, Belgium and possibly Switzerland. The tour will continue for several weeks and when it is concluded the cattle will be sold and the proceeds will be contributed to charitable purposes.

The purpose of this somewhat unique undertaking is to make known to those in the cattle trade in the countries visited, the ability of the Canadian Live Stock Industry to supply export finished cattle or bullocks of the desred type and quality for feeding purposes.

During the year ended December 31st, 1919, the cash sales of hogs marketed at six Canadian Stock Yards reached a total exceeding $26,000,000. This amount of money does not include the value of hogs shipped direct to packing plants and passing through the yards. It is estimated that the cash value of the hogs sold off the farm during 1919 exceeded $80,000,000.

The average weight of the hogs marketed at the Union Stock Yards, Toronto, during 1919 was 187 pounds.

Approximately 2,332,400 hogs were slaughtered at Inspected Establishments during 1919, compared with approximately 2,260,700 hogs during the previous year, an increas of about 72,000 head in 1919. Ontarib and Quebec supplied the surplus, the Western Provinces running short of the 1918 total.—Live Stock Commissioner.

HORTICULTURE.

METHOD OF ORCHARD CULTIVATION

(Experimental Farms Note)

The method or system of cultivation to be adopted may be varied to some extent to meet local conditions. In reality, however, all systems should be, and in most cases are, a slight modification of the "clean cultivation and cover crop system."

THE CLEAN CULTIVATION METHOD, calls for all the ground under and around the trees to be ploughed and frequently harrowed until around July first.

This system has much to recommend it, viz. (1) maximum conservation of soil moisture; (2) excellent conditions for liberation of plant food especially nitrogen; (3) sightliness and cleanliness of the orchard and (4) control of insect pests.

In connection with this, either fall or spring ploughing may be practised, the former however, only in those localities with a favourable enough winter to so permit. The great secret o fsuccess with any system of cultivatio ndesigned to conserve moisture and liberate plant food is to get on the land as early in spring as possible, otherwise, if the orchard is not ploughed until late, most of the advantages of cultivation are lost.

Modifications of the above consist of leaving a strip of sod about four feet in width next to the trees. In old orchards where it is difficult to get close to the trees this may be practised successfully, in which case the grass is cut once or twice during the season and allowed to remain as a mulch.

In both these instances, on the cultivated portion a mulch is maintained until about July first, when a cover crop of some sort should be sowed. If the seed is not too expensive, some leguminous crop like red clover or crimson clover at the rate of about 12 pounds per acre for the former and 10 pounds for the latter, or summer vetch at the rate of 50 pounds per acre is advisable, as these will add a considerable quantity of plant food to the soil.

If too costly, rape may be used as a cover crop, at the rate of 30 pounds per acre.

THE SOD MULCH SYSTEM, if properly handled may be advisable on moist soils where there is abundance of plant food. This system must not be confused with the SOD SYSTEM. which is not to be recommended. If the former, for the first few years grass or old straw is hauled on to the orchard and placed around the trees to form a mulch. This practice is continued until the cuttings from the sod beneath the trees is sufficient in themselves to form a heavy mulch.

M. B. DAVIS, Pomologist.

TIME FOR THE FIRST SPRAY

By G. E. Sanders

When the leaves are the size of a ten cent piece, the first spray should be applied.

In most orchards this spray should be 3-10-40 Bordeaux and 1 pound of arsenate of lime to 40 gallons. Where there are indications of an outbreak of aphids, 1 pint of Black leaf 40 should be added to 100 gallons of solution. Add the Black leaf 40 the last thing before the spray goes on the trees.

In making the Bordeaux begin by putting the powdered copper sulphate into the spray tank or into the strainer and start filling, running the agitator while filling. When the tank is two thirds full dump in the hydrated lime and then add the arsenate of lime. Be sure to use at least three times as much hydrated lime as bluestone in making Bordeaux for the apple.

Te first spray controls the Budmoth, Brown tail Moth, Tent Caterpillar, Canker Worm and Apple Scab. In order to do good work on the Budmoth with this spray, it should be applied as a drench and at high velocity.

In 1913 missing this spray meant no crop of apples in Nova Scotia. On two other occasions during the past ten years it has meant very dirty fruit. Last year we very narrowly missed a repetition of 1913. This year we have an early spring similar to 1913 and it may be that our first spray will be as important this year as then.

CERTIFIED SEED POTATOES

(Experimental Farms Note)

This term is applied to potatoes which have passed two inspections made by inspectors of the Division of Botany, Experimental Farms Branch, Department of Agriculture. These inspections are made (1) of the growing plants during the blossoming period, and (2) at the time the tubers are dug, or after they have been placed in storage.

While purity of variety is given due consideration in determining the claims of a crop to certification, the prime object of this work is the absence and, incidentally, the control of disease, particularly of constitutional diseases such as Leaf Roll and Mosaic, which have proven to be responsible for a serious reduction in yields in many parts of the country. As the only possibility of distinguishing the presence of these diseases lies in the inspection of the growing plants, it is obvious that in order to ascertain the presence of, or freedom from, Leaf Roll or Mosaic in any crop, inspection must of necessity commence in the growing season and preferably during the blossoming period, as it is at this time a matter of small difficulty to distinguish any impurity of variety. Thus the two-fold object is attained.

At the conclusion of the inspection of a field of potatoes, the inspector hands to the grower a record showing the exact condition of his crop. Should the field be found to measure up to the required standard, the grower is again visited at, or after harvest time and an inspection made of the tubers to ascertain to what extent, if any, diseases such as Common Scab, Rhizoctonia, etc., are present. Should this final inspection prove satisfactory, the potatoes are graded as either No. 1 or No. 2 Grade Seed Potatoes, and a sufficient number of tags to cover the number of bags or other containers necessary for the shipping of the amount of potatoes inspected, are issued by the inspector. These tags certify that the contents of the bags or other containers to which they are attached, have been grown by the person whose name apepars on the tags; that they have been inspected by an officer of the Dominion Department of Agriculture and found to be sufficiently vigorous and free from serious diseases, other pests and foreign varieties to warrant them being classed as No. 1 (or No. 2) Grade Seed Potatoes.

On the other hand, if a field fails in the field inspection to measure up to the required standard owing to the presence of a larger percentage of diseases or impure varieties than is allowed, it is given no further consideration; the grower being advised to change his seed and to procure for this change, seed potatoes from some grower whose stock has satisfactorily passed both field and tuber inspection.

This work is being carried on at present chiefly in Northern Ontario, in parts of New Brunswick, Quebec, Nova Scotia and Prince Edward Island. tI is proving of value to the grower in that it frequently reveals to him the loss which he is incurring by the use of diseased seed, and is also a means of putting him in touch with the grower from whom it would be advisable to obtain a supply of

A Shorter Route to Bigger Farm Profits

—quicker results, bigger production, reduced costs—all these are made possible by the use of C X L Stumping Powder. There are many uses to which the farmer can put

C X L Stumping Powder

either to develop the new farm or improve the old.

C X L Stumping Powder removes stumps, blows out boulders, digs ditches, breaks up subsoil, and does tree planting in half the time and at half the cost of other means.

And it helps growth—increases production. "Explosives for the Farm" tells why. Write for free copy.

GROW STRAWBERRIES

We WANT your order for STRAWBERRY PLANTS this coming season. Of course you are planting a larger acreage than usual,—everybody's doing it, for strawberry growing at the prices now days is a sure fire money maker. The Canning factories are anxious to buy all the berries they can secure, so we now have no fear of over production. Get our plants and be sure of big crops. Senator Dunlap, Warfield, Beder Wood and Dr. Burrell, six dollars a thousand. Sample, Glen Mary, Premier and Bubach seven dollars a thousand. We allow one dollar a thousand discount from these prices on all orders of four thousand or over of one variety. Send for Catalogue. It's Free.

CYRUS & MANNING ELLS, Port Williams, N. S.

"Certified Seed Potatoes" as outlined above.—Geo. Partridge, Assistant Plant Pathologist, Central Expeirmental Farm, Ottawa, Ont.

DISEASES OF BEES

(Experimental Farms Note)

Bee diseases are of two kinds:—Diseases of the adult bee, which, happily, in Canada, have so far been of a transient nature, because no effective treatment is known; and diseases of the brood, of which there are three, American foul-brood, European foul-brood, and Sacbrood.

Since each of these three diseases is treated differently, and since the first two cause great loss when neglected, it is important that every beekeeper should be able to recognize and distinguish them so as to treat the serious ones effectively and without delay.

The diseases affect the larva or worm stage of the bee.

On American foul-brood, the larva, just afte rcapping, becomes a coffee-colored mass whic his so tenacious or viscid that it will rope out sometimes to a length of several inches if a tooth-pick be inserted into the cell and withdrawn, and it has an unpleasant glue-like odor. The mass dries down to a scale that adheres tightly to the lower wall of the cell. The capping of the cell containing the affected larva is usually discoloured; it is often irregularly perforated, or it may be removed altogether.

In European foul-brood, most of the larvae are stricken before they are capped over. They lose their shape and collapse at the bottom of the cell, appearing as if they had been melted and turning to a light straw or gray colour. The decayed brood has a slightly sour smell to which is sometimes added a strong odor of putrefaction. The mass ropes out either not at all, or but little; and the dried scale is easily detached.

In Sacbrood, the full grown larvae lies stretched out on its back in the cell, discoloured but with skin and shape intact. The juices of the larva are watery and contain curd-like particles.

American foul-brood is treated by shaking the bees into a clean hive containing frames fitted with foundation without any of the honey, and taking away the combs of the brood and honey which contain the spores o fthe disease. The bees must not be allowe daccess to the honey unless it has been boiled for an hour, although it is fit for human use. The combs may be rendered into wax. The hive should be disinfected by scorching.

European foul-brood is treated by introducing young Italian queens and keeping the colonies strong and well supplied with stores. This disease will spread very rapidly during a honey dearth in late spring and early summer. In severe cases, the colonies should be left queenless for one or two weeks before the Italian queens are introduced.

Sacbrood usually disappears after a few weeks and calls for no treatment.—F. W. L. SLADEN, Apiarist, Central Experimental Farm, Ottawa, Ont.

CONTROL OF SWARMING

(Experimental Farms Note)

Swarming is the bees' natural method of increase, and the instinct to swarm is particularly strong under the extremely favourable conditions for bee activity of the Canadian spring and summer.

The uncertainty of swarming, the loss of honey following the division of the working force of the colony, the possibility of swarms escaping, and the difficulty in preventing swarming in many parts of Canada without considerable labour, all make the control of swarming quite the greatest problem in bee management.

To encourage work in the hive and to discourage the desire to swarm, plenty of room, both in the brood chamber and in the super, and large entarnces should be given to all colonies as soon as conditions are favourable, but these measures will not always be enough to prevent swarming in many places, especially in the north.

If the apiary can be watched all day, it is a good plan to clip the queen's wings at fruit bloom time. When the colony swarms, remove the hive to a new stand place, on the old stand an empty hive, to which the swarm will return, the queen having been meanwhile picked up and placed in a cage in the new hive. The field bees will join the swarm and the parent colony will be so much weakened by their loss that ti is not likely to swarm again.

Where the apiary cannot be watched, the plan of preventing swarming by examining every brood comb in every colony every week, and destroying all the queen cells is very laborious and not always effective. A simpler plan is to remove the queen at the beginning of the clover honey flow, and eight or nine days later, destroy all the queen cells except one, or destroy all and give a ripe cell of select parentage. In this way a young queen is obtained which will not swarm and, besides, will be more prolific in the fall and next year than the old queen, and will be less likely to swarm next year. The plan, however, causes a certain amount of loafing until the new queen starts laying. This loafing can be much reduced by introducing a ripe queen cell at the time the queen is removed, and if this is done early enough before any preparations for swarming have been started, the bees are unlikely to build further queen cells. Where, however, one prefers to use the surer method, only those colonies that are actually preparing to swarm should be treated, and some means for quickly ascertaining if a colony is building queen-cells in preparation for swarming should be employed. One of th ebest of these is to have the brood nest occupy two chambers, and then by prying up the upper chamber, one can see at a glance if the queen cells are being built along the lower edge of the combs in this chamber.

In many parts of southern Ontario, southern Quebec and similar regions the desire to swarm is strong only during the first two or three weeks of the honey flow from clover, and the separation of queen and brood by a queen excluder, the queen being put into a lower chamber containing only empty combs and foundation, may be enough to tide the colony over this period. Another good plan that may be enough to prevent swarming in this region is to use two brood chambers and confine the queen to the lower one early in the honey flow, at which time the combs in this chamber usually contain a large number of empty cells.

F. W. L. SLADEN,
Apiarist.

SHIFTING PLANTS IN SPRING MONTHS

The efficient shifting of plants depends upon the strict observance of a few general but exacting rules. First, the roots must be fully protected against drying while out of the ground which necessitates the exercise of oversight during this period. Protection from sun and air to the entire plant, when of a succulent nature, and to the roots of bush fruits and other nursery stock, is required. Then, too, under certain conditions of air when evaporation is exceptionally great, it is advisable to dip or sprinkle the plants with water as they are taken from the ground, to assist in maintaining the desired degree of succulency in plant tissue.

The second point to consider is that of pruning, the purpose of which is to conserve plant vitality by reducing the proportion ofsurface tissue, and to promote plant vigor by securing equality between root and branch. With plant bed seedlings this purpose is best attained by cutting away the top with shears or sharp knife; and the same is true of bush fruits and nursery stock in general. With strawberry plants the end is best attained by stripping a portion of the leaves. In all cases a certain amount of root pruning is also desirable.

Because of the respiratory processes going forward during active plant growth, assisted by the agencies of sun and air evaporation from the surface of this succulent growth is very rapid; and even though it be true that respiratory action may largely cease when plant or tsee is semoved fsom the soil, the influence of sun and air still obtains, hence the urgent need of providing immediate protection from these agencies, that succulency in plant tissue may be conserved as far as possible, till the roots are reestablished in new feeding grounds.

Kills Bugs and Worms
Kills Weeds

THIS All-Canadian spraying machine has been on the market over 25 years, and proven best for Canadian use. In that time it has repeatedly met the world's best in competition and captured over 100 Gold Medals and First Awards, including the coveted Canadian Government spraying contest award.

A Spramotor will double and treble your yield of apples, pears, peaches, grapes, plums, etc., and get you better fruit. It will do the same with potatoes and row crops, kill mustard in the growing grain, spray paint, whitewash and disinfectant on barns, stables, pens, etc., six times as quick as by hand. All styles and sizes, $7. to $400.

FREE! Crop Disease Booklet containing Government Reports and information. Write for your copy to-day.

5. SPRAMOTOR CO., 23 KING STREET, LONDON, CANADA.

Masters Rapid Plant Setter

The only practical tool for transplanting all kinds of plants, TOBACCO, TOMATO, CABBAGE, CELERY, CAULIFLOWER, PEPPERS, EGG PLANT, STRAWBERRIES and all similar plants. Capacity 8000 to 15000 plants per day.

Each plant is set, watered and covered in one operation without any stooping or lame backs. It makes good always.

We guarantee your complete satisfaction or your money refunded. Order one today.

Price $10.00

The Lock that Holds

I can go over a cow that has been curried every day, and give her a good thorough combing and brushing, in two minutes. If you do it only once in a while it will be a different story, like the old woman who couldn't see how some women could comb their hair every day; she only did hers once a year, and then it almost killed her.

Grooming milk cows helps their circulation and keeps their skin in a better working condition. In winter they miss the showers—Nature's both—that occasionally wash them when on pasture, so we can supply the next best substitute by grooming them each day. It increases your pride in your herd, for one that is groomed every day will look fifty per cent. better than one that is not.

When engaged in grooming a cow you will find out many little things about her that you might not otherwise know. Any hidden sores or tender spots needing attention will be brought to light; their handling qualities and condition of hair and hide will show themselves. You can learn many of the good and bad points of a cow from the judge's standpoint by currying her. The extra handling makes her more tractable and she will like you all the better. Anyone who has done much of it knows how jealous some cows get when the one next to them is being curried. They like it without exception, if you do not handle them roughly or get in too much of a hurry.

Nor should your efforts be confined solely to the cows you milk. Calves of all ages are fond of at least a brushing, and will become so much more tame and docile that it is time well spent for that reason alone. Your herd sire will thank you as much for his daily grooming as any animal, and if you have to spend five or ten minutes a day upon him, remember you are getting off cheap at that, when you can go over half your herd in that length of time.

I think it is a mistake to believe that grooming is only warranted where purebreds are kept, for I believe that a profitable cow will do enough better at the pail to pay for your work grooming, even though she be what is technically known as a scrub. Perhaps you keep too many cows and could let half a dozen of the poorest ones go to where they won't need to be groomed. Then you will have that much more time to put on your better ones. Give them as square a deal as you do your horses. They get curried before every day's work, but because a milk cow is so quiet and unobtrusive about her work and doesn't get in a sweat over it like a horse, she must often look on in vain longing while some horse that works eight hours a day, less than two hundred days a year, gets what she is more deserving of.—L. W. C.

Primrose is different from all other cream separators in several very important points.

Here is one:

PRIMROSE is the *only* separator with two wide-open cream outlets. There is no cream-wasting screw in the path of the cream. The regulating screw is in the skimmilk outlet. Adjusting it there, you get the exact density you want—and all your cream goes out of the two always-wide-open cream outlets. This practical, sensible, Primrose separator improvement is saving cream and money that cannot be saved by any other separator. We stand behind this statement. Primrose efficiency has many other good reasons.

DAIRYING.

GROOMING THE DAIRY COW

One of the biggest problems in housing milk cows is to keep them clean. No matter how much bedding is used for cows in stanchions, unless there is an alignment device and a wide and deep gutter behind them, their tails and hindquarters are sure to get dirty. A rearrangement of their bedding twice a day helps, as does also keeping those parts clipped. But the thing that will improve their appearance the most is a good treatment with a curry-comb and brush six times a week.

We have found the best all around curry-comb for cows to be one consisting of four concentric circle strips of thin metal both edges being cut into teeth all the way around. A cylindrical wooden handle is attached to this in such a way that both sides of the comb may be used. After using it awhile, it is preferable to use one side for the bulk of the work, keeping the teeth on the little-used side sharp for obstinate places that need greater penetration. The teeth are almost too sharp on a new comb, and they can be dulled a little with a file. A good, strong oval brush, with fairly long stiff bristles is preferable. I always use the comb in my leading hand, and the brush in the following one, using the latter almost entirely around to the legs and tender places.

PERFECTING THE MILKING MACHINE

Of the many modern farm labor saving appliances that the high cost and scarcity of farm help has occasioned none have created greater interest to the dairy farmer than the milking machine. Milking is the one chore at a dairy farm that is badly hit by the scarcity of manual labor that hitherto was the only medium, and perfecting of the milking machine has now overcome this seriou shandicap to the industry.

The modern milking machine is a practical and safe labor saving device. This has been proven under rigid test at the Experimenta Farms and is also borne out by the experience of practical dairy farmers. Representatives of this paper have been able to make personal observations of them in use on a large number of farms and have found the farmers generally well pleased. It is safe to say that a dairy man who installs any standard make of milking machine in his barn is now as much on trial himself as the machine.

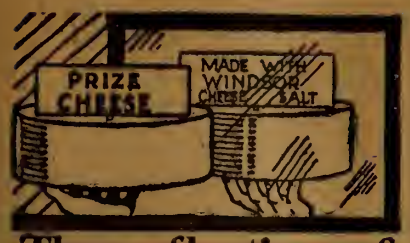
Failures in machine milking several years ago were rather numerous; due to a variety of causes, chief among them being that the owner did not fully understand the mechanics of the machines or fully appreciate the necessity of taking proper care in operating them and keeping them scrupulously clean, or in promptly and carefully stripping the cows after the machine milking. Failures due to similar causes have accompanied the introduction of practically every machine into the farming field.

Of late years, however, machine milking failures have been few owing both to the simplification of the machines by their manufacturers and the more intelligent operation of them by the owners. The best remedy for failures in the use of the milking machine is to become thoroughly familiar with the machine selected, its adaption to each cow, and what is required to keep it in order and sonitary condition.

Nearly all cows take readily to machine milking, and other conditions being similar, they will yield as much mil when milked by machine as by hand, if they are always promptly and carefully stripped by hand after the milking with the machine has been completed. The machines properly operated do not injure the teats or udders of the cows, or cause garget or other udder diseases. Prompt and careful hand stripping is the most important factor in successful machine milking, even though the machine used leaves only small amounts to be stripped out.

A cow with a good production record will sell more readily for a better price than one whose capacity for production is unknown or whose reputation in this line depends entirely on your "say-so." If therefore, you are unable to have your cows officially tested it will pay you to keep their individual records yourself (as well as costs of keeping) to show to prospective purchasers and to enable you to price the animals equitably.

Be it remembered, however, that good dairy herds are not built in one generation. The price of success in developing dairy herds is continuous, persistent, intelligent efforts. Those who make it their business to breed livestock find that even a lifetime is too short for acomplishing the coveted results.



The reflection of it's excellence

RETENTION OF AFTERBIRTH

Retention of the afterbirth is a very common trouble in dairies and occurs more frequently with cows than with any other animals. The trouble is not serious in itself to the health of the cow, unless through some complication, set up by the absorption of the fetid matter, and the effect of this upon the milk. The cause of this defect is supposed to be the earliness of the calving and the immaturity of the preparatory conditions of the uterus. There is just the possibility that it is one of the phases of abortion and it will be safe to treat it as such, and keep the animals so affected isolated by themselves, and the barns well cleaned and disinfected. There is no medicine that would prove of any benefit to give the cow before freshening. You must always remember that the cow has her young calf to feed and any strong medicine might act detrimental to the young one's healthy growth. There could be an improvement in your feed. You are giving your cows too much dry matter without any green or succulent food like roots or ensilage. There is quite a waste of energy in the cow that is fed dry corn stalks that could be conserved by the use of a silo, and a great quantity of the succulence escapes in the stooking and dry storage in the barn. A whole winter, up to March, on corn stalks and oat straw, with only a little bran as a laxative or succulent feed is not very good treatment for pregnant cows. There are quite a number of farmers who entertain the idea that a dry cow, that is pregnant, has nothing to do but wait around till freshening, consequently she is fed on a very low milk producing or calf-growing ration. Irregularities at birth often follow such a winter treatment. Pregnant cows should get lots of succulent feed, and their bowels should be in loose condition when approaching freshening time. The treatment under the special circumstances varies with the nature of the case.

If there are no complications and the cow performs her functions satisfactorily, the atferbirth may be left for a week or so, until it parts naturally; but if fever or other disturbances of the system occur and the animal is suffering, the following dose should be prepared: one ounce of Savin leaves, and half an ounce of carbonate of potassa in one pint of water. The decoction is strained and given luke warm, and the dose is repeated every six hours.

Do not attempt to take it away by force unless you employ a skilled veterinary. The reason for this precaution is owing to the foetal membranes being still attached to the surface of the uterus, and to take them away without the aid of veterinary skill would cause serious injury to the cow and probably prove fatal.

BLOODY MILK

Bloody milk is not at all unusual in heifers with first calf, and usually it will disappear after a time. It if occurs in older cows, it is usually caused by injury, such as bruising by being stepped upon. The presence of curdles would indicate that there was garget, and I would suggest bathing the udder once a day with hot water, and after drying off, rub in well a little camphorated oil, massaging udder well. Give in feed twice a day for a week at a time a tablespoonful of saltpetre.

According to recent investigations made by the Director of Milk Supplies in England, it is costing to produce milk in the British Isles, 68c per gallon, or $6.80 per 100 pounds. In arriving at the above figures, feeds were valued at the cost of production rather than the selling price, and wages figured at the minimum scale allowed for the County of Derbyshire. Hay was valued at $33.60 per ton; straw, $12 per ton; roots, $6.48 per ton; oil cake, $120 per ton, less the manurial value. Allowance was also made for depreciation of the cows, buildings, etc., rent, repairs, depreciation on machinery, etc., replenishing the herds and cost of maintaining dry cows.

Udder troubles are few in the herd of the careful owner. Guard against injury to the cow and provide ample bedding to cover the cold concrete floors in winter.

While we realize that countries where heavy dews are prevalent and succulent feed abundant, sheep may get along with less water, yet it is sometimes wondered if all our farmer sheep raisers will ever realize that after all good drinking water is the cheapest of all good sheep feeds.

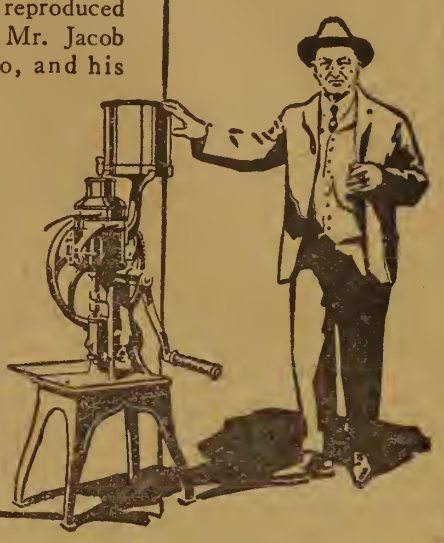
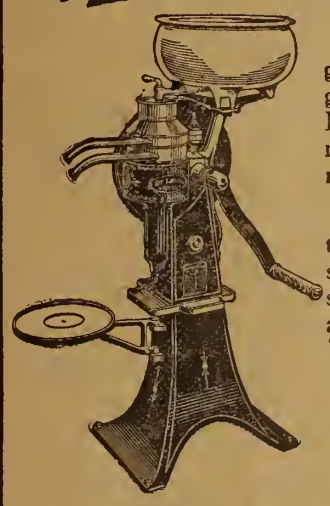
DURABILITY OF THE
DE LAVAL

This illustration is reproduced from a photograph of Mr. Jacob Rimelspach, in Ohio, and his DeLaval Separator, which has been in use for over 25 years.

The machine was brought in on a local De Laval Service Day to be looked over by the service man.

There was nothing the matter with the separator, and after it was cleaned up and oiled Mr. Rimelspach took it home with the comment that it ought to be good for another 25 years.





The De Laval Separator gives the greatest value for the money, because it gives better and longer service. Mr. Rimelspach's experience is equaled by the records of a large number of De Laval machines.

Considering its greater durability alone, the De Laval is the most economical separator to buy; and with its cleaner skimming, easier running, greater capacity and unequaled service, the price of a "cheaper" machine is high in comparison.

If you don't know the De Laval agent in your community, write to the nearest De Laval office

LIVE STOCK.

LIVE STOCK NOTES

The following quotations are from a recent report upon the Exhibit of the Two Champion Canadian Steers in France, by Mr. P. W. T. Ross, who was secured by the Department to take care of the Exhibit:

"The price of our cattle, lean steers 400 kg. (or 880 lbs. Canadian) is apparently 2,000 francs laid down French port; this is figuring on following basis: price in Canada $85.00 at 11 frcs to the dollar 934 frcs
Transportation $100 at 11 frcs to the dollar.....1100 frcs

2035 frcs

"The price of lean cattle about 400 kg. (or 880 lbs. aCnadian) is quoted in Normandie variously between 1200 francs and 1800 francs, but the mean price can be said to be 1600 francs, depending on condition of animal, the market price being safe to calculate at 4 francs per kilo (2.2 lbs. Canadian.)

"The time for lean cattle to come into the market for herbagers (cattle raisers who buy cattle for grazing and fattening) is from February to April, and this can include January and even May; consequently large demand may be looked for in 1921 and 1922. A certain number can also be sold in June—if you put them on markets contiguous to herbagers. Lean cattle are imported generally from departments of La Manche, Mayenne, Vienne et Maine & Loire, where breeding is practised.

"System practised in Normandie is that beasts bought are put to grass between 15th of February and 15th of March; between 15th and 31st May those having thrived best are put on the market, the rest being sold at the second series of sales of fat cattle between the 15th and 30th of November.

"The farmer or herbager is not going to buy unless he knows what he is buying and can see it. In Normandie they want us to put some lean cattle on their uocal markets.

"It is suggested that Canadian exporters send a trial shipment of neat cattle to France immediately for May delivery in grazing districts; that they hire their pasture land in Normandie and advertise the cattle as plenty of herbagers would come from all parts of Normandie whether the cattle be in Calvados or Seine Inferieure; that Mr. Sam Cooper, who knows this country now and could easily handle the care of the beasts, say 200 or so, be put in charge, taking them to various local markets or fairs for sale; that if price achievable showed a loss, cattle unsold be kept on pasture to be sold fat on any market.

"There is a tremendous prejudice against frigorific meat in France. You can not change them. The French are the best "cuisiniers" in the world and they cook a rump steak or tastic like a porter-house. Nevertheless frigorific meat is of course sold in France to some extent. I might add also that France is in principle an exporter of cattle; we have a chance here ,it might be estimated, for at least 5 years. But we have all Europe after that and besides, should be able to work from France.

"Exchange is uncertain, is a fetish anyway and often made an excuse for inactivity; something must be done and now by Canadian commercial men, exporters and raisers for the cattle are needed and they have to be on the ground at first anyway to show these 'men from Missouri.' "—Live Stock Commissioner.

CANADIAN CO-OPERATIVE WOOL-GROWERS, LIMITED

Toronto, Ont., May 8.

Dear Sir:—

We should like to advise you that we have secured the services of Prof. W. H. J. Tisdale for this organization and expect to have him at Toronto on or about the middle of the present month. Prof. Tisdale was formerly connected with the Animal Husbandry Department of the University of Saskatchewan Saskatoon, and has proven his ability in sheep husbandry. We therefore feel in having Mr. Tisdale connected with the Canadian Co-operative he will thoroughly understand the probelms of sheep industry in Canada and will be most invaluable in the future development of sheep and wool work in this country. It will be our endeavor before the year is out to have Prof. Tisdale call on the various Sheep Breeders' and Wool Growers' Associations so that we may know the difficulties under which they are working and likewis that they may know some of our difficult problems.

Mr. W. W. Thompson formerly Director of the Co-operative organization work in the Saskatchewan Department of Agriculture, Regina, has joined the staff of this organization and is already busily engaged in the work in the Provinces of Manitoba and Saskatchewan. Mr. Thomas is very highly thought of by the De-

Cord or Fabric.

Chance never drew a neat picture nor built a fair house.

In the making of Partridge Tires nothing is left to chance—detail perfection is secured by craftmanship scientifically directed, and rigid inspection insures outstanding quality.

Partridge Tires are all that good Tires can possibly be.

THE BANK OF NOVA SCOTIA

We invite your account. Special facilities for banking by mail. Thirty-three branches in New Brunswick. Head Office, Halifax, N.S.

36A

partment authorities at Regina and had very marked success in his work with that Department. We therefore feel confident that the interest of the wool growers will be well looked after in these two Provinces by Mr. Thomson.

In the Province of Quebec where there exists a number of Wool Growers' Associations we have endeavored to have the various Associations cut down to a central grading point and for this purpose there is under construction and will be completed this month, a warehouse at Lennoxville, Que., with a capacity of some ten thousand square feet. In charge of this work at Lennoxville we have Mr. L. V. Parent, formerly District Representative at Richmond, Que., of the Quebec Department of Agriculture.

The construction of the third floor for grading at the West on Warehouse is well under way so that when the season opens we are very hopeful that the Western wools will be centralized at Weston for grading, sent in from the various Wool Growers' Associations in the West; Ontario wool will be centralized at Guelph and Quebec wool at Lennoxville. In the Maritime Provinces, New Brunswick has one grading station at Fredericton; Prince Edward Island one at Charlottetown, and in Nova Scotia there are two or three grading stations this year but we hope another season the Associations will determine upon one grading station only.

The organization is now equipped to handle a very fair volume of business from every standpoint. The lower grades of wool are as you already know, a very difficult problem under the present market conditions. However there is this, they are not more difficult for us than for any other wool house and we feel confident and trust that we have the support of the Associations and their Secretaries that the wool will be given more attention through this organization than if handled in any other way.

Yours very truy,
CANADIAN CO-OPERATIVE WOOL GROWERS, LIMITED

SWINE BREEDERS INCREASE FEES

At a special meeting of the Canadian Swine Breeders' Association held March 16, 1920, the following schedule of fees was adopted and will become effective May 1, 1920:

Annual memberbship	$2.00
Registration of animals under one year of age, to members..	1.00
Registration of animals over one year and under two years of age, to members	2.00
Registration of animals over two years of age to members..	3.00
Transfer of ownership, for the first, if made at the time of registration of the animal, free, all other transfers, to members	.50
Transfers which may be necessitated by a change in a firm where no consideration passes, free.	
Duplicate certificates, to members	.50

To non-members, double the above fees will be charged.

THE EASY FEEDING THRIFTY HOG

The two points most indicative of a quiet dispositioned easy feeding early maturing hog are head and flank. The rump should be almost level with long coupling and tail well set up in line of the back. A short coupling is nearly always accompanied by a round rib high flank and not enough body depth. The ham should be even with the rib and side line and let down well to the flank but not out of line or proportion with the rest of the body.

A big bulgy ham is very seldom seen on a well proportioned hog, whose top and side lines are even and where the flank is properly let down. A very wide ham goes with a high flank and round rib which generally means not enough depth and width below. A baggy ham at the bottom often, termed by breeders a "meal sack" ham, is undesirable to the packer, all the lower flabby meat being waste.

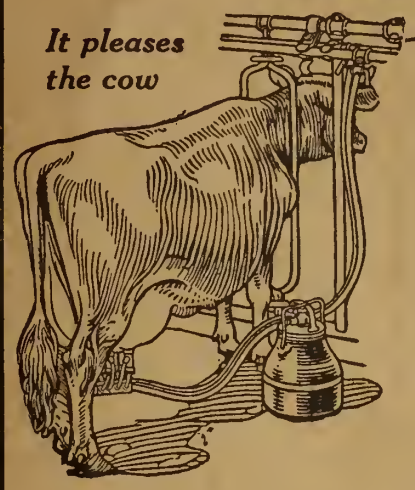
The De Laval Milker

It pleases the cow



Letter from a large U. S. Dairy.

Having now used a six unit De Laval Milker for nearly four years on more than one hundred cows, we wish to say that we are very well satisfied with the working of this machine in every detail.

The cows all take kindly to the De Laval Milker. With labor conditions the way they have been for the last three or four years, we would have to dispense with part of our cows had it not been for the De Laval Milker.

And we must say that the service you render De Laval users is prompt and effective.

Henry Becker & Son, Inc.,
Roseland, N. J.

THE De Laval Milker is a tried and tested De Laval product. It is a distinctly different type of machine, positive and uniform in action.

The De Laval is faster, more reliable, more sanitary than any other method of milking. Its action is gentle and soothing from the start—old cows that are hard to milk, heifers and high-strung purebreds are all milked successfully.

The De Laval Milker is made and sold by the same Company which for over forty years has earned an enviable reputation for service to users. When a man buys a De Laval product, the Company considers that its obligation to him has just started.

Write to nearest De Laval office for Milker Catalog, mentioning number of cows milked

THE HORSE

SHOULDERS AND PASTERNS DRAFT HORSE SHOULD HAVE

The distinctive characteristic between horsese bred for heavy draft work and those bred for light work or speed are very readily detected in the shaping of the shoulder and the formation of the forelegs. Perhaps no draft breed of horses shows a better combination of the two qualities of power and speed than the Clydesdale, and the shoulders are, perhaps, the most distinctive. There are breeders of draft horses that do not place very great merit on a sloped shoulder; they maintain that a horse with a straight or more upright shoulder is the better adapted to pull heavy loads than the more sloped conformation. Each draft breed has its advocates and are chosen to meet some special adaptability to popular demand or fancy, and are considered by the breeder better fitted for his particular ideals or work.

Shoulders for Speed and Pulling Power

In order to better understand the difference in draft and speed conformation, the shoulder and fore leg formation of each of these types have to be considered. A similar difference is also found in the formation of the hind legs of both types of horses. Leaving out of consideration the great difference in thickness of the draft horse in comparing him with the light or trotting horse, they differ in some respects in two important things, the slope of the shoulder blade and the length of the forearm.

In the trotting horse the knee comes very low down, and the distance from this joint up is very great. While in most breeds of the draft horse the shoulder is inclined to be more perpendicular with a thick short forearm. This difference gives the one an advantage in speed and the other in pulling. The shoulder of the horse that has a little less slope than that of the trotting horse bears the pressure of the whole length of the collar. His conformation is less liable to have collar sores on his shoulders. The class of horse that is most subject to collar sores is the one that is built on extreme light breeding lines, and is put to pull heavy loads, and at the same time keep up considerable speed.

The position of the shoulder in its relation to the use of the collar is especially important with the draft horse. It must not only have a desirable slant, but also a sufficient front surface along the base of the neck, to furnish a smooth and well inclined surface on which the collar may rest. Horses of light bred type have not this part well developed, and hence their unfitness for heavy pulling and their liability to sore shoulders. Any roughness of shoulder or lack of muscle covering will furnish conditions favorable to sore shoulders.

The Horse on Springs

Horses that have sloping shoulders generally have sloping pasterns and a springy movement. All horses at work either trotting or pulling, strike the roadway or street with considerable force at each footstep; the sloping formation enables the animal to withstand the great shock and concussion. In the early history of draft horse breeding it was not considered necessary to develop this formation, as the movement of the horse was slow and the land under the hoof was soft and free from the hard shocks of concussion. But what is required in a modern draft horse is an animal with speed and power combined, one with conformation to pull a ton or two on a city street, and at the same time be able to withstand the shock from the hard surface over which they have to pull the loads. This combination has been zealously watched in the development of the Clydesdale in which the springy pastern, the muscular short forearm and sloped shoulder make up a speed and power formation not found so well developed in any other breed.

This combination has made the Clydesdale the greatest gelding getter of modern times. The progeny of a typical Clydesdale stallion from common mares have all the stamp of speed and power, and are well fitted to furnish the cities or farms with that class of animal that can pull considerable loads on city streets with ease at a trotting speed. It is this combination that makes the Clydesdale breed essentially the one for grading up common stock, as well as producing the heavy gelding from the heavy class of grade mares.

The Desirable Type of Drafter

The shoulder of the draft horse should slope well into the back and should form that happy medium in position somewhat akin to that of the thoroughbred. The perpendicular shoulder and fetlock does not conform to the typical leading in the best type of draft horse. The straight shouldered animal has no conformation for endurance on hard streets, where the best draft horses are required. The straight pastern forms no cushion for the shock at each foot fall.

Though the thoroughbred horse is in striking contrast to the broad compact and massive form significant of power in the draft horse, there are several characteristic distinctive of the thoroughbred type that are found in a good type of heavy class, and these are sloping shoulders, well knit withers, muscular quarters, and clean, hard, flat bone.

It has been very well demonstrated that the Clydesdale comes nearest to this desirable type of drafter and exhibits most of the original thoroughbred breeding that is the chief foundation for nearly all varieties of horses in domestication today. He has the thoroughbred spirit and speed with all the power that has been generated in any breed of drafters.

ABSORBINE
TRADE MARK REG. U.S. PAT. OFF.

will reduce inflamed, swollen Joints, Sprains, Bruises, Soft Bunches; Heals Boils, Poll Evil, Quittor, Fistula and infected sores quickly as it is a positive antiseptic and germicide. Pleasant to use; does not blister or remove the hair, and you can work the horse, $2.50 per bottle, delivered. Book 7 R free.

ABSORBINE, JR., the antiseptic liniment for mankind, reduces Painful, Swollen Veins, Wens, Strains, Bruises; stops pain and inflammation. Price $1.25 per bottle at dealers or delivered. Will tell you more if you write. Liberal Trial Bottle for 10c in stamps.

The Tonic for Farm Animals

=OMAZON=

CANADIAN MEDICINAL FOOD

Strengthens and tonifies. Causes the prompt disappearance of Indigestion, Constipation, Worms, Colic, Diarrhœa, etc.
(It has saved hundreds of valuable animals)

On Sale Everywhere. DR. ED. MORIN & CO., Limited, Quebec, Canada.

The Arab of the desert is credited with spending his life on horseback. There is indication in this record of good springy action in the animal on which he spends most of his time. There are horses that one does not want to ride on any longer than they can help. It is a good test of the sloping shoulder and pastern and hence a freedom from jars, and accordingly an animal with lasting power. The amount of jar caused by the different formations of shoulder and pasterns, can be verified by anyone who cares to try it, by riding alternately on animales of different conformations. It can easily be noted that the straight, upright conformation gives a stilted jarring movement, while the sloping arrangement puts the rider on springs.

PHRENOLOGY IN HORSE SELECTION

A horse with a "muley" head is a muley brute all over. According to general descriptions, as gleaned from show-ring, sale-ring or farm-field observation by current literature on horses, there is very little written about this part of their anatomy. Irrespective of this overlook there is a whole lot of character and quality indicated in the head, and many other points that are not listed in the score card, or in the estimation of those who wish to buy a horse or choose one for the breeding stud.

Many people believe that they are adepts at summing up the "quality" of their fellow man at the first chance meeting. The expression, to them, they claim, is visibly exposed in the general outline of the individual, long before that individual shows it in word or act. This "Phrenology" or bump reading is not a myth either, and can only be acquired by close observation. When applied to the scrutiny of a horse, a truer deduction can be drawn; the man may be on guard and fake his appearance, but the horse is more honest, or rather is incapable of appearing what he is not.

No animal in domestication is more closely associated with man than the horse, but it is a remarkable fact that there are only comparatively few people that take any special regard to horses' individual characteristics as judged by indications taken from their general appearance. There are indicators in the physical construction of all animals that largely reveal the constitutional make-up of the whole organism, and a study of this phase of animal life is not without its value in judging or choosing a horse. The term quality is often very loosely applied, and is generally confined, in the survey of the horse, to some detailed points that very often have no close relationship to those qualities that perhaps exert as much predominating influence in the animal as a breeder, as any of the other points that are more exclusively recognized.

Head Conformation and Personality of the Horse

With some judges the head and the personality of the horse is the first to catch the eye. With others, it is recognized that if the feet are not right it is not necessary to look any further up the body. There is more danger of the breed losing character by the man who never looks at the head, than by the man who has the keen sense of a horse's bearing or "intelligence," as indicated by the conformation and general outline of the head. Not only is it the one part from which it is possible to penetrate the secret of a horse's disposition and character, but it also gives indication of the future possibilities in regard to the animal's fitness to improve the species in the breeding operation.

To breed with an animal that has a large, fleshy head is certain to find the progeny with a tendency to coarseness of fibre and a looseness in conformation. The faults of head conformation are peculiarly prepotent in horses, an are thus a factor in setting up type that is not without its significance. Neither too large or too small; it is the medium, well balanced head that carries favor. A large head if not covered with a thick skin and is not fleshy, is better than a small head. The small head is generally more popular than the large, but it is equally as faulty, if not more so than the very large one. A small-headed horse is more liable to digestive troubles than a large one. The masticating powers of the animal are less in a small narrow head than in a larger one, and digestion begins in the mouth.

The air passages are also small in a small head and the breathing organs are thus affected. But again, on the other hand if the comparatively small head is wide, the jawbone will be wide and strong, giving more power to the grinding of the food, and more room for the windpipe. A wide head is also accompanied with large and open nostrils, that give free action to the lungs. Narrow jaws show that there is a weak digestive system throughout, so also the small high set nostrils indicate weak respiratory organs.

The Ears and Eyes Tell Their Story

The ears are also great character indicators and like the head should be medium sized. As a rule a colt with small ears finishes up at an early age, and generally lacks substance. Large lop ears show a sluggish inclination, lack of spirit, and thus a short period of years of active usefulness. The ears should be active, refined, neither large nor small, carried close and erect, and turning slightly in at the tips. When the ears have an alternate backward and foreward movement, as if the eye also were following their guiding, the animal shows suspicion and lack of confidence in its surroundings.

One of the signs of bad temper is the prominent forehead between the eyes. Two bold eyes, one on each side of a wide flat forehead are signs of intelligence and good disposition, but eyes that are too prominent are objectionable features, and are found in horses that are hard to control when under nervous strain. Eyes sunken and lustreless, accompany horses with a sour disposition, and general vigor. It is the opinion of many horsemen, that when the white of the eye is too conspicuous a bad disposition is indicated. The white shows most when the horse gives a rearward glance, and kickers especially exhibit white when just about to kick.

The horse with health and vigor has an eye that is large, clear, full and bright, and more oval than round. These eye characteristics also indicate a kind disposition.

The outline of the front of the face

A Horse in the Fields is worth Three in the Stable

A horse that's working is paying for his keep. Three lame or sick horses in the stable are simply an expense From now on, you need your horses every day and all day. Get them in condition and keep them in fine condition, with

Dr. J. Woodbury's HORSE LINIMENT AND CONDITION POWDERS

With these reliable remedies in the stable (used by thousands of Farmers, Liverymen and Horsemen) you can rid your horses of all their ailments such as Coughs, Heaves, Colic, Distemper, Splint, Curb, Spavin, Enlargements, Glanders, Pink Eye, Cracked Hoof, Kidney Trouble, Fever, Sores, Bunches.

"I have used Dr. J. Woodbury's Horse Liniment for the past seven years for Coughs, Colds and Lameness of all kinds, and find it gives the very best results for Distemper. I certainly consider it the best on the market and would never be without a bottle in my stable."

WALTER SLATER—"Cash Livery"

Full directions are on each package so you can treat your stock yourself and keep them in prime condition at small expense. 105

Druggists and General Stores carry these reliable preparations.

Prepared by FRASIER, THORNTON & CO. LIMITED, Cookshire, Que.

1. In these days, anything that will save time and work is specially valuable. BT Steel Stalls will lighten your stable work. You can clean the stable in half the time. No solid partitions get in the way. Turn on the water and wash the stable with a hose.

2. The open partitions also make a simple matter of bedding down the Stalls, because you can put the straw through the open steel partitions very quickly. If you have solid partitions, you must bed each stall separately. This takes twice as long as it does with BT Stalls.

3. Tying and untying the stock is a quick, simple matter. It is often difficult to untie cow chains, especially if the animals are restless. You can open BT Stanchions as fast as you can walk in front of them. Send for the BT Barn Book and see how Steel Stalls save labor.

Send this coupon for the 352-page Barn Book. Tells how to plan and build the barn, how to ventilate, how to frame, how to save steps, labor, time and feed. This book saves you hundreds of dollars in building. It is free.

POULTRY.

RAISING THE CHICKS

Raising good chickens does not depend only upon the care of the chickens after they hatch, but it begins much farther back, with the mating an selection of the parent stock. Parent stock with poor vitality, immature, closely inbred, or kept in ill-ventilated, damp houses and improperly fed, will affect the strength of the chicks which come from their eggs. Improper incubation of the eggs will also affect the health of the chicks and their later development.

After the chicks are taken from the incubator comes the matter of proper housing, care and feeding. Chickens are delicate little beings and many of them suffer from lack of proper attention at the proper time. Leave the chicks in the incubator until they are at least 48 hours old.

The brooder house or coops should be of ample size and well ventilated, without drafts. If a brooder is used, the coal-burning type is by far the most satisfactory. The temperature under the hover should be 98 to 100 degrees during the first two or three days and then gradually lowered. An inch or two of sand spread over the floor, covered with a couple of inches of chaff or fine straw, makes an excellent litter. This will induce the chicks to scratch and will prevent leg weakness. Let the chicks out as soon as the weather permits.

Proper feeding has much to do with keeping the chicks healthy. No feed should be given them until they are at least 48 hours old. About the 19th day of incubation the yolk is taken into the body of the chick and serves as nourishment until the chick is at least three days old. After to days feed a good chick scratch grain, or rolled oats about 7 A. M. About 10 A. M. feed for 10 minutes a good, prepared chick mash, or a mash composed as follows: 20 pounds each of bran, corn meal and rolled oats; 10 pounds of fine meat scrap and five pounds of linseed meal.

At one o'clock feed prepared scratch feed in the litter. About five o'clock feed all the dry mash they will clean up in 20 to 30 minutes. Feed chick grit with the first feed, and keep them well supplied at all times with grit, shell, charcoal and green food. Keep clean water and sour milk before them at all times. Feed as outlined for the first month.

When the chicks are one month old, change the feed as follows: At 7 A. M., noon, and at 5 P. M., feed equal parts cracked corn, wheat and oats, or a good, prepared scratch feed. Omit the oats until the chicks are large enough to eat them. Keep the following dry mash before the chicks in open hoppers at all times; 200 pounds of bran, 300 pounds of corn meal, 100 pounds of middlings, 100 pounds of meat scrap or fish scrap and 50 pounds of linseed meal. Continue this feeding until the pullets are put into the houses in the fall. Chickens should be given as much range as possible. Keep them well supplied with sour milk, green feed, shell, grit, and charcoal. Keep them growing. A stunted chick is worthless.—O. M. Wilbur.

RATIONS FOR THE EGG PRODUCERS

Making up economical and efficient rations for the egg-producing flock is a problem that receives but little attention on the average farm. Experiments at some of the leaidng stations show that a saving of more than one-third can be made by feeding the kinds of feed that are adapted to the hen's requirements. Any system by which one can substitute accuracy for guesswork and reduce the cost of feeding more than one-third is well worth the careful study and attention of every farmer who keeps a flock of hens.

A mixture of the proper kinds of grain feed is one which carries enough protein to meet the requirements of the hen's system when she is producing a maximum number of eggs. Science has determined that animals cannot utilize carbohydrates in the making of protein products. On the other hand it is possible to some extent for animals to utilize protein in place of carbohydrates. Protein is needed to make bone, blood and muscle as well as the albumen of the egg. Carbohydrates, in connection with the fat, furnish energy to keep up the activities of the body. For this purpose pure fat has a value more than two and one-half times as great as the carbohydrates. For the smaller birds of the strictly egg-producing breeds a ration with a nutritive ratio of one to five, that is, one pound of protein to five pounds of carbohydrates and fat, gives the best results. In the case of the larger American breeds, where the percentage of carbohydrates and fat needed to maintain the activities of the body is greater, a little wider ration will produce equally as satisfactory results.

Digestibility and Palatability

The digestibility of standard grains and mill feeds has been pretty accurately determined so far as feeding ruminating animals is concerned, but recent experiments show that the hen can not digest her food quite so closely as the ruminants. This means that for the best returns in producing eggs the crude fiber must be reduced to as low an amount as possible with economy.

Palatability is the basis of success in making up economical and efficient rations for the laying hens. Success

PEERLESS PERFECTION
PEERLESS FENCE
FOR CANADA'S BROAD ACRES
Put up a fence that will last a lifetime—a fence that can't sag or break down—that will hold a wild horse—that hogs can't nose through—that can't rust—a fence that stands rough usage by animals or weather and is guaranteed. PEERLESS PERFECTION Fencing is made of Heavy Open Hearth Steel Wire with all the impurities burned out and all the strength and toughness left in. Heavily galvanized. Every intersection is locked together with the Peerless Lock.
Stiff stay wires keep it rigid, making fewer posts necessary. Send for Catalog today. It's attractive, interesting, well worth the stamp. Best dealers throughout Canada handle our complete line.

in getting eggs out of season depends largely on one's ability to coax the hens to eat the largest possible amount of properly mixed foods at the same time maintain a good vigorous appetite. Variety contributes toward appetite and increases the chances of success, but sufficient variety is usually present when several kinds of feed are being used to make up the ration. The sources from which the various materials supplied should come must be determined by palatability(digestibility and the cost.

Sme kind of animal protein is needed for winter feeding to take the place of worms and insects which are available during the summer. For this purpose, skimmilk and dried meat scraps give the most satisfactory results. Recent experiments indicate that the proteins of skimmilk and meat scraps assist in the digestion of the proteins of cereal grains. They also indicate that the proteins of corn, wheat and other grains are more readily and completely digested when fed in combination than when fed alone.

The Rations to Use

In putting the above principles into practice, the first aim in feeding laying hens is to feed them home-grown feeds to as large an extent as possible. Oats, buckwheat and cracked corn make an easy procurable grain mixture, well suited to the needs of the hens. Corn is very digestible, buckwheat considerably less digestible and oats somewhat less digestible than buckwheat.

Studying the composition and cost of the various protein feeds we find that by making up a mixture of 100 pounds of bran, 300 pounds of middlings, 100 pounds of oilmeal, 100 pounds of gluten and 100 pounds of dried beef scraps, and feeding it in the form of a mash that the hens will eat about equal parts of the mash and the whole grain, we can approximate the required one to five nutritive ratio, make profitable use of our home-grown feeds and at the same time furnish our laying hens with an ideal ration for egg production.

The mash ration is fed in hoppers, and the whole grain is fed in the straw litter; the amount being regulate by the amount of dry mash eaten from the hoppers. When feeding a wet mash in the morning the hens are inclined to overeat and refuse to scratch in the litter for the whole grain, so they do not get the warmth and exercise during the fore part of the day, and produce fewer eggs than when they have access to the dry mash in the hoppers.

To derive maximum returns from any ration it is important that the hens have pure water and an abundant supply of grit, shells and some kind of succulent food. Cabbages, mangels, carrots and small potatoes may safely be fed in limited amounts, but too heavy feeding may cause an undesirable laxative condition of the bowels and do more harm than good. Special foods, condiments and stimulants are not neeedd by healthy, well-fed hens. Such dopes simply result in adding to the cost of the ration without doing any permanent good. Studying the principles of economical feeding and adopting methods suited to one's own conditions will give the best returns at a minimum cost for feedstuffs and labor.—W. M. K. in an American exchange.

POULTRY SUCCESS

It pays to band the hens that are to be held over for breeders so that the next year they can be distinguished from the pullets. Otherwise good pullets may be marketed for old hens and some of the old hens may be retained for a year longer than it is profitable to keep them on the farm.

If you are raising pure-bred poultry and have a surplus to sell in the fall, do not market them hastily with the local butcher, but find out if the neighbors need good foundation stock of your particular breed. Very frequently many of the year-old hens can be sold as breeders near home at a price twice as high as they will bring on the market. A sign by the side of the road will be profitable. If there is a large flock to sell, advertising in local papers and farm journals will be profitable. When developing a poultry business it pays to study the local demands and supply them whenever it is possible.

A price of $10 is not too much to pay for a cockerel of a fine exhibition or bred-to-lay strain. The farmer who makes such a purchase is not only buying one bird but all the skill that the breeder has used in producing it, and also all of the improvement which can be made in the home flock during the next two or three years.

Farmers buying fine cockerels for breeding purposes should strive to save the best of the year-old hens to use in the next spring's matings. Too much emphasis cannot be placed on the value of a good male but at the same time it is the hens that lay the eggs and they should be vigorous birds of excellent producing ability. It hardly pays to buy a good cockerel and use it with hens lacking in vigor. It is so much better to give the male the best possible chance to produce good results and thus it is necessary to use care in selecting the hens.

The feeding of poultry has a good deal to do with their general health and with the production of the number of eggs a hen may lay in a season, but it has no great control over the size of the eggs. Sometimes the first egg of the clutch or the last one is a diminutive or deformed egg, but all the eggs being small is very likely due to the variety of hens you have in your flock. There are strains and varieties of hens that lay smaller eggs than others. Minorcas lay very large eggs, while the Hamburgs and some strains of Wyandottes lay small eggs. It is along the line of breeding that you will have to look before improvement in the size of the eggs is accomplished.

THE PARTNERSHIP

"IT'S all rot" angrily thought Phil Melvin, "the sentimental drivel talked about a fellow making himself count in the world in spite of physical handicap!"

In an endeavor to ease his cramped leg as he sat in the auto impatiently waiting for the interurban electric he stamped his foot against one of his crutches and although he paid for it by a twinge of pain twisting up his spine he had the satisfaction of giving the crutch a vigorous kick.

Of course he did not regret going into the war. He would have gladly laid down his life for his country. It would have been a darned sight easier thans this! "Not even to be able to run your own machine," he muttered to himself, glaring at his chauffer's broad, straight back. "To be hauled to the station every morning like a baby in a go-cart! To be stared at on the train—pitied! To have the fellows at the office so infernally nice to you that it was all you could do to keep from punching their heads and——"

"Morning paper, sir?" a shrill, small voice cut brightly into his morose brooding.

Melvin looked up scowling, but instead of the grim shake of the head purposed, he stretched out a hand. "Yes," he said with intentional gruffness, for the newsboy was a hunchback—and a cripple at that, since he propelled himself in a kind of tricycle—and Melvin was not going to insult him by any coddling tone. In fact he went so far as to resist the impulse to tell him to keep the change.

At that moment the interurban appeared and everything else was forgotten in the difficulty and embarrassment of getting out of the machine and into the train.

This can't go on indefinitely," he determined as he dropped exhausted into a seat. "I know how fond of the place mater is, and now poor old Judy and her kiddies have come home to live, I suppose the whole family will be up in arms at the idea of selling and moving to the city. But I've got to be considered, and I'll not stand for it—either commuting or making a spectacle of myself at a boarding house or in a hotel's public dining room."

That evening when he broached the subject—in a rather imperious way, it must be confessed—instead of the family being up in arms he met with ready acquiesence.

"Of course, Phil, anything you want," said Mrs. Melvin, with tremulous eagerness. "Judy and I had already wondered if it would not be better for us to live in the city, but better for us to live in the city, but hesitated about porposing it, not knowing how you'd feel about making the change."

"I thought Judy would be against it on the kiddies' account," he said rather surlily.

"There is no place like the country for little folks, especially in the case of a child not quite strong like Toots, but your comfort must be considered first, dear boy."

So he won his point and a new grievance to brood darkly over the next morning while waiting for his train.

To think of a whole family being made miserable for a worthless piece of junk like him! The mater and Judy put up a good bluff, but they didn't fool him one little bit. Hadn't he heard his mother say she loved every rosebush on the place, every leaf on the trees? Didn't Judy tell him with tears in her eyes what a sweet comfort it was to in the old home with all its happy girlhood associations after the distress and disaster of her married life?

"A morning paper, sir?" interrupted a familiar voice.

"I don't know whether I want it or not," said Melvin indifferently as he took a magazine thrust at him, and turned over a page or two. "Is it a good number?"

"Sure, a swell one," and the urchin ingratiatingly ran over a string of contributors' names.

The man in the machine put his hand in his pocket for the required coin, and his train being late, he began to question the boy. The clear-cut answers of the youngster in the tricycle, his original remarks, his fund of general information, was a distinct surprise, and all the way to town things the little hunchback had said kept recurring to Philip Melvin's mind.

Of course the newsboy appeared the next morning, and the next, and the next.

And, partly for his own amusement, partly to test the youngster's business ability to "put it over," Melvin always began with a stubborn resistance to all arguments until the last moment of the train coming into sight.

"I believe you sit up nights, kid, scheming how to buffalo me into buyink what I don't want?" he remarked laughingly one morning when the little fellow had really persuaded him to take a magazine he was prejudiced aginst.

And a smile of amusement lingered on Melvin's face after he had boarded his train. If anyone had told him he could smile while going through that ordeal he would not have believed them.

So their daily talk and their daily sparring became an established habit, and when ten days later a heavy rain began to fall just as Melvin was leaving the house the thought that he would miss seeing his young friend was a distinct disappointment. In fact, as he rode to the station he was in one of his darkest moods. It was trying enough getting down the porch steps into the machine when the sun shone, but to manage his crutches in the slippery wet was a nerve racking undertaking. And when Judy had proposed holding an umbrelal over him he had given her such a black look she had not dared to insist and the pelting drops had trickled down his neck. He'd not stand for it any longer. Even if they couldn't sell or rent the place they would have to pull up stakes anwhow and move into town by the first of the month.

"Morning paper!" shrilled a small voice across the wet pavement. "Latest number of——'

"For the love of Mike!" exclaimed Melvin in astonishment as he spied a small, huddled figure enveloped in slickers, a waterproof covered bundle under his arm. "I never expected to see you on deck a morning like this."

'What do you take me fore?" indignantly retorted the little hunchback, for the first time an angry flash in his eyes. "A mollycoddle!"

And all the way into town the contemptuous word, "mollycoddle," kept slapping Melvin's thoughts in the ace. From the nervous tension in the air on his return that evening he knew that something had happened during the day.

"Well, dear, you can begin to pack your suitcase," said his mother with forced gayety, as they sat down to dinner. "At last we have an offer for the house."

It was considerably less than what she had asked, she went on to explain but she and Judy had talked it over, and under the circumstances they thought the terms offered would better be accepted. "For now bad weather has started in," she concluded, "you simply can't commute."

"Great Scott, mater!" exploded Melvin. "A man doesn't mind a little rain! Don't you budge from your original price."

The spirit of mortal may be contemptuous of weather, but the flesh is none the less suceptible to exposure, and the day after the drenching rain, instead of the shrill small voice piping its wares, a hoarse little croak greeted Melvin's auto as it drew up at the curb.

"It ain't nothing," the little hunchback scornfully tossed aside Melvin's solicitude. "I only sound bad 'cause it's settled in my pipes. Gee," he grinned, "you ought to have heard the graveyard cough I had last winter!"

And all the way into town that morning Phil Melvin sat lost in thought—planning scheming.

"Say Bud," he accosted the newsboy the following Saturday, "if I come home on an early train today do you think you could manage to get off to take a little ride with me? I've something I want to talk over."

"Oh, I don't know but I could!" said the youngster, trying to keep the excitement from his voice.

"Very well, look out for me then. I'll be on the 3.10."

So through the flame and gold beauty of the autumn world they rode side by side the big cripple and the little cripple, handicapped brothers fighting the same fight with the same odds against them.

"I've a proposition to make," Melvin was saying. "How would you like me to set you up in a regular newsstand? I'd see to getting the necessary permit you know, foot the bills and all the rest of it."

There followed a silence of deep thought—on the little cripple's face the outward and visible sign of a conflict within.

"Well?" said Melvin, a little impatiently.

"I'd like it fine," beamed the boy, "under one condition.'

"What's that, Bud?"

"That the whole thing is done on a business basis," he answered soberly. "That you and me go into partnership, I meant. I'm an A No. 1 salesman, all right," he continued in an eager rush of words, "and if I had capital—if you'd put up the tin, and take your share of the profits, so there wouldn't be any 'object of charity' about it—say, together we could make things hum!"

This time the silence was on Melvin's part. Then he put out his hand. "It's a go, Bud. Shake."

A week later the party wishing to buy their place came up to his mother's price.

"Do you and Judy really want to live in the ctiy, mater?" scowled Melvin.

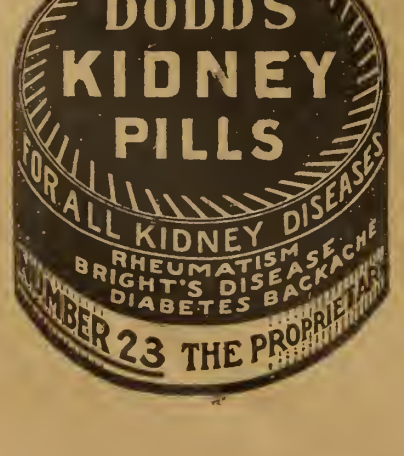
"I told you in the beginning, dear, how willing we were."

"Being willing and wanting to are very different states of mind, mater, and unless you prefer the city I'd much rather go on as we are."

"But, Phil, I thought——"

"Oh, I know I fussed a lot about going and coming on the train, but now I've got the hang of my crutches I can manage well enough. Besides," he added with a long lost twinkle returned to his smile, "I've business interests here that I must keep an eye on."

The next morning on the way to his train, as the auto approached a certain active corner, he gave a



Do Not Neglect The Bad Cold OF TO-DAY

IT MAY BE SERIOUS TO-MORROW

May Develop into Bronchitis, Pneumonia and perhaps Consumption.

Miss Mary Prouse, R.R. No. 1, Cedardale, Ont., writes:—"I had the Influenza in November last, and it left me with a terrible cough. I did not attend to it until it got so severe people warned me it was time to see about it. I went to the doctor and got some medicine. He told me it was a bad attack of bronchitis. I could not sleep, and would have to sit up nearly all night, it was so difficult for me to get my breath. The doctor's medicine did not seem to be helping me the least bit.

One of our neighbors came in one day, and told me about Dr. Wood's Norway Pine Syrup. I tried it and took two bottles. No person could believe how it helped me. I have recommended it to different people since, for I believe I have reasons for doing so.

Dr. Wood's Norway Pine Syrup has been on the market for the past 30 years, and stands out by itself as a remedy for all coughs and colds.

Be sure and get the real "Dr. Wood's" when you ask for it. Put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

playful tap on the broad, straight back of his chauffer. "Stop a minute, Brent; I want to look at something," he said.

Leaning out of the auto, Phil Melvin critically inspected the fresh paint on a most imposing newsstand in the form of a snugly roofed-in six sided little booth, with heavy paned windows to shut against wind and rain.

Suddenly he threw back his head and laughed his old boyish laugh, for his glance had lighted upon the following carefully printed sign conspicuously fastened on the front of the news stand:

RESTORING OLD FURNITURE

A little knowledge of staining painting and varnishing is of great value to the housewife who loves a pretty home and wants to make the most of what she already possesses. The woman who once possesses this knack need no longer put up with shabby furniture for it is easily within her own power to make it look almost as fresh as the day in which it came from the factory, or, in the case of a very old piece, remove dents and scratches and give it a finish that will will make it admired of all beholders.

Suppose for example, there is an old sofa in the living room to comfortable to discard, but which is year by year growing shabbier. It was once covered with dark repp, but this is now so faded and streaked that it is hard to tell pust what was the original shade, and the woodwork is so dull and scratcher that one has to guess what sort af tree it came from. To have such a piece "done over" by a professional upholsterer is inconvenient for people living in the country, for they are usually many miles from any shop of the kind and besides this the expense of the work is very considerable. But there is no reason why any clever housewife should not do it herself, for it is no more difficult and perhaps not so much so, as many things she does every day as a matter of course. If one knows just how to go about it, the difficulties decrease surprisingly.

RemovingOld Covering

The first thing to do to an old piece of furniture is to remove the cover which is in too poor condition to save. In looking at it closely you will see that the repp is tacked in place with fine upholstery nails with small inconscpicuous heads. Remove these with a small tack drawer or a sharp chisel being careful not to mark the wood any more than is necessary. in taking off the old cover do not tear it into strips for you will need to use it as a pattern for the new one you are going to put on. Under the first cover there is usually another coarse, unbleached cotton cloth to protect the stuffing of the springs. If these things are in good condition the under cover can be left alone and simply brushed off with a stiff brush and then wiped with a damp cloth dipped in ammonia and water to gather all the loose dust. But if, as is usually the case, the stuffing is matted into lumps and some of the springs are broken, this cover also should be removed, for while you are about it the repairs should be thorough. This can in most cases be taken off in such large pieces that it can be washed and then put back again, when the repairs to the interior are completed.

If the curled hair with which the sofa is stuffed is filled with dust and matted together, take it out of the sofa and pick it over on a big sheet, tossing the hair about and working it apart with the hands until it is clean and nearly twice the former bulk. If any of the springs are broken, have them replaced for a broken spring will cut through the cover and spoil all your repairs. You can get springs at any furniture store or where upholstery is done or your nearest storekeeper can send to the city and get them for you. You may have to buy an entire new set as the springs in the sofa are perhaps so archaic that they are no longer made. But even if this is the case, the cost will not be very great. Before removing even the broken springs examine carefully the manner in which they are put in, especially the way they are held in place by the broad strips of webbing that are usually used for this purpose. If this is frayed and worn, get new webbing at the same place you buy the springs. As a precaution do not take the old webbing out or remove more than one o the springs before you have the new ones at hand and are ready to begin repairs. In this way you cannot forget the prover method of putting them in again. When the webbing is renewed, the springs back in their places, the hair returned to its original hiding place, put on the cotton cover again, or if one was not user, make a new one. This will cost very little, is easily put on as it is entirely concealed, and protects the stuffing and springs from dust and will make the cover wear twice as long.

Painting and Varnishing

Now is the time to give a little attention to the dull old woodwork. The first thing to do is to remove the dust of ages and the ancient coats of varnish. This can be sandpapered off but as this is quite a laborious process, it is much easier and quicker to use one of the excellent varnish removers now on the market. You can get this at any paint shop in your nearest town or at most urniture stores. Apply to the wood with an ordinary paint brush and leave until the varnish becomes soft. Then remove with a putty knife or a fiat bladed kitchen knife. Wipe over the surface with an old cloth dipped in benzine. Should this not make a perfectly clean surface rub with a rag dipped in the remover and wipe off again with benzine. Mouldings, beadings and all ornamental work apply in exactly the sam wey, but in order to clean the crevices thoroughly use a stiff brush dipped in benzine for last cleaning. Sometimes in a very old piece of furniture the varnish is so hard and thick that it is necessary after the first coat of remover has been put on and the loose material scraped off with a knife to apply a second coat and let this remain on until all the old varnish has been softened.

With the removal of the varnish all the scratches have disappeared

The Best Washer You Ever Met!

Never gets tired or cross! Never "skimps." Handles light or heavy goods—blankets or tear the most delicate fabrics, and only takes half the time! Isn't that the kind of a washer to have in your home? Then go to your dealer's to-day and meet the—

End Your Suffering!

Each year thousands of people throughout Canada put an end to their sufferings by the prompt use of Gin Pills. It is estimated that in the Dominion alone one out of every fifteen people annually use and derive the greatest benefit from these wonderful pills.

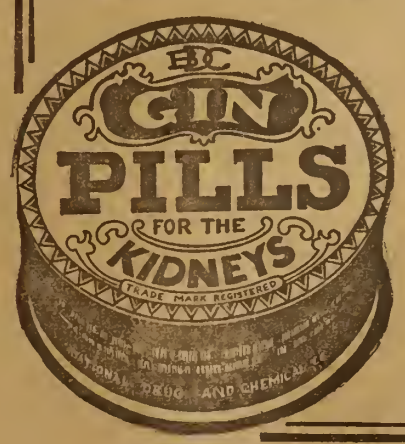
Prepared with the greatest care and thought from a formula that was only achieved after profound study and patient experimenting.

Gin Pills FOR THE KIDNEYS

have done more to relieve pain and prevent serious Kidney and Bladder Troubles than perhaps any other preparation that can be obtained.

Mr. Frank Ide, a pullman conductor, suffered intensely from pains in the groins, sore back and very severely from gravel and sediment. After taking Gin Pills Mr. Ide wrote us. "The pain left me entirely. I have no trouble whatever in urinating and I feel as well as I ever did in my life. I recommend Gin Pills to everybody in any way troubled with kidneys or bladder."

Mrs. Percy, Halifax, N.S., after trying a sample sent for six boxes. She wrote:—"Before I finished the third box I found myself for the first time in years free from pain—the pains did not return. I wish everyone who suffers from backache and kidney trouble would use Gin Pills. They are great,"



If you suffer with pains in the groins or back, Rheumatism, swollen ankles, stiff joints, gravel, constant headache and lassitude, constipation and dizziness, take Gin Pills and nip the trouble in the bud.

Send for free sample or get a box from your druggist or dealer, 50c with money-back guarantee.

Hot Flushes, Fainting Spells.

So Weak and Nervous Could Not Sleep.

Mrs. Philip H. Ryan, Sand Point, N.S., writes:—"I have been a great sufferer from nerve trouble. I was so weak and nervous I could not sleep at night, and my appetite was very poor. I could not walk across the floor without trembling all over. I had hot flushes and fainting spells. When I was on my second box of Milburn's Heart and Nerve Pills I began to feel better and kept on until I had used six boxes when I felt like a different person. I am never without them in the house and recommend them to all who suffer with their nerves."

Milburn's Heart and Nerve Pills are 50c. per box at all druggists or dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

but there may be some dents in the wood still in evidence. These can be made much less noticeable by steaming. The easiest way to do this is to take a small piece of old flannel, wet it thoroughly, put it over the dent, and then hold a hot iron on it until it is dry. Wet the cloth again and agan applying the iron until the wood has swelled enough to make the dent disappear. After the wood has dried out thoroughly rub it over with stndpaper to make a smooth surface. Have ready a can of good furniture varnish and with a small brush apply a coat putting it on smoothly but not thickly. Let this stand for a day and a night and then rub lightly over with sandpaper and put on your last coat of varnish. Your wood work should now look in first class condition.

Cutting New Covers

The next operation is to carefully cut out your new furniture cover the exact size of the old one, but remember to allow for half to a quarter of an inch all round for turning under at the edges unless the material chosen is very stout and thick when it can be put on with raw edges. This should be tacked in place with new upholstery tacks or small upholstery nails. Pull it rather tightly in putting it on but if there is a pattern of stripe be careful to get it on straight. Then tack all around the edges an upholstery gimp to match or harmonize with the covering. This makes a very neat and attractive finish. Your old sofa should be literally as good as new and equal to ten or twenty years more wear. For covering large pieces of this sort, tapestry, corduroy or cretonne with a dark ground are used.

In the case of old furniture where the covers are not torn or very much worn but only rather dingy looking, or perhaps a little faded, they can be greatly improved by brushing off carefully with a whisk broom, and then wringing a cloth out of warm water and twisting nearly dry, laying this over the cover and beating it with a rattan furniture beater. When one side is dusty, turn it on the other. Often it is necessary to use several cloths on one piece of furniture. Continue beating until the cloth comes away without showing any soil. If the furniture coverings are not in a light color ammonia can be put in the water in which the cloths are wrung out. This will still further brighten the cvering. Do not let the cloths be very wet or you will streak the upholstering. They should be damp only. Sometimes a last wiping with a cloth dipped in alcohol aids greatly in the cleaning.

Best Medicine He Has Ever Taken

FATHER TELLS OF SON'S HELP FROM DODD'S MEDICINES

He Recommends Everybody Who Has Shaking or Pain in the Heart to Use Dodd's Dyspepsia Tablets and Dodd's Kidney Pills.

Birmingham, Sask., May 25th. (Special)—"Dodd's Kidney Pills and Dodd's Dyspepsia Tablets are the best medicines my son has ever taken."

This is the statement of Mr. Johannes Reinson, a well-known resident there. "When he started to take them," Mr. Reinson continues, 'there was not much hope for him. Soon after starting to take the Dodd's Medicines he began to improve in health and now he is well."

He advises everybody who has shaking or pain in the heart to use Dodd's Kidney Pills and Dodd's Dyspepsia Tablets.

The Dodd's medicines act on the two essentials to good health. The Tablets help to digest the food and produce good blood. The Pills act on the kidneys, healing and strengthening them, thus ensuring that the blood is kept free from impurities. For the work of healthy kidneys is to strain all impurities out of the blood.

Ask your neighbors if Dodd's Kidney Pills do not heal and strengthen the kidneys.

CARE OF CHILDREN'S TEETH

Busy mother, have you taught your children to use their tooth brush and to care for their teeth by brushing them regularly? The teeth should be properly cared for from babyhood. Mothers are very careful to wash the infant's mouth with a boric-acid solution; we do this to prevent sour mouth, etc. To cleanse the mouth means less ills for the infant. If this is necessary to preserve health of the infant, why not continue the washing and cleansing after the teeth come and the child begins to eat solid food?

The soundness and symmetry of the second teeth depends in a measure upon the care given to the first set. If we are careless and allow the first set to become decayed, we cannot expect the second or permanent ones to remain sound for very long. The permanent teeth are forming behind the roots of the first ones and decay in the first cannot but cause decay in the second.

Have the first teeth well taken care of while they stay. It is necessary that they be filled at the first signs of decay. No child can properly masticate food if the teeth are badly decayed or the gums irritated. If the food is not properly masticated, the juices of the stomach cannot carry on the work of digestion properly. The child may eat plenty of nourishing food and yet not derive the benefit from it.

Some dentists recommend leaving first teeth in place until the new ones coming cause the first ones to loosen when they can easily be removed. Others say, remove the first ones early so that the second ones may not be crowded. A visit to a reliable dentist every six months or so after the child has passed his third year will determine the position of the first teeth in regard to the second and upon his advice the first ones can be removed in time to allow the second ones to develop properly.

Cavities in the teeth are ideal breeding places for many kinds of germs. It is said that an ulcerated tooth will cause rheumatism through the blood. The pus from it, getting into the stomach, may cause many other serious diseases. Decayed teeth may harbor the dreaded tuberculosis germs and these may find their way to the glands of the neck and cause tubercular glands. Many of the sanitariums for the treatment of tuberculosis will not admit a patient who has decayed teeth. He must first visit a dentist and have his teeth put in good condition before the attending physician will admit him for treatment.

The schools have taken up the question of decayed teeth and children are now receiving the instruction and care their mothers failed to give them. It is estimated that from fifty to ninety per cent. of the children in the public schools have decayed teeth. Decayed teeth interfere with their health and therefore with the brain. No child can do his work well if he has a toothache, or a rough tooth which jags his cheek or tongue.

Teach the child the use of the tooth brush arly in life, also tell him the injurious effect of bad teeth upon his whole system. The child of two years can, with a little patience, be taught to use the tooth brush and it will soon become a fixed habit with him. It takes but a few minutes' time after each meal and often saves a world of trouble later on. Get him a brush in which the bristles are solid but not too stiff. A cheap brush is expensive at any price, it will not cleanse the teeth properly and the bristles are continually coming out, often lodging between the teeth, or under the gums, causing irritation and annoyance. See that he uses the rotary motion, so that the bristles of the brush may remove all particles of food lodged between the teeth.

The quality of the teeth greatly depends upon the food eaten. Soft foods that do not require much mastication will produce soft, crumbly teeth. The little teeth need exercise as well as the proper nourishment, so let us provide "zwieback" or twice baked bread, graham crackers or the educator cracker. These require thorough mastication, thus providing exercise which increases the blood supply to the teeth. Nourishing foods, such as well-cooked cereals, eggs, milk, bread and butter, fruit and vegetables and boiled meat should be given. Corn meal, used in "Johnny cake," gems or "mush" is beneficial. Spinach is especially good on account of the iron it contains.

See to it that your children clean their teeth regularly. Coax them if you can; force them if you must. Sound teeth can only be retained through eternal vigilance. Dentists tell us that a greater number of people neglect their teeth in rural districts than in towns or cities. Are we so careless of our health and personal appearance that we neglect anything so vital as the care of our teeth or is it that the dentist is so far away that we ruralists have earned this reputation? Dentists are not so hard to reach that we excuse our neglect in this way. Personally, I think we can excuse ourselves through that little word "busy" but that does not repair our decayed teeth or our injuured health. Let us visit the dentist regularly, and see that the children's teeth are taken care of regardless of how busy we may be.

HONEY—THE FARM SUGAR

Honey Biscuits—Put ½lb. flour in a bowl, add two ounces of sugar, ¾ ounce of chopped almonds, one egg, one and one half tablespoonfuls of honey, and one half ounce of candied lemon peel chopped. Beat well and add a pinch of carbonate of soda. Turn onto a board that has been sprinkled with flour, roll thin, and cut in rounds. Bake in a moderate oven. About three fourths pound of biscuits.

Hard Honey Cake—Sift 2½ cups of flour, pinch of ginger and cloves, one teaspoonful of cinnamon; dissolve one-half teaspoonful of soda in one tablespoonful of water, baet one egg and combine the ingredients. Add three fourths cup of honey, one half cup of sugar, pinch of salt, one-half teaspoonful ground cardamon seed, a few blanched almonds, a few raisins. Beat the mixture well. Roll out the dough to thickness of three fourths of

an inch, bake in a hot oven. Very delicious.

Bran Honey Muffins—One-half cup ful of honey, one cupful of flour, one-half teaspoonful of soda, one-ourth teaspoonful of salt, two cupfuls bran one tablespoonful melted fat, one and one-half cupsful milk, three-fourths cupful of finely chopped English walnuts, one teaspoonfuul baking powder and soda. Mix them with bran. Add other ingredients. Bake 30 minutes in hot oven in gem tins.

Honey Pudding—Place four ounces of honey in a bowl with four ounces stale cake or bread crumbs, stir with a wooden spoon three minutes, then add two ounces of rice flour, grated rind of a lemon, half teaspoonful of ground ginger, one gill milk, one ounce of buutter, the yolks of three eggs, and mix for five minutes. Beat up the whites of three eggs to a stiff froth, add to mixture and mix with the skimmer for a minute. Pour the preparation into a lightly buttered pudding dish, set in oven and bake 15 minutes; remove, unmold on a dish, and serve with a sauce.

Honey Rolls—Dissolve a yeast cake in a cupful of warm scalded milk, add a quarter of a pound of butter, a tablespoonful of sugar, and half of a teaspoonful of salt, and let them dissolve in the warm milk. Stir in a well beaten egg, and three cupfuls flour. The milk must not be too warm when the yeast cake is dissolved in it. Let the batter rise, knead and roll it out into thickness of about half an inch, spread with a mixture made of half pound walnuts chopped fine, quarter pound of raisins, chopped fine, and a cupful of honey. Form them into rolls let rise and bake in a moderate oven.

Honey Filling for Layer Cake—Blend together one-half cupful each of honey and of sugar, with two tablespoonfdls of water. Heat over the fire until it forms a thread; remove and beat in the stiffly whipped white of an egg. Beat constantly until the mixture cools and is soft and thick, like cream. Spread between layers of cake and frost the top.

Honey Ice Cream—One quart milk three-fourths cupful strained honey, two eggs and one egg yolk saved from frosting. Scald the milk. Beat eggs slightly, add the honey and pour the scalded milk slowly over mixture. Cook in a double boiler over boiling water until the custard thickens and coats the spoon. It should be stirred constantly while cooking. Cool and freeze.

NOTHING BETTER THAN BUTTER

Good for Growing Child

Thousands of years ago when the world was very new and people lived mostly out of doors and slept in trees caves and rudely constructed shelters, butter, milk and cheese were the principal foods.

The lives that these people led were hard and rough and in everything that they did, they were guided almost entirely by instinct. So, even had they been told of the wonderful nourishment contained in these simple dairy products, they would not have understood what it was all about. But instinct told them when and what to eat, and they knew when they ate butter, milk and cheese that their hunger was soon satisfied, and that their tired bodies were quickly refreshed. So, in this manner, they became healthy and vigorous men and women and lived to be very old.

For centuries, butter, milk and cheese have been closely allied with the mental and physical development of the human race, and at the present time. in all countries where they are used generously in feeding the young, we find the finest, strongest, most intelligent and useful people.

There is nothing healthier and better as a food for the growing child than plenty of good bread and butter

When, after hours of study and on the playground, you run home to mother for something to eat, ask her for a slice of bread with rich, golden butter spread thick all over it. Then, very soon you will feel as good as new, and that is because butter replaces the energy that has been consumed in work and play.

Mother knows just how much good those slices of bread and sweet, rich butter means to her little boys and girls and gives them gladly all that they want, because, above everything else she wishes them to have healthy minds and bodies, so that they may perform their full duty as good citizens in years to come.

To eat plenty of good butter is the surest means of keeping your supply of energy at its best, and energy is of utmost importance to both body and mind.

Additional energy also is gained from the soups, meats, vegetables, bread, pies, cakes and puddings that you eat when butter is used in preparing them. Butter makes them more palatable, too, and more digestible.

Nearly everything contained in butter is good for your body, 80 percent. of it produces warmth and energy, 1 percent. is protein that renews the wasted tissues, and 3 percent. is mineral matter that repairs and strengthens the bones. Butter also is good for you because it contains a vital substance known as vitamines, that is necessary to the development of your body, and which other vegetables and animal fats do not possess Butter is valuable as a food because it is easy to digest and is quickly at work, helping to make you bigger and stronger.

Your body needs a great deal of good foods like butter and milk because, if healthy, the body of a child develops rapidly and is very active, so that every day there is a large amount of new tissue and energy to be supplied.

Every time that you recite your lessons, romp around the playground or help with the work at home, a certain amount of muscle and energy is used up and must be restored. Even every heart beat or breath taken destroys some part of our bodies so that they are in need of constant repair.

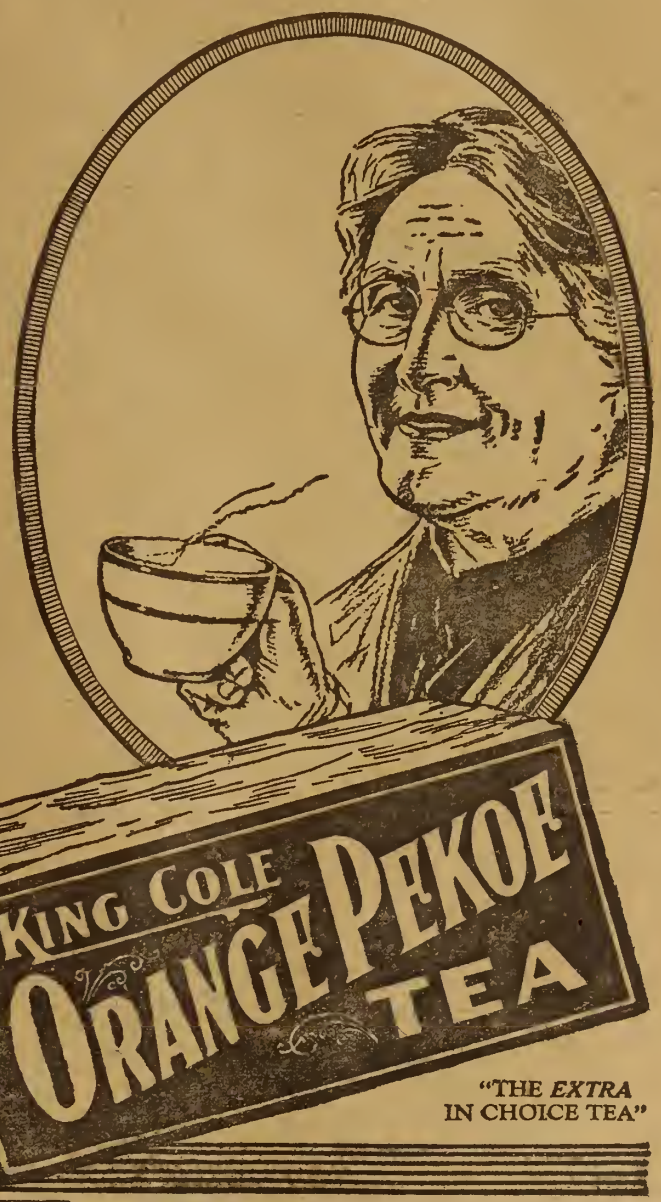
When a man builds a chimney, he uses brick and mortar or cement, so that it may be strong and durable and safe, he would not think of making it with boards. And it is the same with you. Your own body needs certain materials to make it grow and to maintain the proper amount of energy and strength.

Butter is one of the most perfect foods that can be used for this purpose and in bringing out the very best there is in you in mental and bodily strength.

A New Character

When, four years ago, KING COLE ORANGE PEKOE TEA first appeared, something more than a *new tea* had been produced—a *new character* in tea had been created. Only after most searching experiments in flavor-blending were we at last able to develop that *peculiarly mellow richness of flavor* so delightful to the taste, which has won for KING COLE ORANGE PEKOE the high place it holds. The total annual sale of KING COLE ORANGE PEKOE has *doubled twice* in the last two years.

We are confident that you will say that it is *different* to any tea you ever tasted.



"THE *EXTRA* IN CHOICE TEA"

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Write for free trial treatment.

CENTRAL PRINCIPLES OF WEED CONTROL

(Continued from page 625)

hold in hay land or pastures that are left unbroken for a long time. The best method of eradication is to break up the field, put in a cultivated crop if possible and seed down in grain the following year. Where this weed is bad land should not be left in grass longer than two years. The same applies to land infested with ox eye daisy or Bulls eye.

Couch Grass.—This is a perennial weed that is quite difficult to control because of its creeping roots. By careful work it can frequently be smothered out with a crop such as buckwheat. Where a field is badly infested it would be advisable to plough in early fall and work ground with a cultivator and remove roots. Plough shallow again in Spring and work the land frequently until time for sowing buckwheat cultivating as much as possible during hot dry weather ,remove all roots and sow buckwheat when there is sufficient moisture in soil so that it will come up quickly and cover the ground. Couch grass has frequently been killed in one occasion by the above treatment. To insure success with this treatment, it is very necessary to cultivate land, beginning early in spring and cultivating often during early summer before buckwheat is sown. The object being to keep the wood from getting above ground. The roots are thus weakened and are smothered out by the buckwheat crop.

ST. JOHN EXHIBITION SEPTEMBER 4 TO 11

The St. John Exhibition Association is again going to hold a show and has fixed its dates at September 4th to 11th inclusive. This will be the first Exhibition to be held in St. John since 1914 as the Exhibition plant has, for the last five years been employed for Military purposes. The Militia Department have just handed back the plant, and have also paid over a substantial amount to offset the damage done by their occupation, so that the Association is in a position to expend more money than is usually the case, and therefore expects to make this year's show a distinct success in every way. In addition to some splendid free acts in front of the Grand Stand, contracts have been entered into that will make the Midway a more elaborate affair than ever. These contracts include some seven riding devices and about fifteen big tent shows; in fact, the Midway will, this year, resemble a first class Summer Carnival rather than the fakir's row of former years.

MANGEL GROWING

The growing of mangels has received a great impetus in many districts owing to the serious loss among turnips, caused by club-roots. The mangel is attacked by very few insects or diseases and when successfully grown produces immense yields of succulent food so necessary for live stock during the winter and spring months.

Sound, fresh, plump seed should be secured and large quantities of the very best home grown seed is now on the market. The mangel requires plenty of moisture and should be planted in good well tilled land early in the season. It works in very well with the following five year rotation: Barley or Mixed grain, Mangels, Grain seeded out to clover and grasses, Hay, Pasture. About one half of the manure (12½ tons) is applied to the barley stubble and plowed under in the autumn; the balance (12½ tons) is worked into the land as soon as it is fit to work in the spring. When the land has been worked so that it is mellow and friable it is thrown up into low drills 30 inches apart and the tops of these dragged off with a pole or fence rail. The seed is then sown about 1½ inches deep, at from 4 to 6 lbs. per acre, according to the quality of the seed. The "Planet Jr." cultivator and seeder is a very satisfactory implement for this work. This is followed by a heavy roller firming the earth about the seed, so that it may get sufficient moisture for germination. During the dry period it is well to seed in the evening so that the earth may remain damp about the seed for a longer time. The most important point in getting a good catch is to have the seed deep enough so that it will not dry out, and to have the soil pressed firmly about the seed. It pays to take extra time and trouble to put the seed in right, even if it is necessary to make a trench with a hoe for the seed and to cover and pack the earth down with the feet.

As soon as the plants are up in rows they should be edged with a hoe or hand cultivator. The latter will straddle the row and do both sides at once. The horse cultivator should then be run through the rows every week or after every heavy rain until the tops cover the ground. Thorough persistent cultivation will add greatly to the drop by conserving moisture and by destroying weeds. The plants should be thinned to about ten inches apart in the rows, by the time they get four leaves and hoed a second time before the roots swell.

Mangels should be harvested before severe frosts occur. They should not be topped so close that they will bleed, asd should be handled carefully if they are to be stored for a long period. They should receive plenty of ventilation when in storage, because like all other roots they are alive and require air. The "Yellow Intermediate" is easily harvested. It is one of the best yielders and contains a large percentage of dry matter.

Dominion Experimental Farm,
Charlottetown.

MANURE A PERISHABLE PRODUCT

Manure is a perishable product. It begins to give up its fertility elements almost as soon as it is voided. Between this time and that uncertain moment when the fertility elements which it contains are assimilated by the tiny root hairs of growing plants, very many factors enter into the problem of conserving these elements for soil enrichment. It has required long years of patient study and an untold amount of experimentation to reveal the workings of Nature as these take place with a heap of unsightly stable waste. And because these changes, so far as one's vision is concerned, do not result in a very marked transformation of the wastes in question, it has been hard for many persons to believe that much of what has been preached to them concerning the conservation of manurial waste, has been anything mre than the fanciful dreaming of high-browed professors or the mental gymnastics of farmers of the text book variety.

Agricultural economy, however, must keep a check on every stage in the handling of the manure crop if the fertility elements which thus are made available for use are to be utilized to the best possible ends. Because manure is a perishable product this oversight must begin in the stable and must not cease until the wastes are underground, where they can best give an account of the fertility which they contain. Roughly speaking, it is possible to divide these losses into three classes: First, those due to improper oversight or care; second, those due to chemical and bacterial actions occurring in the waste as it awaits distribution and incorporation in the soil; third, those due to poor administration in the matter of final disposition. As one scans the different divisions and sub-divisions it is possible to visualize the whole matter of fertility conservation at a glance. Furthermore, it can be easily understood why the handling of this perishable product is accompanied, even under reasonably good care, by a loss that must ordinarily approximate 20 per cent. No Man can expect to make the manurial wastes which he hanlles score 100 per cent. in the enrichment of his soil. But he must, indeed, be lacking in real thrift if his care and handling of these by-products reduce his score to 50 per cent. or below. There is no feature of the conservation of fertility elements in manure which is beyond the power of anyone to handle intelligently and wisely. But where this is not the case the fault is likely to be a matter of personal indifference rather than otherwise.

Many farmers pile the manure in the barnyard and clean it out thoroughly once a year, believing that they are doing an excellent work. Well, in one way they are, but the loss sustained by allowing the manure to pile up there is tremendous. In fact it has been estimated at as high as 41 per cent. on the average. The soil underneath the pile acts like a sponge and absorbs the fertility very rapidly. That waste could be prevented if a little care and thrift in the way of prompt removal of the manure to the fields were practised. Plant food is too expensive today to allow such a wholesale waste to continue.

The losses due to chemical and bacterial action, in most cases, are the re-

Massey-Harris

The Most Valuable Machine at Haying Time

THE Massey-Harris Combined Side Rake and Tedder is the most valuable machine the farmer can possess at haying time. It saves the cost of one machine, the extra storage space required, the time hitching and unhitching when changing from Tedding to Raking and it does better work.

It can be changed in an instant from Tedding to Raking or *vice-versa*, by simply pulling one lever, and satisfies the most exacting in either capacity,

The motion of the Teeth is easy but positive, their action being very similar to the work of hand rakes, handling the hay gently without beating or threshing.

Send for Special Hay Tool Folder.

MASSEY-HARRIS CO. Limited

AGENCIES EVERYWHERE

sult, also, of negligence. Rotting manure depreciates in value very rapidly. Three months' time will see manure lose approximately 25 or 30 per cent. of its total fertility. The best place for manure to rot is in the soil, for here as fast as disintegration takes place and the soil elemests go into watery solution they are taken up by the growing plant and utilized to the full extent. Where the rotting takes place in a heap of waste above ground, nitrogen gets away in the air while other products are leached out and lost by absorption through the earth or by drainage. The pile of unprotected waste, as it dries out and air takes the place of liquids, is subject to heating due to the action of bacteria which need the oxfgen in the air to enable them to thrive. Thus, whether the heap be wet or dry, the loss goes on unchecked. If the heap is protected from leaching by a shed or other covering, and if it is kept sufficiently moist to exclude the air, it will not lose much of anything in fertility while held in temporary storage. Surely there is nothing in such a simple precaution that is beyond the power of any really thrifty individual to achieve.

As for the losses enumerated in the third class, it might be better to say that they can be overcome by good farming practices. Good sense will dictate, as a rule, when and where it is best to spread manure. It also will recognize the superiority of machine sperading as against the old and wasteful method of hand spreading. Above all, good farming sense will recognize that the benefits to be derived from the most careful handling of manure up to the time it reaches the field may be quite overshadowed by poor administration in the final disposition of the wastes in question.

The conservation of fertility elements in barnyard manure is possible on every farm. Eliminate the exposed manure pile, distribute the waste promptly and understandingly to the waiting fields, and it will be found that though it is not possible to restore to the soil 100 per cent. of the fertility held in manure of this type, it yet remains possible to put 80 per cent. of it back into the crops of next year and the years to follow. And the man who puts back 80 per cent. of such manurial fertility into his soil can call himself a good farmer without fear of being a egotistical.

O. CROOKER.

MAKE SCALES TELL TRUE LOSS OR GAIN

Have you ever seen a groceryman or storekeeper dealing out supplies in loose form without weighing or measuring them in some form or other? Certainly not. If he were to do so he would not be in business very long before failure would overtake him. If you doubt that statement, just ask your local groceryman how he would like to get along without a weigh scale in his store. He will give you his opinion in very few words.

It is the same with the farmer, yet there are a great many farms where a weighscale is not a part of the equipment. That should not be, as it is next to impossible to sell farm produce intelligently without knowing the actual weight. Take for instance, the selling of a number of hogs or some beef animals; no man is such an expert judge of weight that he can tell exactly what they will weigh without a possibility of error. He may guess and come within a few pounds of their actual weight; but even at that what does the loss of anywhere from ten to fifty pounds on a number of hogs amount to? It may not seem much and must be considered very fair guessing on a pen of hogs, yet a shortage of that amount may mean a loss of anywhere up to $8.50, figuring at present prices. That in itself is worth considering, and it would go a long way towards defraying the expenses of a farm scale. It is the same with calves, sheep and even beef animals, to say nothing about the hay, grain, potatoes, grass seed, etc., that is sold off every farm annually.

Take another example, suppose you are selling one hundred bushels of oats at $1 per bushel and you sell it by measure. What happens? If the oats weigh 40 pounds to the bushel which is a very common occurrence, the loss in weight on one hundred bushels at $1 per bushel amounts to $11.75; surely that is worth considering.

A good farmer weigh scale is not overly expensive and when it is considered that it will last for years it cannot prove otherwise than a good investment. A few dollars saved each year will soon pay for it, and then there is the satisfaction of knowing that one is always getting what is coming to him which in itself is worth considerable. The purchase of a weigh scale for the farm is sound business, and it is hard to see how any farmer can afford to be without one.

BINDING CONCRETE

When necessary to discontinue concreting before forms are filled, as at the close of the day for instance, the top of the concrete last placed in the form should be roughened by scratching it with a stick to prepare for a good bond with fresh concrete that is to be placed the next day or when concreting is resumed. Immediately before resuming concreting, however, the surface of the old concrete should be well washed off and painted with a mixture of cement and water, mixed to the consistency of thick cream and applied just in advance of placing the fresh concrete.

Precious Hours and Dear Labor Saved With

LOUDEN

HAY TOOLS

HAYING is one of the heaviest jobs on the farm. Are you going to have the necessary labor to harvest the crop? Added to the labor scarcity is the uncertainty of the weather.

Hay which is cured and ready to haul into the barn loses much of its feeding value if it becomes wet.

Works Like A Giant

With a Louden Haying Outfit to work like a giant for you, you are not only enabled to reduce the labor of harvesting your crop, but you are relieved of much of the anxiety of being caught by catchy haying weather. It will enable you to get through your haying in one-half the usual time—with one-half the help—and with fewer horses.

Five to Seven Minutes

A Louden Sling Carrier Outfit will handle your biggest loads in from five to seven minutes. Lifting the load straight up from the wagon it is deposited well-spread and cross-wise of the mow, which makes mowing back easy. It does not matter how high your barn is, it can be filled to the peak with a Louden Outfit.

A Louden Outfit not only means less work for you, but may mean the saving of enough more good well-cured hay to pay for the whole outfit in one year.

Bound Grain Also Handled

Hay, Bound Grain, Straw or any other forage can be handled quickly and equally well. An all-year-round equipment is what you get when you use a Louden Sling Carrier Equipment.

If your barn is unsuited for a sling carrier equipment the next best thing is the Louden Senior Fork Carrier and Giant Grapple Fork. We are the Pioneers in the manufacture of Haying Tools and years of specialization well fits us to take care of your needs.

A man on the load—one in the mow or on the stack—and a boy at the hoist. That's all the help you need to run a Louden Sling or Hay Fork, a Louden Hay Carrier and a Louden Hoist.

PHRENOLOGY IN HORSE SELECTION

(Continued from page 637)

varies considerably in horses. The profile of some are straight, others are concave or hollow, while some are Roman in character or convex. For giving free passage to the nasal arrangement the straight profile is preferable, the contour being more pleasing than the very Roman profile, which some horsemen say it is a sign of a sour disposition.

Good quality is shown in thin lips. A narrow, small pinched mouth is characteristic of a poor feeder. A smooth, neat attachment of head to neck is also highly essential, a fullness at the throat and about the windpipe being undesirable.

The head shows the mental character of the horse and it is of much importance in the animal's usefulness to man. A good will or good disposition is the first quality required to obtain useful service, and a study of the head will generally reveal the tendency in the horse.

EXTRACTS FROM REPORTS

Toronto—Eggs—This market gradually weakened during the past week and closed with jobbing prices down 2 to 3c. Yesterday (Monday), the situation was steady with specials jobbing at 57-58c. candled current receipts 53-54c and twos 48c. A heavy increase in receipts is reported at country points, and trading during the papst week has been conducted on the basis of 46-48c paid to country stores and sales by country shippers at 48-50½ f.o.b. track. Some cars are reported on the way from the prairie provinces. The market has been influenced by Chicago prices and at their present level of 41c States eggs can be laid down Toronto at 50c. Storing is now general.

Poultry—Poultry receipts continue light and the market firm at unchanged prices.

Montreal—Eggs—Receipts for the week ending May 15th were 24,246 cases as compared with 21,770 cases for the previous week and 42,596 cases for the same week last year. This market was considerably easier last week and it is reported at Ontario country points that the trade are not very keen buyers at the present time. It is reported that the trade generally was surprised to find storage stocks on May 1st almost equal to those held a year ago. Yesterday (Monday) candled current receipts were jobbing at 54c and specials 57-58c. One sale of 1,000 cases was made yesterday at 54c.

Poultry—Some export business was reported last week, 825 cases of States eggs being shipped to Liverpool and 420 cases of Canadian to Glasgow. Poultry—Market firm under light receipts. One sale of 500 lbs. of turkeys reported at 55c.

Winnipeg.—Eggs—Dealers are now paying 43-44c delivered cases returned and jobbing current receipts at 46c. On the farmers' market Saturday specials were retailing at 58c. cuurrent receipts 53c. Carlot shipments continue but there is now a surplus which allows for some storing being done.

Poultry.—No change.

Regina, Saskatoon and Moose Jaw—Eggs.—Receipts are reported much heavier and quite a number are now going into storage. Dealers are paying country shippers 40-44c and current receipts are jobbing at 45c. Several cars have moved from Saskatchewan points east and west during the past week, the last car reported being one of firsts rolling to Vancouver costing 52½c f.o.b. Regina Poultry.—No business passing.

Edmonton—Eggs—The weather is reported warmer ans more spring-like but receipts continue light. The trade is offering 42c straight delivered, cases returnable, prices on a graded basis being: extras 57c, ones 44c, twos 38c. The jobbing business in small lots is reported small, most of the good eggs going into storage. Some business is passing in carlots of firsts at 52c. Poultry.—No business reported.

Calgary—Eggs—With better weather conditions receipts of eggs have materially improved and some surplus is now accumulating though considerably less than at this time last year. Packers are paying 44-45c and jobbing specials at $15.00 per case and firsts $13.50 per case. Poultry—No live poultry is arriving. The demand for the frozen stock continues steady.

Vancouver—Eggs—This market remains firm with 50-51c being paid for local fresh at country points, these jobbing at 56-57c. Arrivals from the prairie provinces are going into storage. A considerable quantity of States eggs are arriving by boat and express, these totalling last week, 1,570 cases. Poultry—Poultry receipts are increasing and prices are slightly easier, heavy live hens being quoted at 38-40c and dressed chicken 48-50c. A few live ducks are being sold at 75c per lb. live weight chiefly to the Chinese trade.

Maritime Provinces—Eggs—New Brunswicn country prices range from 40-45c with current receipts jobbing at 48c and retailing at 55c. Some were selling on the farmers' market Moncton, Saturday last at 50c. On Prince Edward Island prices have been slightly firmer during the past week and as high as 48c has been paid by country stores. Receipts show a slight increase over last week. The market will in all probability be slightly lower towards the end of the week.

Review of the Situation

Eggs.—Increased receipts and lower prices at Chicago have influenced the market in Eastern Canada during the past week and as a result prices are down two or three cents. Ontario country track shippers last week paid to stores 46-48c and report making sales f.o.b. track at 48-50½. Yesterday (Monday) 46-47c was being paid to country stores and the best offer reported was 48c f.o.b. track. Producers are receiving from 43-46c with Egg Circles obtaining a premium up to five cents above these prices. The market has also been somewhat influenced by the reports published of storage stocks on hand May first, particularly, in the case of Montreal when it was seen that the stocks this year almost equalled those of last year. As a result buying competition has not been so keen. Storing is now general and sales of storage packed extras were reported last week at 55-56 f.o.b. shipping point. The Chicago market is now down to 40½-41c and at these prices States eggs can be laid down Toronto at 50c.

The British Columbia market remains firm at unchanged prices. Several cars of Prairie Province Eggs have been received but these are for the most part going into storage. Imports of States eggs have been fairly heavy during the past week but this has not affected the price of local fresh which are costing 50-51c at country points.

Prairie Province markets are easier and prices to country dealers are now ranging from 42-46c. Receipts are now sufficiently heavy to allow for a surplus over carlot interprovincial shipments and some storing is being done at practically all western points. Carlots of firsts have been shipped to Montreal, Toronto and Vancouver from Winnipeg, Brandon Saskatoon, Moose Jaw and Regina, the prices for these ranging from 52-53c f.o.b. shipping point.

As previously noted the States markets have been easier during the past week and yesterday (Monday), Chicago prices were current firsts 40½-41½, storage packed extras 44½, storage packed firsts 43¾; New York current firsts 44-46½, storage packed extra firsts 48½, storage packed firsts 46½-48.

Poultry—The Poultry market is practically unchanged, receipts of live and fresh dressed continue very light and the trade for the most part is confined to frozen stock. The same applies to the United States poultry markets.

Export

Eggs—The export season opened May 8th with shipments of 825 cases of States eggs to Liverpool and 420 cases of Canadian eggs to Glasgow. Cable advices point to a slightly improved market in Great Britain and if this continues and lower prices ruling on this side it is altogether likely that further business will be done.

Poultry.—On account of the favorable prices being paid for poultry in Great Britain inquiries have been made with regard to the possibility of obtaining refrigerator space for export and information has been received from the Canadian Pacific Ocean Services, Limited, stating that any application for refrigerator space for June sailings should be made immediately. The ocean rate for refrigeration at a temperature of 25 degrees or lower is now $2.50 per 100 pounds.

eggs last year sold on the British market at a premium as high as 24 cents per dozen, or about one million dollars in the year. Canadian exporters are now receiving inquiries from the British trade, and business is anticipated at an early date. According to recent cables, on account of their reputation established last year, Canadian eggs are in good favor on the British market.

Figures for the fiscal year ending March 31st show that animals and animal products to the value of over three hundred million dollars were exported from Canada, an increase of sixty nine milions over 1918. Included in the above were over four hundred cars of eggs, approximately six million dozens. Of these sixty-eight cars were Fresh Extras, and ninety cars Fresh Firsts, while 27 cars were Storage Extras, and two hundred and five cars were Storage Firsts. Nearly all went to Great Britain. This was an increase of over five million dozens over 1918.

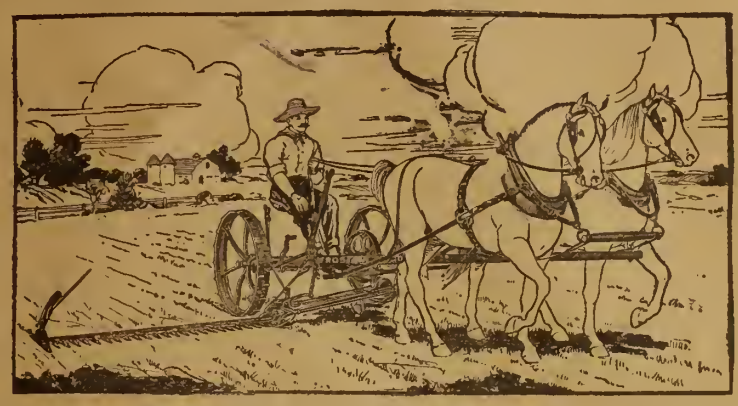
Chinese Egg Case Before Washington Court

Partial disclosure of the attitude to be taken by both parties to the Chinese egg case in Washington was given at Olympia, Wash., last week when the Poultrymen's Association filed its brief and the attorneys for Parrott & Co. gave a partial idea as to their attitude. The poultrymen's brief is all from the health standpoint and has as its main source of information, Dr. Murphy, a Catholic priest, who was in China many years as a missionary and is now engaged in newspaper work in Seattle. Dr. Murpry claims that the Chinese eggs are very old by the time they are gathered from the farms, that it takes weeks longer to bring them to this country and they are produced under insanitary conditions. He holds that Chinese eggs come from a part of the country where the temperature is 100 to 115 degrees and that eggs start to incubate at 103 degrees, and that this process starts within 48 hours after laying. Therefore he says any storage only delays this deterioration and that the break-down starts again as soon as withdrawn for use in the United States.

Frost & Wood

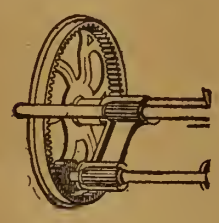
A money making machine for a money making crop.

With feedstuffs climbing in price you can't afford to take chances with your hay crop. Scrap that old mower and get real efficiency with a



Frost & Wood Mower

The longer you own one, the heavier the crop you put it at and the rougher and more hilly your land, the more enthusiastic you will become over the many splendid merits of the Frost and Wood Mower. Its high quality roller bearings ensure light draft. Its cutter bar strength and superior cutting mechanism guarantee long service, good service and service when you want it. All levers easy of control and handy to reach. Thousands of farmers have good reason to swear by the F. & W. Mower.



F. & W. "Internal Drive" gear means real efficiency

Look for this Frost and Wood feature. The pinion which takes the operating power from the big drive wheel, "runs on the inside." The two wheels turn in the same direction. No tendency to fly apart, become rattly and break cogs. Always ready for work and a quick start into a heavy crop doesn't bother this gear at all. The knives keep on cutting when bar is raised to clear obstructions, saving time—and crop.

We don't want you to judge the Frost and Wood Mower by this meagre description. Write us today for special Mower Pamphlet. See the Mower, and the rest of our big, complete line at our nearest Agents.

THE FROST & WOOD CO. LIMITED

TRURO ST. JOHN CHARLOTTETOWN

DAIRY PRODUCE MARKET REPORT FOR WEEK ENDING MAY 15th

Prices for Montreal, Toronto & New York are for Butter & Cheese delivered there.

Montreal:—The butter market was firm at the beginning of the week, No. 1 creamery realizing ¼c per lb. over the previous Friday's price. At the auction sale of the Co-op. Society on Monday, 683 pkgs. were sold as follows:—105 pkgs. pasteurized at 56⅛c; 445 No. 1 at 55⅜c; 133 No. 2 at 54¼c. On Tuesday at Gould's storage 300 pkgs. No. 1 creamery sold at 54¼c. On Friday the offerings of the Co-op. Society met a weaker market, the decline amounting to ⅞c on No. 1 grade and ¾c on No. 2. 803 pkgs. were sold as follows:—115 pkgs. pasteurized at 55½c; 540 pkgs. No. 1 at 54½c; 148 No. 2 at 53½c. There was no sale at Gould's on Friday. On Saturday at St. Hyacinthe 100 pkgs. sold at 53c f. o. b. shipping points. Receipts from May 1st to 15th amounted to 12,778 pkgs. compared with 20,371 pkgs. for the same period last year, a decrease of 7,593 pkgs.

The cheese market was steady last week. At Gould's Cold tSorage on Tuesday 750 boxes Quebec cheese were sold at 31c. On Friday the usual sale at this market did not take place. Sales at country boards during the week were as follows:—Thursday—Brockville offered 2,358 boxes with no sales on the board. The best bid was 30¼c and it is understood all the cheese were afterwards sold on the curb at this price. Campbellford, 365 at 31c; *405*Kings-boarded, 90 sold at 30⅝c; Stirling, 603 at 30¼c. Friday—Napanee, 760 ton boarded, 125 sold at 30 15/16c; Iroquois, 608 boarded, 215 sold at 30½c; Picton, 600 sold at 30 11/16c. Saturday—Belleville, 719 at 30 9/16c; Cornwall, 967 at 30⅝c; St. Hyacinthe, 200 at 30c. Receipts from May 1st to 15th amounted to 25,424 boxes compared with 27,245 boxes for the same period last year, a decrease of 1,821 boxes.

Toronto:—Last week the butter market ocntinued on a higher basis than the Montreal market. On Monday no sales were reported and the market was said to be easier than the previous Friday when 62c was the price paid for No. 1 creamery. On Friday, the 14th, No. 1 Ontario creamery was worth 60c delivered Toronto.

The cheese market was firm throughout the week at from 31c to 31½c for large cheese, and twins ¼c higher.

New York:—The butter market was irregular last week, but with no net change in price. On Monday creamery extras, 92 score, made 62½c, an increase of ½c over Saturday. On Tuesday the market was weak and the price nropped to 59½c. On Thursday the market was steadier at 60c and closed firm on Saturday at 62½c. The season is backward and in some sections the cattle are reported in poor condition.

The cheese market was quiet but steady. On the 14th instant Wisconsin twins sold at 26½c f. o. b. shipping points and were quoted to jobbers and wholesale grocers in New York at 30c and 30½c. Some purchases in this market of whole milk cheese for export were reported at 27¼c.

General Notes:—On the 15th inst. we received the following cable from Mr. A. E. Griffith, Cargo Inspector for this Department at London:—

"Rationing of Government butter will cease May thirtieth owing to largely increased British and Irish shpplies. Private importing still prohibited as outlook not such as to justify complete decontrol. Maximum retail price to be maintained at three shillings per pound."

We understand the above cable to mean that the ration of 1½ ozs. per head will be abolished at the end of this month and the only restriction on the retail sale of imported butter will be the maximum price of 3 shillings per pound. It should be noted that private importation will still be prohibited.

Postscript

Montreal, May 17, 1920: Today's auction—125 pkgs. pasteurized creamery at 55⅛c; 531 pkgs. No. 1 at 54⅜c; 146 pkgs. No. 2 at 53¼c. No. 1 cheese 31c to 41¼c.

Toronto, May 17, 1920—To-day's sales—No. 1 pasteurized -Ontario creamery at 55c; No. 2 at 53c. No. 1 cheese at 31c, twins 31¼c.—J. A. Ruddick, Dairy Commissioner.
Ottawa, May 17, 1920.

Management of the details often bridges the difference between profit and loss. Watch for the leaks in your business.

TO KNOW SEX OF EGGS AND CHICKS

It is impossible to tell by the egg whether a male or female bird is to be brought forth. The germ up to several days of incubation is exactly the same for both sexes. Something, causes or conditions yet unknown, determines which sex the little chick shall be, and who knows but the one gaining supremacy has to crowd the other sex out of its chance of trying life here? As a rule, we get around the same number of male as female chicks, when hatches are normal. When they are poor, more males are the result.

The only kind of which the sex can be determined while young is the Barred Rock. In these the male chicks will be found to have a pure yellow beak and legs, while the female will have dark color on the beak and legs. This holds good in nearly every case, and it will prove correct in fully 90 per cent. of cases.

Dampness in a poultry house at any season is nearly always caused by a lack of ventilation. In open-front houses we find the air is fresh and clean at all seasons and there will be no moisture dropping from the ceiling to the litter. The open-front house is free from odors and the birds do not seem to freeze their combs as quickly as in a closed house.

VALUE OF MANGELS OFTEN OVERLOOKED

In planning the farm areas for the coming season's crop every farmer should set apart a few acres on which to grow mangels. The size of the mangel crop on farms that are not yet provided with a silo is imperative. Without a silo there is no other way of providing the same quality of succulent feed that live stock must have in the long winters of Canada, in order to promote healthy growth of young animals and the general welfare of mature animals. Even on those farms that are equipped with a silo, a small area of mangels will prove of great advantage; the experienced feeder knows full well that a variety of succulent feed is relished by farm stock. However nutritious and succulent ensilage may be, an occasiontl change to mangels is a good tonic.

The mangel has never been given the prominence among the farm crops of the small dairyman or stock raiser that it should receive. The fact that it more nearly resembles silage in the amount of succulent feed it contains, should in itself recommend it to more general use on the average farm.

In growing this crop a comparively rich soil should be selected and well fertilized with well-rotted manure. The ground should be worked into a fairly mellow condition as the young plants are of very slow growth at first and on rough cloddy ground, it might be very hard to control the weeds until the mangels get a good start. The time of planting is about the same as that of corn, when the ground is good and warm.

Where pigs and poultry are kept a few mangels should be grown for them. If this were done on every farm where this class of stock are kept there would be less inquiry made in regard to trouble and disease in the pig and poultry pens. It is true that in growing mangels there is a good deal of labor entailed, but a smaller area well handled will grow a larger area that is often parthan a larger area that is often partially neglected.

UNITED STATES EGG EXPORT TRADE WITH GREAT BRITAIN

Extracts from a recent copy of the New York Produce Reviow:—

"In January, New York Produce Review wrote to an English egg merchant who had lately returned home from the States, asking for his views as to the prospective needs of Great Britain for American eggs during the coming season, and for any remarks that he might consider of interest in connection with the trade."

"The writer declares that the American United States egg trade with England during the past season has been disastrous to every firm who has indulged in it to any great extent. Some of those who dealt with Canadians, he says, have been more successful because of the closer candling and higher quality of the goods shipped from Canada. Particularly bad results, this correspondent declares, were experienced in a majority of the eggs shipped from New York."

Commenting on this the New York Produce Review says:—

"It is doubtless true that the Canadian eggs gave better satisfaction as a rule than the goods sent from the United States. The climatic conditions that are more favorable and we shall not attempt to deny that the Canadians' export trade is more carefully handled—a fact that is not gratifying to a United-Statesan who would like to be proud of his country's commerce. The difference in value in English markets between Canadian and United States eggs as reflected in current market reports was not generally, however, such as our correspondent's tirade would lead one to expect, though it was considerable as a rule, and enough to make one wonder why it was so much."

BULLS AND MEN

In Waukesha County, Wisconsin, there are ten Holstein bulls the average cost of which was $19,455. One of them is owned by five men. Two or three others are owned by groups of men, the others are owned by individuals.

In this same county there are also more than 500 grade bulls of indiscriminate breeding.

The men who own the high priced animals are engaged with other progressive men in waging a war on the grade bull. They are determined to eliminate him. The 500 grade bulls are presumably owned by 500 individual farmers. (It is not believed that men would organize into groups for the purpose of owning a grade.)

The campaign is being waged in earnest and with splendid results. The big factor that brings the results is the offer of the progressive men to exchange "even up" a purebred for a grade.

It is easy to determine the difference in bulls and to appreciate their value or their worthlessness but it is a problem to understand the wide difference there is in men.

Th men who use purebred bulls, in 99 cases out of 100 read farm papers and breed journals. They attend the State Fairs and National shows and conventions. They watch the breeders' sales and take part. They organize and met often. These things all have an influence. They extend their vision ,they broaden their viewpoint, they extend information and they inspire greater activity.

The men who own the grade bulls lack vision because they are hemmed in by narrow prejudices and limited experience. They do not read. They do not mingle with other men, and hence their opinions do not change.

No one can deny the oft repeated statement that the character of man is reflected in the cattle they breed. —The Dairy Farmer.

Percherons & Belgians
30 Head
Stallions & Mares
FOR SALE

Come to Grenville and buy the kind with the big, round feet, clean, hardy, dry bone and joints, sloping pasterns and straight, flashy action. Buy the kind with the sloping shoulders, short back and long, level croup. Buy the modern Percheron or Belgian.

Our prices are very reasonable, and we will give up to three years time, to responsible parties.

All stallions government inspected.

WHY HENS HIDE THEIR NESTS

On nearly every farm where the hens have a wide range a good many dozens of eggs are lost during the spring and summer months because some of the hens like to steal their nests out in the grass and weeds or about the outbuildings. When a nestful of such eggs are found they are, as a rule, unfit for any use and represent a definite loss from the profits which the flock is capable of returning its owner.

Stolen nests cannot be prevented entirely on the farm, for instinct undoubtedly prompts some of the hens to stray away from the regular nests when they have the opportunity to do so; but the habit can be combated quite successfully by the simple expedient of providing plenty of clean, inviting nests in the henhouse or in the yard near the building. For whenever hens in large numbers decide to stray there is usually something seriously wrong with the present methods of housing and nesting. Filthy nests or insufficcnt nests will cause nearly any hen to seek other laying quarters. Of all the causes for stolen nests, insufficient nests is perhaps the greatest, for if any of the hens find the available nests always occupied, they are surc to seek other places.

During the height of the laying season there should be provided a nest for every four or five hens in a flock; and all the nests should frequently be cleaned out and sprayed, and new nesting material put in, in order that the nests will always prove attractive for the layers. Then if added precau tions are taken to close up as many as possible of the undesirable nesting places, such as underneath the floors of buildings, and to pen up the broody hens as soon as noticed so that they will not be occupying the available nests unsecessarily, little trouble will be experienced with stolen nests.

The Henhouse Nest

Obviously, the arrangement of nests will vary, according to the requirements or personal preferences of individual poultrymen. Experienced poultrymen, pretty generally agree, however, that all nests should be easy of access and at a convenient height, for at the seasons when hens become broody it is necessary to go over all the nests every night and remove those showing any inclination to sit. Broodiness must be promptly broken up, or there will be a serious falling off in the egg yield; and unless the nests are readily accessible, this detail in the daily routine will consume considerable time and is likely to become decidedly vexatious. All nests should be made movable, of course, in order that they may occasionally be readily removed from the building to be cleaned.

A good arrangement for nests is to locate them on shelves along the rear and side walls of the henhouse. The shelves or platforms should be about two feet wide, and may constitute the floor of the nests. For the collection of eggs there may be a single door for each nest, or a door extending the entire length of the battery of nests. Another good arrangement especially during hot weather, is to place the nests outside the building, on the coolest side of the henhouse, allowing the wall of the house to form the back of the nests. The hens may gain access to these through openings cut in the wall of the house or from the outside, the front of the nests being left cpen. A battery of such nests should be protected by a top board which slants like a half-pitch roof, and which is nailed up close to the side of the building. Such an arrangement of nests not only adds to the comfort of the layers in hot weather, but the nests occupy no house room and the caretaker can gather the eggs and inspect the nests at any time without estering the building.

No Fighting, No Crowding

It has been proved that hens lay equally well in open or in dark nests. The one advantage of nests of the latter type is that they tend to prevent development of the egg-eating vice. Some poultrymen now employ nest boxes eight or ten feet in length without any divisions and with openings only at the ends. The top board is hinged and may be raised to remove the egg or broody hens and to put in fresh nesting material. There is no fighting and no crowding in a nest box of this kind. The hens make their own nests in the straw or hay and do not bother each other, with the result that there are fewer broken eggs.

When all the nests in a henhouse are along one wall it is a good plan to have them closed off from the rest of the house by wire netting, which prevents the fowls from roosting on them and thus soiling them unnecessarily. The hens can gain entrance to the nest platforms through a little door, which may be shut toward the close of the day at feeding time.

The use of nest eggs, which used to be supposed would attract hens to nests even though the nests might be uninviting, is almost obsolete. Some poultry raisers still use nest eggs more because of force of habit than because it is really believed that they possess any value. The fact is now pretty generally recognized that the layers are either attracted or repelled by the condition of the nests and that the use of nest eggs has very little to do with the hens straying away. The poultry raiser who still believes that nest eggs are necessary should use the heavy glass ones, for they at least can do no harm if they do no good, while the disinfectan nest egg, supposed to serve the twofold purpose of decoy egg and lice killer, may give the eggs laid in the nest with it a disagreeable flavor. In no case should a real egg be left in a nest as a decoy, for in time it becomes rotten and then breaks or explodes over the nest and fresh eggs. W. P.

COMFORT
The Closed Car is growing in favor among men who have used cars for several years.
Always comfortable in all extremes of climate, the Coupe is the ideal car where a limited passenger carrying capacity is needed.
For business and professional needs or for social or patriotic duties the McLaughlin Master Six Coupe is the choice of the "Motor Wise."

INSECTS ON FERNS

Little white flies are in the earth about the roots of my potted ferns. The ferns do not seem thrifty. What can I do? G. G.

For increasing the vitality and life of a fern, washing with a weak soap soltuion is quite often recommended. Some success may be had by putting a tablespoonful or a little less of ammonia water in the water which is used for the fern. Fumigation with tobacco smoke has also been found efficacious by some fern lovers.

SELECTING THE BREEDING EWE

A good ewe is an asset to the farm; a poor ewe is likely to be a liability So one of the most important factors in starting the farm flock is to start by selecting the proper kind of breeding ewes. Like the dairy cow the ewe must have a good udder to be a good money maker. The soft, pliable udder free from hard knots is the kind to look for. More important than the udder, however is the ewe's mouth. Without a good solid mouth, the ewe is handicapped in both wool and lamb production. Ewes with part of their teeth gone or the "nippers" loose or badly worn require special attention and additional care which makes their selection undesirable. It's the ewe in good health and thrift that makes the good investment. The extremely thin, emaciated ewe should be avoided and the other extreme, the fat ewe, as well, Fat ewes are too frequently not regular breeders, and carry their flesh because they did not raise lambs the previous year. A fleece of good length and strength which densely covers the body, is an important mark of a good ewe. The good-sized ewe with a blocky conformation helps to make up a profitable lamb-wool-mutton combination.

GROWING POTATOES FOR LARGER YIELDS

(Continued from page 627)

McIntyre for Prince Edward Island and Burbank for Nova Scotia. The Irish Cobbler and Green Mountain are two of the best for the province of Quebec, and for Ontario, except that in south-western Ontario, the Dooley of the Rural group of potatoes, has done exceptionally well, and seems more suited to stand the hot weather than most sorts. In Manitoba, the varieties most thought of are: for early, the Early Ohio, Bovee and Irish Cobbler, and for main crop those of the Green Mountain group, which includes Gold Coin, Wee MacGregor, Uncle Sam and Delaware. These varieties cannot be distinguished from Green Mountain. They are grown in Eastern Canada also.

The soil for potatoes should be well worked before planting time. While some crops need the soil comparatively firm for best ersults at time of seeding, the soil for potatoes should be loose. In such soil the tubers will be shapelier than in firm soils. The ploughing under of manure and clover will help to loosen the soil and at the same time add plant food which is readily available. The nearer the land can be got into a thoroughly pulverized condition t oa depth of six inches or more ebfore planting time the better the crop is likely to be. Moderately heavy application of commercial fertilizers have been found profitable, slightly better results having been obtained by sowing the fertilizer over the sets after they have been covered by a few inches of soil, and then covering the fertilizer by harrowing than by sowing the fertilizer in the drill before the sets are planted. From 800 pounds to 1,200 or more poounds of a complete fertilizer are used by some growers.

The most economical distance to plant has been found to be in rows two and one-half to three feet apart with the sets from twelve to fourteen inches apart in the rows. The sets should be about four inches deep after the ground is levelled after planting. Planting machines will be found very satisfactory where large areas have to be planted.

Potatoes are sometimes ploughed in if one has to plant on land which has been in sod until planting time, and fairly good results are sometimes obtained if the land is worked well afterwards. One of the best methods of planting in green sod is to have some one planting when the ploughing is being done, the sets being dropped every third farrow and covered by the plough when the next farrow is made. After the potatoes have been planted the ground is disc harrowed, and if it is light soil it may be rolled after that to help close up any openings twhere grass could grow through and to compact the soil a little and hasten the rotting of the sod. This would not be desirable where the ground was heavy as it would make it too firm.

In order to save hand labour later on and to ensure quicker growth of the plants it is desirable to harrow the land a few days after the potatoes are planted but not before the weed seeds are germinated. Even if the potato plants are beginning to appear above ground little harm will be done to them if the sets were planted four or five inches deep.

Cultivation should begin as soon as the plants are up sufficiently to mark the rows and continued at intervals of about a week or after rain until the plants meet across the rows. While the early cultivation may be deep, the later ones should be very shallow so as to avoid injury to the roots or young tubers. Where the seasons are very dry, better crops are likely to be obtained by leaving the soil level, while in moister climates and heavier soils ridging or hilling up will give better results.

Needless to say the "bugs" must be prevented from injuring the tops for if the foliage is eaten the yield will be seriously reduced. Where late blight is troublesome the tops should be kept sprayed with Bordeau mixture from early in July until the tops are dead. Sometimes one spraying with Bordeaux mixture will save the crop from much injury from blight and rot if it is put on at just the critical time, but as one cannot very well tell when this is the plants must be kept covered with mixture from the time when injury is likely to first occur.

AVOID THE SCRUB PUREBRED RAM

The sheep breeding season is rapidly approaching and it is desirable insofar as possible to select the head of the herd early. Let the ram selected be a purebred, good representative of the breed chosen. Such an animal when used on common-bred ewes will show striking results. There are too mmfwyp etaoin shrdlu etaoin taoinee many breeders that think any purebred ram will be a suitable sire, but such is not the case. Avoid the scrub purebred, the stunted animal of pure quality.

Rams of the medium or long wooled breeds are sufficiently developed and fit for service at the age of one and one-half years. Where only four or five breeding ewes are kept, an early developed ram lamb may be used, but the continued use of young, immature sires will result in decreasing the size and vigor of the flock. A ram that has not been used too freely may be used up to six years of age. It is a good practice for two breeders to exchange sires at the end of a couple of years. A tried sire of known worth is better than a young sire.

Let the ram possess vigor and vitality as indicated by short, broad head, large nostrils, bold eyes, width between the ears, a short neck, a wide chest and broad, level shoulders. His fore legs should be straight and short and set well apart. He should be broad and deep in heart girth which insures a strong constitution. A broad, straight back with well sprung ribs is essential. A smooth, wide and thick loin adds greatly to the value of the sire. He should have a long, level and wide rump with a full, deep twist. His hind legs, like his fore legs, should be short, straight and wide apart. The flanks should be thick and low forming a straight side line as well as straight underline. He should appear of medium size, low set, compact, very masculine and with alert, quick movements. A luggih, overgrown, and loosely made ram is seldom prepotent. With the present prices of wool when a good fleece will pay for a year's feed, the quantity and quality of wool is important. A skin which is bright and pink in color, indicates good feeding quality. A strong vigorous ram will care for forty to fifty ewes.

USING BOTH RIGHT AND LEFT HANDS

Why do not farmers in their ordinary work, such as pitching bundles, scooping grain, and so on, learn to do the work with both right and left hands? It is really surprising to one who has never tried it, to find how much it rests one n pitching bundles to a separator or at any similar job if he changes occasionally from right to left hand.

I first noticed this fact when a boy on the farm. I was naturally right handed, using all single tools in my right hand and with my right nearest the work to be done when both hands were used. In some cases, such as scoopng corn from a wagon or grain from a box or in pitching bundles, the fact that my father and both brothers were left handed and I had to work in the same position they did, caused me to use these implements left handed.

Induced through a desire to make the work easier for me, I began trying the idea of changing occasionally from right to left handed in doing certain work, as I saw no reason why I should not with practice, do practically everything with either hand next to the work. At the first the work seemed rather awkward, but I soon found that the change brought into play almost an entirely new set of muscles, and rested me almost as much as an entire stop.

As I became older and gained more practice, it soon became almost as natuurel and easy for me to do much of my work with either hand; and now I never think of pitching bundles to the load or to the separator, pitching hay, scooping grain, shovelling dirt, using a rake or hoe, and so on, without changing hands every fifteen or twenty minutes. I have found by experience that I can do more work and with less fatigue than with the old way. Of course, there are some kinds of work where skill rather than strength is required, such as driving nails, where I have never made any effort to use my left hand, nor have I ever become expert chopping left handed but if the necessity arose I could easily acquire the necessary skill.

This is a matter of much greater importance than is apparent at first thought. Because you have always done certain work right handed is no reason why you should not try the easier and better way of changing occasionally, because it may happen that you may lose the strength or use of that hand and may have to depend on your left one. The later in life such work is started the harder it will be to pick up, and I wish to urge, especially on the boys, that they make the start and find out how very much it will rest them.

DISEASE RESISTERS IN POULTRY FLOCK

Every poultry keeper who is observant probably has noticed that there are always some birds in his flock of chickens which are "immune;" that is, they escape all diseases, while the other members quickly contract any disease which appears in the flock, or even in a neighboring flock, and many often succumb within a day or two. Fef fowls are entirely free from contagious diseases if conditions are favorable for a disease to spread from its first victim, but there are some families among all breeds that are hardier than others. Roup and other contagious diseases have been known to prevail in yards in which certain fowls quickly succumbed, while other birds that roosted, ate and drank with the sick fowls showed no signs of disease. A bird may have the roup sometimes, spread the disease with fatal results to its mates, but recover itself and live to an old age. While such a bird may appear to be healthy and vigorous, not infrequently it is for years the source of infection for the entire flock, causing the death of many fowls that are more easily affected by the disease.

Such cases as cited surely emphasize the importance of disposing of all birds which are known or suspected to have had a contagious disease like roup, even in a light form. All such birds should be killed, and their places filled with others that are known to be healthy. Especially when an entire flock is attacked must prompt action be taken and the affected fowls destroyed. The labor involved in handling a large number of sick birds of ordinary value is too costly on the farm. It is generally less expensive and more satisfactory in every way to get rid of a disease-stricken flock outright and make a fresh start, than to spend time and labor for several months in doctoring the sick birds.

Equipment that saves time and labor and affords a cleaner product from your dairy is economical.

The best cow is always more nervous that the poorest one. Be kind and gentle to her and she will repay you.

EMPIRE-BALTIC

The Separator with the MILLION DOLLAR BOWL

HERE'S an announcement of great importance to YOU—to every farmer owning cows; for it brings to Canadian Dairymen the latest development in Cream Separator Construction—the EMPIRE-BALTIC Cream Separator, with the MILLION DOLLAR BOWL.

Seems like a lot of money for a manufacturer to spend on a Separator Bowl, doesn't it? But when you consider what it means to cow-owners, a million dollars is only "a drop in the bucket" to what the EMPIRE Million Dollar Bowl will save each year for the Farmers of Canada and the United States.

For this wonderful bowl, the product of years of study and experiment by a score of the foremost separator engineers, sets a new standard of separator performance:

It is self-centering and self-balancing; practically no vibration; and so does not agitate the milk; it skims clean all the time; it is easy to turn, frictionless; once adjusted it is adjusted for life; its discs are interchangeable—a great convenience in cleaning and assembling. It is the last word in Bowl construction—Simple, efficient, convenient and practically everlasting.

Compare the Empire-Baltic with any other separator! And remember, in making the comparison, that your butter profits are made or lost in the bowl.

Investigate the Bowl

You'll find other Separators as good looking as the Empire-Baltic—no manufacturer has a corner on good looks. You'll find other Separators made, like the Empire-Baltic, out of the best materials obtainable—anyone can buy the best grades of materials. But you'll find only one Separator with the MILLION DOLLAR BOWL — an exclusive EMPIRE-BALTIC feature—fully covered by basic patents.

Space prohibits our telling you here all of the superior Empire-Baltic Features, but the Million Dollar Bowl alone is important enough to impel you to see the nearest Empire Dealer at once—learn all about the Empire Baltic. Or send at once for catalog No. 20

This trade-mark is found on the **Supreme Separator.** It is displayed by the **Best Separator Dealers** throughout the country. It is the sign of **Highest Quality** in materials, workmanship and service. It is the "Family Coat of Arms" of the leading line of Dairy Machinery —EMPIRE.

The Empire Cream Separator Co., of Canada, Ltd.

Manufacturers of Empire Milkers and Gasoline Engines

TORONTO and MONTREAL

DISEASES OF BEES AND TREATMENT

Bee diseases are of two kinds:—Diseases of the adult bee, which happily in Canada, have so far been of a transient nature because no effective treatment is known; and diseases of the brood, of which there the three, American foul-brood, European foulbrood and Sacbrood.

Since each of these three diseases is treated differently, and since the first two cause great loss when neglected, it is importont that every beekeeper should be able to recognize andtinguish them so as to treat the serious ones effectively and without delay.

The diseases affect the larva, or worm stage of the bee.

In American foul-brood, the larva, just before capping, becomes a coffee-colored mass which is so tenacious or viscid that it will rope out sometimes to a length of several inches if a toothpick be inserted into the cell and withdrawn, and it has an unpleasant glue-like odor. The mass dries down to a scale that adheres tightly to the lower cell. The capping of the cell containing the affected larva is usually discolored; it is often irregularly perforated, or it may be removed altogether.

In European foul-brood, most of the larva are saricken before they are capped over. They lose their shape and collapse at the bottom of the cell, apeparing as if they had been melted and turning to a light straw or gray color. The decayed brood has a slightly sour smell to which is sometimes added a strong odor of putrefaction. The mass ropes out either not at all, or but little, and the dried scale is easily detached.

In Scarbrood, the full-grown larva lies stretched out on its back in the cell, discolored but with skin and shape intact. The juices of the larva are watery and contain curd-like particles.

American foul-brood is treated by shaking the bees into a clean hive containing frames fitted with foundation without any of the honey, and taking away the combs of brood and honey which contain the spores of the disease. The bees must not be allowed access to the honey unless it has been boiled for an hour, although it is fit for human use. The combs may be rendered int owax. The hive should be disinfected by scorching.

European foul-brood is treated by introducing young Italian queens and keeping the colonies strong and well supplied with stores. This disease will spread very rapidly during a honey dearth in late spring and early summer. In severe cases, the colonies should be left queenless for one or two weeks before the Italian queens are introduced.

Scarbrood usually disappears after a few weeks and calls for no treatment.—F. W. L. Sladen.

HOW MILK PAILS SHOULD BE WASHED

Tomorrow morning when you finish milking, rinse the pails out with cold water, then with some hot water and soap powder scrub them thoroughly with a good brush. Be sure that all the corners and seams are well cleaned. After that, rinse out the pails with warm or hot water. Then scald them with boiling water or steam them if there is some way of getting steam. When you feel that they are absolutely clean, turn them upside down on a rack to dry, over a heater or out in the sunlight.

When you are ready to milk in the evening, you will find the pails clean, dry and sweet. The bacteria have had a very hard day of it. Handle the pails as carefully after the evening milking. When the fresh milk enters the pails, it will find a clean berth. In its journey to the factory it should travel in cans as clean as the pails, for they should be as carefully cared for. You are thus producing a better and safer milk, one more valuable as food and as a source of income.

WEEDS ARE ROBBERS

Weeds are robbers because they steal plant food and soil moisture away from the crops and thus reduce crop yields. Good crops and weeds cannot grow together. To keep the farm free from weeds, few methods give such good results as a systematic rotation of crops with regular seeding down to grass and clover with ever three or four years.

The best time to destroy weeds is when they start growth. Harrowing or cultivating at this period is fatal to young weeds. Later they must be cut off with the cultivator or hoe or pulled by hand. Not even a few weeds should be allowed to develop seed, for each mature weed will bear anywhere from a few hundred to several thousands seeds, each of which may produce a new weed next year. It is well to encourage the germination of any weed seed that may remain in the soil. The only way to clear foul lands of weeds is to sprout the seed and then kill the young weeds. Early plowing and frequent cultivation will accomplish this result.

CULTURAL METHODS FOR QUACK GRASS

Quack grass is a perennial, propagated by seeds and creeping root stalks, persistent in all deep plowed lands and in all crops, having great power in spreading and choking out other plants.

The permanent means of bringing this weed under control is to adopt for the area infested a sort rotation of crops or cropping plan which includes a hoed crop, once in three or four years. A short rotation of three years' duration is preferable since there is a hoed crop and only one crop of hay in a three year period, conditions which tend to give the pest the least chance of flourishing. Another suitable rotation is one of four years' duration of one year each in hoed, grain, clover and timothy hay crop. For timothy hay or pasture areas the procedure is as follows:

Allow the plant to exhaust its substance in the production of a hay crop, which should be cut and removed as soon as the head is formed and before it is in bloom. Plow shallow, roll, disc once or twice to break up the sod and then cultivate with a stiff-tooth cultivator until the rootstalks have been pulled to the surface of the soil. When the accumulation of roots is so great as to interfere with the efficient working of the cultivator remove or burn them and continue cultivating in order to complete the work. In the autumn, ridge or deep plow the field. Ridging exposes a greater surface of soil and couch roots to the action of frost than ordinary plowing. Frost is an agent in the control of quack grass that should be made use of on every possible occasion.

Grain areas that contain quack are not in fit condition to be seeded down to grasses and clovers nor are they in shape for the growing of profitable crops in the future until after control measures have been introduced. Immediately after harvest stubble land should be shallow plowed, disced once or twice to break down and consolidate the furrow slices after which the stiff-tooth cultivator can be employed to advantage to obtain the necessary depth to facilitate the drawing of the root stalks or underground stems of quack to the surface. Cultivation should be thorough and the fall treatment as outlined for meadow or pasture land will apply on stubble.

The stiff-tooth cultivator is an essential implement in any cultural plan for the control of quack grass. The disc harrow used as the combatant implement acts as a force

against the success of otherwise thorough treatment. The use of the disc harrow in this connection should be limited to work of disintegration and pulverizing sod and surface soil. The object is to draw the entire rootstalk to the surface rather than break each root into several parts. Each small piece, like the potato set is capable of establishing a new plant.

The following spring the area treated as described, should be planted to hoed crop for which manure may be applied, before the last plowing or ridging in the fall or during the winter or spring. This brings us to the first year of the rotation from which period the procedure in cropping would be outlined in the rotations recommended.

Where no regular hoed crop is grown, which is poor farm practice, rape or buckwheat sown on an infected area after it has been thoroughly cultivated and the rootstalks removed, prove excellent smothering crops. For late sowing and as "first aid" in the control of the weed on an excetpionally dirty field where other crops would be choked out and before attempting a hoed crop the two mentioned crops are very useful. Smothering crops, however, are recommended only a temporary means of control. It is only by thorough persistent cultural methods and the proper utilization of crops that any satisfactory degree of success will be attained.—W. L. Graham, Assistant Field Husbandman, Experimental Farms System.

"CLEAN UP AND KEEP CLEAN"

Ramshackle. That is the word. Was just thinking of a farm that we visited a short time ago. It was not different from many others except in degree—a gate broken down, a wire fence partly destroyed, a couple of old wagon wheeds leaning against the fence; here a broken box, there an old washing machine. Ramshackle. I do not know whether it is of Greek derivation, perhaps from Rameses or some Egyptian god, but it fits. Does it fit your place?

Clean up. Destroy and burn as fuel all wooden parts, collect and sell to the junk man all castings. What you cannot burn or destroy, bury. You have not time? You have time. You cannot afford the time? If you have cows to sell, the impression given to prospective purchasers is a valuable asset in making a sale. Who wants to buy live stock from a man who has not the time to clean up the litter about his feet? If he is careless there he is careless possibly in keeping breeding records.

First impressions are lasting. That is why so much stress in the creamery to have the tubs clean, the paper neatly folded, the tub tins evenly distributed and well nailed. That is why the cheese salesman likes to have his cheese free from mould, from careless finger marks. First impressions are valuable. When one enters a home where things are well kept up and neat we mentally say that man knows his business and we are willing to pay for his knowledge.

Ramshackle. It sounds poverty-stricken. It puts one in the class of the "down and outer." Clean up and keep clean. This will require constant attention, but it is worth it. It has a psychological effect on the buyer. It will have a similar beneficial effect on you. Get the habit. It, the habit of orderliness, is a good habit to get and the time to get it is now.

THE HOME-MIXING OF FERTILIZERS

The same raw materials used by the manufacturers are available to the farmer in compounding his mixtures. The inert "filler" or "make-weight," frequently added by the manufacturer serves osly to reduce the percentage of plant food, thus enabling the product to be marketed at a lower price per ton, though, in some cases, it may be used as a "conditioner" to keep the mixture in a friable condition, where a long period is likely to elapse between its manufacture and application.

The practice of home-mixing generally results in a saving of from 25 to 35 per cent in cost of the materials and possesses the additional advantage of enabling the farmer to prepare his mixtures in such quantities and proportions as the occasion demands. Moerover, in the employment of the separate materials he knows the source and availability of each plant-food constituent.

The operation of home-mixing may be simply and efficiently performed on the barn floor or other firm level floor by means of a shovel, a screen and a mallet or wooden post to break the lumps.

Having assembled the sacks of materials from which the batch is to be prepared, empty the contents of each sack separately on the mixing floor. If the material has set in a hard firm mass, use the tamper or mallet to reduce the lumps before passing it through the screen which should have about 10 wires to the linear inch.

The lumps which are too coarse to put through the screen may be separately crushed an, when reduced to a suffifficient degree of fineness added to the heap.

Each component of the batch having unudergone this preparation, its incorporation with the others may proceed.

The componen—usually the phosphatic fertilizer—entering most largely into the mixture ought to be first spread on the floor, the others being superimposed in successive layers. The batch is then turned by shovelling first to one side, then to the other for, say, four or five times. After turning once, the whole batch should be passed through the screen to insure the absence of lumps and to facilitate mixing.

One ton is usually a sufficient quantity to mix in one batch.

It is, as a rule, desirablo to apply the fertilizers to the land at once, or within 24 hours after mixing, in order that hardening or cementing of the materials may be avoided.

If it is known that the mixed fertilizers cannot be immediately used, it might be desirable to add a certain proportion of bone meal—itself an excellent fertilizer—for the purpose of checking this tendency to cake into hard masses after mixing.

Never mix basic slag, wood ashes or other substances containing free caustic lime with sulphate of ammonia, unless for immediate application as the lime, by displacing the ammonia, causes its escape as gas and a loss in valuable plant food ensues.—By Dr. Frank T. Shutt, Dominion Chemist, and B. Leslie Emslie, Supervisor of Expl. Work, Division of Chemistry, Central Experimental Farm, Ottawa.

BEAUTIFUL HOME IS ALWAYS ADMIRED

We are more the creatures of our environment than we ourselves suspect. When we see a run-down farm with buildings lacking paint, boards off the outbuildings, roof sagging, we at once say, "a poor farm, surely." We jump at a conclusion and may be mistaken; it may be inhalited by a poor farmer, or one without pride in his surroundings.

This value may not be altogether in dollars and cents. If it were then the loss could be computed; as it is the loss in self respect, consciously or unconsciously, is far greater than the financial one. If we live in poor surroundings we take a mental tone from them; we associate ourselves with poor things, poor farm equipment, poor home, and inferior standing in the community.

We do not mean to argue that the man with a small or cheap equipment is inferior or should be regarded as so; we simply wish to make the point that as we keep our surroundings our reputation rises or falls. The small house, neatly kept, surrounded with trees set to show the place to advantage, is often more admired than the large, ugly residence with nothing to set it off or relieve staring walls.

We have been so eager to be financially successful in our country that we have not thought some of these things worth attention. But we know that interior arrangement may depress the mind or make us nervous, easily vexed. A beautiful farm home is a product of study, of thought. It is not made in a day, but is the fruit of years of labor and has much to do with moulding character—more than most of us think.

The Rise of Maxwell is Due To Its Metals

Fine soil makes fine wheat; fine feathers make a fine bird; and fine metals have made the Maxwell. They have given it:

1—A life of 100,000 miles. 2—Thriftiness.

For its metals are light in weight. Therein comes thriftiness.

But these metals are of extra strength. Therein comes long life.

Metallurgists—those who have made the study of metals a science—will tell you that such metals are costly, but they guarantee quality in a car and their generous employment in a Maxwell is by far the best evidence anyone may need to determine its quality.

They are almost alone responsible for the rapid rise of Maxwell, for the fact that nearly 400,000 now have been built, for that ever-growing friendliness to Maxwell the world over.

MAXWELL MOTOR CO. of Canada, Limited, Windsor, Ont.

Lawndale Stock Farm

Jerseys and Shorthorns (Pure Bred)

Our Present Offering in Jerseys is as follows:—2 splendid young bulls, both from R. O. P. mothers, 1 dropped in June 1919, the other in July, 1919. They are beauties and the right sort.

Write soon for information to

I. M. LOVITT, M.D.,
Yarmouth North, - Nova Scotia

Elmwood Stock Farm

We have a few young bulls to offer, sired by Dutchland Colantha Sir Rag Apple, a son of Colantha Johanna Lad. His dam is a granddaughter of Pontiac Korndyke. Thus combining the blood of two of the greatest bulls the world has ever seen.

The dams are daughters of Dutchland Pieterje Count. These calves are a nice straight growthy lot.

Our Egg Price Now 47c

For the next two weeks we will pay forty-seven cents per dozen for strictly fresh eggs, f. o. b. St. John. Eggs must be shipped to "The Maritime Farmer," St. John, N. B., in case lots, by Express. We will take anything up to 1000 cases at this price. The quotation is the highest market price quoted at time of going to press. If you have fresh eggs to sell and the market rises, advise us. We will pay you direct, without the aid of a middleman the full market price. Be sure and see that the eggs are properly addressed. See also that your name and address are properly indicated on the label. In our last issue we offered 44 cents per dozen for eggs. The market jumped in response to this offer. We put hundreds of dollars in the pockets of farmers as a result. This week we offer you another chance to make a dollar.

In our next issue we will make you an offer for your dairy butter. We believe it will be well worth watching for. The goods will be shipped to St. John, under the same conditions as eggs shipments are being made. We want only good butter—and we are not looking for anything except butter which will command the best prices.

Watch our co-operative columns. There will be money in them for you. You deal direct. Be your own middleman.

A Great Big Bargain

We have made a big buy in auto tires.

We have a lot of first tires which we offer at $16.50 f. o. b. Sussex. They are every one fully guaranteed and are from one of the leading manufacturers in Canada. Tires may go up but these are offered to you while they last for a price that will never come again this year. The supply is limited. We express the same day as order received to Maritime Farmer readers. The size is 30x 3½ and they are all Non-skids.

SUNNYSIDE STOCK FARM

Ayrshire Cattle and Chester White Swine

BULL'S CREEK FARM

R. O. M. HOLSTEINS

EXTRA SPECIAL—1 recently imported several Tuberculin Tested R. O. M. daughters of "Sir Lyons Segis" whose six nearest dams average over 30 lbs. butter each in seven days. These cows have in turn been bred to "Riverdale Lyons Echo Posch" whose dam, grand-dam and great grand-dam and dam's sister average officially 34 lbs. butter each in seven days. Am offering young bull calves of this remarkable combination of breeding and will sell a heifer calf or two. Get your orders in quick, they won't be here long.

J. H. STOCKTON, BULL'S CREEK FARM, WOODSTOCK, N. B.

Special Offering

Maple Green Farm Holsteins

On account of the great shortage in the supply of milk in our home town, we have decided (with regret) to dispose of our entire crop of Bull and heifer calves.

If taken inside of the next 30 days will price them away below their value.

The Dams of these calves are now running in the R. O. P., and the last official test conducted by the R. O. P. inspector showed an average test of 4.62% fat for the lot.

All are sired by our 32.32 lb. herd sire "King Korndyke Johanna", whose Dam is a full sister to Canada's Champion R. O. P. cow, "Jemima Johanna of Riverside". Milk in 365 days 30373; butter in 365 days, 1280 lbs.

Phone or write,

The Name Behind Canada's Greatest Electric Farm Plant

YOU can link the name Northern Electric with the ideal power and light plant for your farm as Canada's electrical engineers linked it when specifying the Nation's telephones.

First in the electric farm plant field is the Northern Electric name. The experience gained through years of successful electrical manufacturing is your personal safeguard for the lasting and steady dependability of

Northern Electric
POWER and LIGHT

The unit plant is simple in construction and of efficient design. It has no belts or pulleys. It is self-cranking; self-stopping; and its oversize Titan battery assures ever-ready current for both power and light needs. It is truly the leader for Canadian farms. We also have a belt-driven plant for use with ordinary farm engine, for those who desire this type of plant.

Your farm has need of time-saving, money-making, labor-saving electricity. Hundreds of Canadian farmers could tell you what it has done for them and their farms.

From coast to coast there are Northern Electric distributing houses—the one nearest you is always at your service. There, in stock, is the plant for your farm and everything electrical required for its installation. Make your whole plant Northern Electric—we willingly assume the responsibility for its perfect service.

If you now have electricity, either from Central Station or a private plant, buy Northern Electric appliances. We can supply your every electrical want.

We have prepared some interesting Power and Light literature.
May we send it to you? Fill out the coupon now.

A Flood of Energy for Farm Motors

Try These En-ar-co Products on your Farm

White Rose Gasoline

A pure, dry power fuel, that puts greater "pep" into your engine. Has a wonderful record for dependability.

En-ar-co Motor Grease

For differentials — gears — transmissions, on motor cars and tractors.

National Light Oil

A steady, clear-burning fuel for lamps, lanterns, heaters, brooders and incubators. No smoke or smell. Also the most economical tractor fuel.

Black Beauty Axle Grease

A dependable grease, that ensures a smooth-running, wear-resisting axle.

En-ar-co Motor Oil

The Scientific Lubricant

Perfect lubrication for your tractor, car, stationary or other farm engine is necessary if you are to get the greatest power from it.

Low grade lubricating oils are poor economy. Nothing but a perfect lubricant is good enough, because on it depends the smooth-running of your engine—hence the amount of power and the length of service.

Scientific Refining

has made En-ar-co Motor Oil the perfect lubricant. All the non-lubricating properties are removed from selected crude petroleum by trained workmen in the En-ar-co refineries. It cushions your engine's moving parts and removes all friction.

Thousands of gallons of En-ar-co Motor Oil were used with complete satisfaction in airplanes during the war—an exacting test. To-day, thousands of farmers are finding that it puts new energy into their farm engines.

Have YOU tried it on YOUR farm yet?

Order En-ar-co Products from your local dealer. If he hasn't got them, write us and we'll see you are supplied promptly.

Send for Our FREE Auto Game

A fascinating game in which autos compete in a cross-country race will be sent FREE to any auto, tractor, motor boat or engine owner who will fill out the attached coupon and mail it to us.

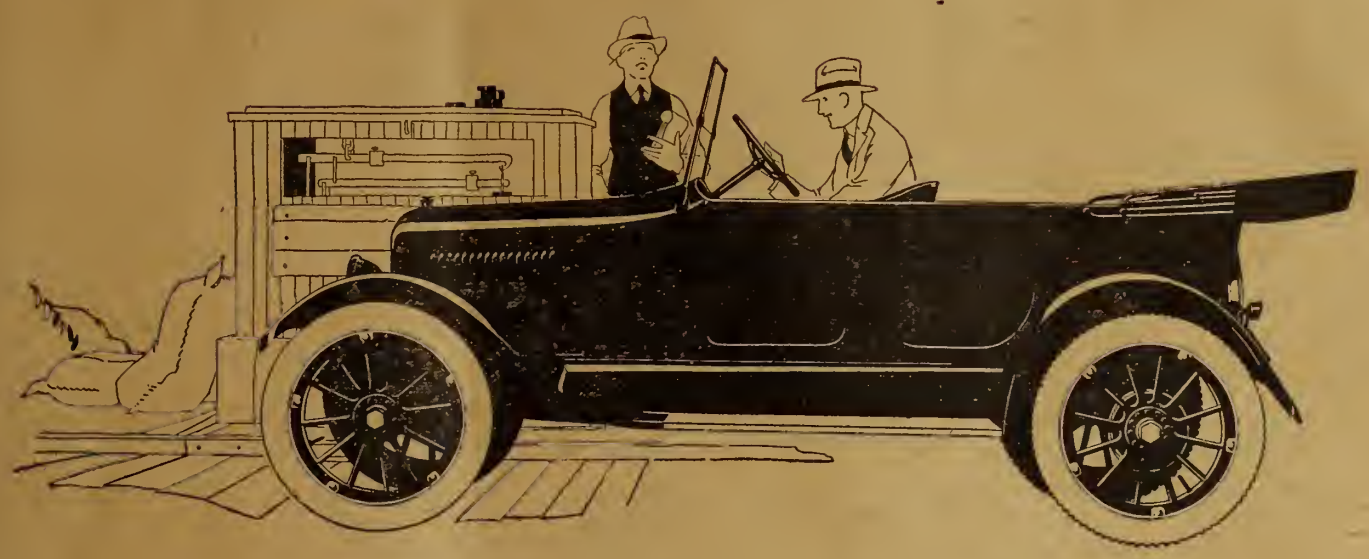
Overland

TRADE MARK REG.



Comfort That Scales Cannot Weigh

DRIVE the new Overland on the scales and you discover the light weight of its easy-to-handle, 100-inch wheelbase.

Ride in it over rough roads and you find the unusual comfort of its 130-inch **Springbase.**

Heretofore your choice was limited to either heavy car expense or light car discomfort.

But now **Triplex** Springs permit the building of this new type of light car with all the advantages of economy in fuel and tires.

They also give this new Overland that long sought comfort on all kinds of roads, which has come as a real boon to motorists.

Examine its bright enamel finish which resists the attacks of sun and rain.

Then note its complete equipment with electric starting and lighting and rain-vision windshield.

Being a car that is not confined in its use to improved roads, the new Overland will aid in the development of new farming country.

The new Overland is a tribute to Canadian manufacture. It is built completely in Canada and is peculiarly suited to the needs of the Canadian farmer and ranchman.

See this car at your earliest opportunity.

ON THE JOB!

When the man at the head of a business is always on the job, keenly alive to business opportunities and the chance to do shrewd buying and profitable selling, he keys up every man in his employ. The "Boss" who trains his men to keep their eyes open for his benefit must also be prepared to act on their information.

As an example: A cargo of leather was recently lying at Halifax subject to forced sale. A traveller for Clark Bros. Ltd., St. Stephen, N. B., so informed the firm, and as a result Mr. John F. Clark, general manager, paid a visit to Halifax. He bought the entire cargo at far below market price, shipped it to St. Stephen, and then journeyed to Toronto, where he placed an order with ONE firm for $60,000 worth of shoes to be made from this happy purchase of leather.

We will be pleased to tell you more of this enterprising firm, and of their new issue of eight per cent. preferred stock, which we are undertaking to sell after a thorough investigation of the values, purpose, products and people behind the invehtment. Free from normal income tax and fully protected by insurance in the lives of the principles.

J. M. Robinson & Sons

Artistic Roofs

for Beautiful Homes and Public Buildings

An added touch of beauty and a distinct "individuality" is given to the home roofed with Brantford Asphalt Slates.

The crushed slate surface of brownish red or dark green is not only beautiful to the eye; it is also fire-resistant.

Sparks from railroad engines or from chimneys, falling on

Brantford Asphalt Slates

are harmless and die out immediately.

This roofing is used on railway stations, one of which is illustrated here.

What is safe for a railway station is doubly safe for a home, a school or a public building.

And Brantford Asphalt Slates are the durable, economical, satisfactory roof. They will not crack, curl, rot or blow off. Easily and quickly laid.

Two sizes: *STANDARD* Slates, 8 inches x 12¾ inches, Brantford Asphalt *SLAB* Slates, 32 inches x 12 inches, four standard slates joined together. This is the newest idea in roofing. It saves time, labor and nails in laying.

Write for our booklet "Permanent Roofing Satisfaction" and get complete information.

LIVE STOCK NOTES

he following table shows the re- e number of live stock exported Canadian Stock Yards to Un- States points from January 1st ay 20th of the present year and esponding period of last year, ac ing to the returns of the Live k Branch.

here was a falling off in exports cattle during the present year unting to 63 per cent. The heavi- decreases occurring in mature le. Exports of calves were only tly shaded from those of last r.

xports of sheep and lambs de- ed by approrimately 42 per cent. mong the chief factors influencing reduction in trade were the ex- ionally high costs and the inter- nce with the movement of roll- stock on account of the strikes. strikes practically paralyzed the rican cattle markets, and killers bought in meagre quantities. The suspension, however, gave American killers an opportunity to get rid of heavy accumulations of frozen stock. This fact augurs well for killing demand at American points from now on.

On the other hand, it is reported that feeders sustained tremendous financial losses and it may be some time before buyings of this class of cattle are resumed to any appreciable extent on United States markets.

Exports to United States Points from January 1st to May 20th

	1919	1920
Calves	5329	6019
Bulls	459	23
Heavy Steers	79	118
Butcher Cattle	39271	10301
Stockers	2177	2572
Feeders	18033	4976
Cattle	65348	24009
Sheep and Lambs	7878	4535
Hogs	980	....

Stocker and Feeder Movement to Country Points in Canada

Comparing the return of stockers and feeders during the periods mentioned above, it is found that there was a decrease during the period of 1920 amounting to 41 per cent. The decreases were all made in the lighter classes of cattle. Exports of the heavy feeders show a slight increase The reduction in purchases is attributed largely to the trying experiences of feeders during the past Winter and the backward condition of pastures during the Spring.

It is anticipated, however, that as soon as the pastures have become well established there will be heavy shipments made in an effort to restock.

	1919	1920
Stockers	50268	25451
Feeders	7712	8848
Total	57980	34299

—Live Stock Commissioner

A NEW POULTRY BOOK

A new book on Poultry, entitled "Canadian Farm Poultry," has just been published by Macdonald College. The book is replete with practical information and should be of considerable help to those who keep chickens.

The more important phases of the Poutry Industry dealt with, include:

Breeds of Piultry suitable for the production of eggs and poultry meat

The selection of layers, and breeding for egg production.

Producing and shipping hatching eggs.

Incubation.

Brooding and Rearing.

Fattening all classes of chickens.

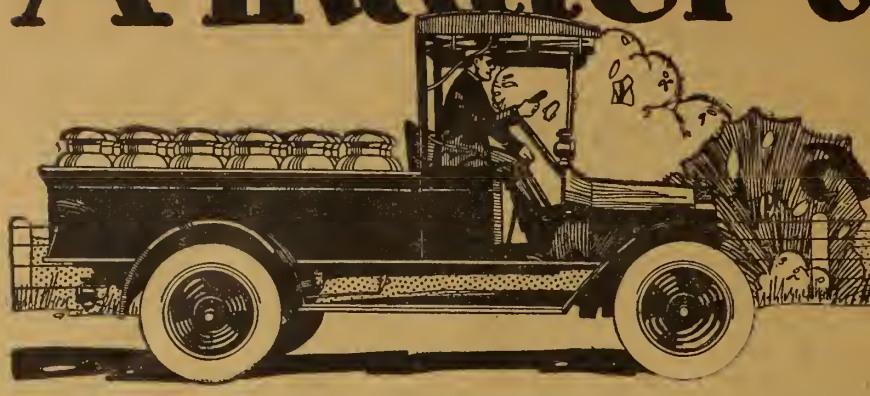
The marketing of poultry and eggs.

Preserving eggs.

Hygiene and Sanitation.

The book may be secured by sending 50 cents to The Bursar, Macdonald College, P. Q., in stamps, or money order.

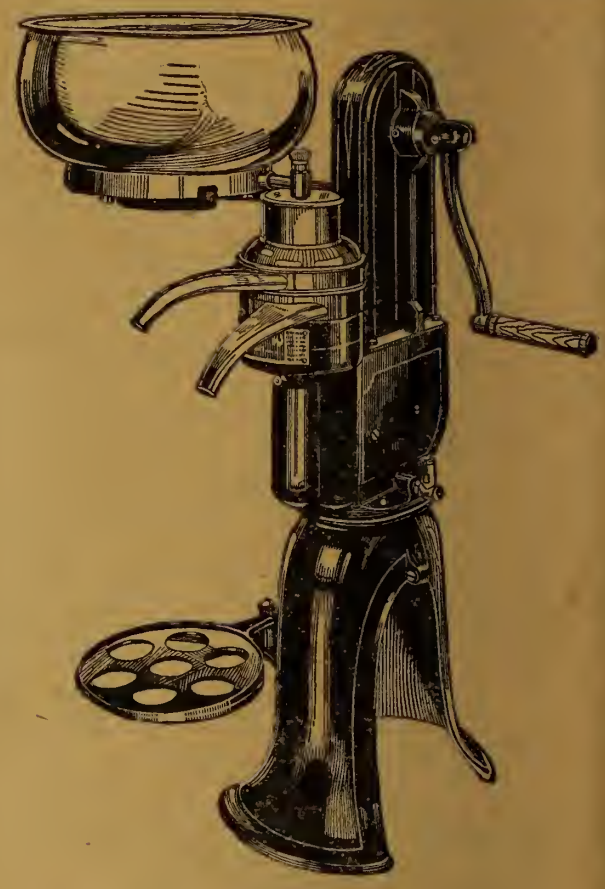
A matter of Dollars and Sense



THOUSANDS of dollars are lost by Canadian farmers through the use of poor separators.

With butter selling between 60c. and 80c. a pound, it does not take long for a poor separator to lose enough butter fat, from an average herd of cows, to pay for a good machine.

In various Tests made at Government Dairy Schools the



Renfrew

Cream Separator

has demonstrated that it gets 99.99% of the cream out of the milk.

So it is a matter of dollars and cents in extra "butter money" for the farmer to use the Renfrew, because it saves him real "cream money" that would otherwise be thrown away in the skim milk.

Easily Cleaned

All the parts of the bowl, the supply can and the spouts are made of highly polished metal. There are no rough corners hard to get at. Every part is readily accessible and can be easily scalded and rinsed.

The working parts are enclosed in a dust-proof and oil-tight casing. No dust or dirt can enter into the gears. As all the gears run in a bath of oil in this oil-tight casing it is only necessary to oil four times a year.

No oil can ever leak out on to the frame of the Renfrew Separator and then on to the floor. Think what this means in cleanliness!

A Money Maker For You

The Renfrew Separator will save you more money than any other machine used on the farm because it gets all the cream and saves much time and labor.

Write to-day for "Booklet" on the Renfrew Separator—"the all-Canadian Separator." *Buy Canadian made goods to keep Canadian money for Canadian trade.*

Farm Boys Achieve Distinction Everywhere

Are we to Believe That These Splendid Types of Manhood Degenerate After Leaving the Farm ? Are They to be Despised and Condemned Because of Success ?---It's too Narrow

When a boy leaves farm life, takes up new work, and succeeds does he become an undesirable citizen?

That is a question which the Maritime Farmer would like every father and mother, resident of the farms of the Maritime Provinces to weigh well.

Possibly YOUR boy is no longer on the farm. He may even be engaged in manufacturing, a lawyer, a merchant, an eminent practising physician or surgeon, an eloquent divine, a scholar, a professor noted for his special qualifications as a teacher, or he may have entered upon any of a thousand and one avocations which are open today to young men who are ambitious to attain success.

So the Maritime Farmer asks you as a parent do you really believe that because YOUR OWN SON has won a place for himself, he should be denied entry into any organization which he might choose to join, providing that the society is general in its scope and seeks the greatest possible measure of public support?

It seems to be reasonable that the society should be glad to welcome him. But that is not so in the poiltical organization which is being engineered from Winnipeg among the farmers of this province. THEY WANT ONLY FARMERS, THEY SAY, AND THAT VERY PLANK IS ONE THAT CONDEMNS THOUSANDS OF DESIRABLE FARM RAISED BOYS FROM PARTICIPATION IN A MOVEMENT, WHICH TO BE NATIONAL OR CANADIAN MUST BE OPEN TO ALL.

Let us look the situation over. May we be permitted to speak of the case of possibly your boy, or at least your neighbor's lad. In any case you know him. He is now, perish the thought, a manufacturer. He left the farm to make his own way in the world. Probably he took the train for the city at a time when butter in the Maritime Provinces sold for 15 cents per pound, potatoes for next to nothing, eggs for eight cents per dozen, poultry was bringing from 30 to 50 cents per pair, apples went to England and did not always pay for freight and expenses, strawberries sold for six cents per quart, delivered at the selling point, with equally low prices for everything sold from the farm. Any person forty years of age can well recall those conditions, when farm life was hardly what it is today. Well, with more boys at home than such prices would maintain, John went away, to make his way in the world.

You remember him. He was a worker. He was a thoughtful boy and a pretty fair student. His habits were good and the neighborhood regarded him as a young man who would make his way in the world. So to town John went and like many another lad before him, he took the first job that came to hand. As this is not a novel, we leave the reader to fix the job to suit his own hero. But whatever the work was, it was well done and in the course of time John won out out and became of such value to his firm that now he is "the firm." Never in all those years has he lost sight of the old folks, "back on the farm." He visits them and he helps them and he has been generous to his home community, and he has lost none of the qualities which his mother loved him for. In fact he is highly thought of where he lives and "where he formerly lived."

Just a little story of a couple of parishes in New Brunswick. From one came four boys. One was the governor of this province, (a manufacturer too); one a member of the Dominion Government; one a leading divine and professor; and the fourth an eminent preacher. All four were from the farm. All four had to fight hard for success, and all won it.

Another little village has given a chief justice, a cabinet minister and a governor, and a host of other men who are looked upon as being citizens of merit and worth. They were all FARM boys. But they had to go out in the world and win their way. Today they are mentioned with pride in the places of their birth, and boys in their teens are reminded that what these men accomplished, they, too, can achieve.

And yet, the farmers of these provinces are asked to regard these outstanding examples of what the farm can produce, as men who are not eligible to sit at table with their families or their old and tried friends. They have left the farm. Therefore, we are told, have done with them. If they are getting along in the world, they are profiteers, they are robbers. They were decent boys, they came of decent parents, they are still so regarded by their neighbors, who know them best, but you are to be taught to regard them as something undesirable in the land. Their splendid qualities as they appeal to you, who know them best, are derided and represented as something to be regarded with suspicion or worse. We ask you if, away down in your heart, you believe that sort of thing.

We know there are those who thrive on denunciation of everything that is decent and worthy of praise. These people, who possibly have never accomplished anything, can always instruct their neighbors. How many times do you see it that some fellow, who talks so much and so long that his own farm is a sight to make angels weep, can always tell the other fellow just how this should be done and how that should not be done. And they, in large measure, are the very persons, who decry the good qualities of your boy and would erect between him and you the "highest fence" that can be devised.

The Maritime Farmer has asked the question of hundreds of farmers, "Do you believe 'So-and-So,' with whom you went to school, is an object of suspicion, because he succeeded?" And an emphatic "NO" came back with a snap. Then your friend tells you all about "Bill" or "Jack" or "Tom" and how he is "just as he used to be." There is no use in trying to convince anybody in that section that 'So-and-So' is a crook and an undesirable citizen, somebody the farmer need fear and avoid. That is because 'So-and-So' is known. But his type in another section, (just the same kind of a chap) is held up to some other place as a monster and a degenerate, a crook, a robber and a citizen concerning whom nothing too bad ran be alleged. That sort of campaign is being carried on consistently and thoroughly. It is as narrow as the men who conceived it.

The Maritime Farmer believes that there is an opportunity for the farmers of the Maritime Provinces to organize in a way that will make this part of Canada stand for something. We should be all pulling together. Just as it is we get nothing. Thousands of immigrants pass through these provinces from Europe, who have never been advisd that there was such a place. Millions are being spent to attract population elsewhere Our boys are won from us by so called "harvest excursions' and propaganda, the unsoundness of which is only realized after costly experience. We are told by western politicians that not only have we no claim for compensation for western natural resources, in which we are shareholders, and which is is proposed to hand over to others, but that EVEN OUR CLAIM AND OUR SIDE OF THE STORY SHOULD NOT BE LISTENED TO. And yet we are asked to divide our strength, to adopt a class system. We are invited to join hands with the peasants of Austria and Russia, to take to our bosoms tens of thousands of foreigners (nationalized in name only), to look lovingly upon thousands of American farmers who have settled in the West, as brothers, and at the same time to regard our own FARM BOYS, SUCCESSFUL IN OTHER WALKS OF LIFE, AS UNDESIRABLE CITIZENS AND DANGEROUS TO THE FARM LIFE OF THIS COUNTRY.

THE MARITIME FARMER HAS BEEN ACCUSED OF TRYING TO DIVIDE THE EAST AND WEST. NOTHING TO IT. BUT WE DO CONDEMN A LINE OF POLICY WHICH TEACHES THAT THE VERY BEST PRODUCT OF OUR FARM LIFE IS SOMETHING TO BE SHUNNED AND DESPISED AS SOON AS IT LEAVES THE FARM, AND THAT THE REFUSE OF EUROPE SHOULD BE PREFERRED TO GOOD CANADIANS AND OUR OWN FLESH AND BLOOD.

We say again, think it over. Make up your mind if you have come to the stage when you are disposed to regard all men, not farmers, as citizens with whom you have nothing in common. Their blood tie should be their highest recommendation. You know them. Do you think of ALL of them as you are invited to regard them?

One of the chief advocates of dividing the farmers from their own flesh and blood is J. J. Morrison, Secretary of the U. F. of Ontario. On May 27th Premier Drury and the United Farmer members of the United Farmer party in the Ontario legislature, with the exception of ten members refused to be dictated to by Mr. Morrison and passed legislation, which that gentleman tried to defeat from outside of the legislature. The farmers of Nova Scotia, New Brunswick and Prince Edward Island should realize that they are competent to run their own affairs. The Maritime Farmer is prepared to back them to the limit in that worthy object.

HOW AUTOMOBILES HAVE INCREASED

Automobile registration in Canada go ahead by leaps and bounds, and already thousands of motor licenses have been issued in the several provincs for the current year. With so many farmers buying automobiles and trucks, 1920 is expected to be a record in the trade and eclipse all previous years by many thousands.

The growth each year in Canada since 1907 is indcaited in the following table:

1907	2,100
1908	2,939
1909	4,711
1910	8,937
1911	21,682
1912	34,789
1913	50,489
1914	67,415
1915	87,675
1916	120,368
1917	199,302
1918	267,408
1919	334,190
1920 (estimated)	395,000

Notes From the Nova Scotia Agricultural College

THE MARKETING OF WOOL

Arrangemens have now been completed for the marketing of this years clip in Nova Scotia, through the Canatdian Co-operative Wool Growers, Ltd. There are to be three collecting stations, one at Port Hood, in charge of Mr. D. F. Fraser, one at Antigonish, in chrge of Dr. Hugh McPherson nd one at Truro, in charge of Mr. L. W. Black.

The first step to be taken in order to take advantage of this organization is to procure from Mr. Black at the Agricultural College, Truro, a supply of paper twine for tying up the fleeces. This twine costs 40c per lb, plus postage. There is sufficient in a pound to tie up forty fleeies. The following directions for tying and shipping will be found useful, and should be followed as closely as possible.

Have the shearing floor clean and free from chaff and seeds. Keep the fleece intact as much as possible, and when taken off the sheep spread out carefully on the floor, skin side down Fold in the two sides to a width of twelve to fourteen inches, then roll from the two ends to the centre and tie with paper twine. If you have a wool box and can tie with that, it is still better.

Place tags on inside as well as outside.

The receiving stations mentioned above will be ready to receive wool after June 15th and up to July 15th. The packages must be addressed to the person in lharge at the station most convenient to the shipper. The names are given above. Freight charges are paid by the buyers, and deducted from the price to be remitted. 25c per lb. is remitted when the wool arrives, and the balance after it is graded. The final price cannot be guaranteed beforehand, but will be the highest possible for the grade.

As a criterion of the price to be obtained last year's experience may be cited. 35c. was paid on arrival of the wool, and when the wool was sold about an equal amount more was forwarded. In general, those who marketed throogh the Canadian Co-operative realized aboot 40 per cent more on their wool than those who marketed in the old way. While there can be no guarantee given of corresponding prices this year, yet those who market through this agency may depend upon getting the very highest prices the market affords.

Last year Nova Scotia marketed through the Canadian Co-operative Wool Growers, Ltd., 111,377 lbs. of wool. Of this amount 103,649 lbs. was graded in the combing classes, medium to low, all of which brought the highest prices, leaving less than 8,000 lbs. of the coarser and poorer qualities, which brought somewhat lower prices.

One of the great advantages attained through the co-operative marketing of wool is that a premium is placed on the better quality over the poorer. It is anitcipated that this year the better will bring 20c. per lb more than the inferior qualities. The main considerations in producing a good fleece are—good regular feeding; keeping sheep in pastures free from burrs; and feeding hay in racks in winter, so as to prevent the chaff material from being imbedded in the fleece.

If further information on any matter in this connection should be desired, communications may be addressed to Mr. L. W. Black, Agricultural College, Truro.

NEW ASSISTANT DAIRY SUPERINTENDENT FOR N. S.

Mr. W. J. Bird, who was Assistant Dairy Superintendent in Nova Scotia during 1915, has been appointed to the same position recently and will take up his duties at once. Since 1915, Mr. Bird has served three years overseas, and on his return completed the course for the B.S.A. degree at Guelph, Ont.

During the past two years the position of Assstant Dairy Superintendent has been ably filled by Mr. R. B. McLennan of Brookfield. Mr. McLennan resigned some weeks ago to take up a private creamery business in Truro on a large scale. His successor is well equipped both by training and practice to continue the good work in association with Mr. W. A. McKay, Dairy Superintendent for Nova Scotia.

GROWING SUNFLOWER FOR SILAGE

A field of an acre and a half at the College farm has this year been sown to Russian Sunflower as a silage crop Reports from tests in other places indicate that this crop is not liable to injury by frost as corn is, and that it yie'ds a larger amount of succulent feed per acre than the O.P.V. mixture. It is largely grown in the mountainous districts of Colorado and in some parts of the Canadian West. It has also been tried out at the Mt. Cameron Farm, St. Francis Xavier, Antigonish, and reports from there state that the yield was large, that it made a very satisfactory silage, and that cattle ate it well. The results of this test at the College farm will be watched with interest.

METHODS AND RATIONS USED BY THE POULTRY DEPT., N. S. A. C.

Such phenomenal success in egg production has been reached by the Poultry Department at the Agricultural College, in the Egg Laying Contest now well along, that numerous enquiries are being received as to rations and methods employed. In response to these a circular has been issued, which runs as follows:—

The following methods and rations are being used by this department in rearing young chickens. They are giving good results where used properly. Don't pull off foolish stunts and then complain of hard luck and bad luck with little chickens.

Do Not

feed your little chicks until 48 hours after hatching. This alone will save the lives of many chickens

Make Sour Milk

the first feed. It will pay to feed milk to little chicks.

First Week

feed five times per day of fine chick grain on clean boards. Rolled oats and dry bread crumbs may be used. Provide clean dry sand and cut straw or clover leaves on floor of brooder. If no chick feed is to be had, make a mixture of equal parts of fine cracked corn, wheat, pin head or steel-cut oats and add 5 per cent of millett seed and broken rice.

Do Not Overfeed

Put on the boards just what the chicks will eat in 5-10 minutes. More chicksk are done to death by overfeeding than are starved to death.

Second Week

substitute dry mash for two of the feedings, once in the morning and once in the afternoon. Use shallow boxes or feed boards for the mash and provide ample feeding boards for the chickens. Begin with 15 minutes feeding periods and when three weeks old leave mash before chicks all the time.

For Dry Mash Use

2 parts (by weight) Bran, 2 parts corn meal, 2 parts oatmeal and 1 part fine meat scrap. Keep some fine grit or sand, dry ground bone meal, fine charcoal and water or milk always available. After the first week get the little chickens out on to the ground for a short time each day.

Feed some raw vegetables finely chopped or get the chicks on grass plots after the first week.

When sex can be distinguished separate cockerels from pullets. Give pullets free range. Confine cockerels and fatten on the following ration 2 parts (by weight) cornmeal, 2 parts ground oats (hulls sifted out) 1 part ground barley, 1/2 part of meat scrap This mixture should be mixed with milk or buttermilk or fed with 15 per cent or raw or cooked vegetables mixed in the water the vegetables have been cooked in. Market cockerels as early as possible.

Open hen houses to the sun and keep them dry. Get pullets into winter quarters early in the fall. Cull all inmature pullets and send them to market.

Important

Keep healthy early matured pullets. A few well reared pullets will be more profitable for egg production than a flock of late hatched chickens.

The early pullets should lay in October and can be kept laying by good feeding and proper care during winter.

Feed for Laying Hens

Mash 100 Bran, 100 Cornmeal, 100 Gluten, 150 Ground Oats, 100 Meat Scraps.

Feed dry in large hoppers so as to be available to the birds at all times.

Grain—Equal parts of wheat and corn in winter and in summer 2 parts of wheat to 1 part of corn (cracked).

Count the hens in the pen and feed 2 ounces of the mixture for each hen in the pen per day. This should be divided into two feeds morning and night. At noon feed boiled vegetables dried up with wheat middlings. Allow the fowls to eat what they wish for 10 minutes each day and remove any feed that is left. Keep grit, oyster shells, charcoal and clear water in clean dishes before the fowls at all times. Feed skim milk whenever available. Always provide some green vegetables such as cabbage, mangles, turnips or sprouted oats. During the breeding season do not use vegetables too freely.

Mate 10-12 hens to a vigorous male to insure good hatching eggs.

Use good wholesome clean grains for poultry feed. Musty grain will cause sickness and loss in the flock.

Tack this up in your hen house and read it often. If you want another or your neighbor wants a copy address: Manager Poultry Department, Agricultural College, Truro, N. S.

CUT OUT THE BLUFF

The Maritime Farmer Holds Itself Responsible for all of It's Statements--This Paper, Like Others, is Answerable for It's Articles--A Big Bluff Called

In its issue of May 25th, The United Farmers' Guide manfully states that it has taken over the troubles of the Grain Growers' Guide and its editor, Mr. George Chipman, and offers the Maritime Farmer One Thousand Dollars, if the said Maritime Farmer will appear before Four Sussex Lawyers and prove statements made by this paper in its issue of March 2nd last.

The United Farmers' Guide in referring to a somewhat similar offer of this paper, says it is "stupid." We realize that. We realized that when we made it. But we deliberately made the same kind of an offer that Mr. George Chipman devised, and so we simply imitated that gentleman's stupidity. We claim no credit for originality or for any desire for credit. When Mr. Chipman made his offer, he knew he was putting something over that is much older than he is, and something that he has described very accurately as "stupid." We are glad Mr. Chipman recognizes his child. So far as the United Farmers Guide offer is concerned, may we say that we prefer to deal with the principal owners of that paper, The Grain Growers' Guide, Winnipeg.

The statements of The Maritime Farmer are declared to be "cowardly and unscrupulous" falsehools. If they are then there is one place to so stamp them. That place is the properly constituted law courts of the country. The Maritime Farmer is prepared to defend its statements at all times, and the Grain Growers' Guide is at liberty to start in at any time. The jury will be composed of farmers in most part. The Maritime Farmer is willing to abide the issue.

The Guide also ventures to read a lecture on the ethics of journalism to this paper. May we say that such a lecture comes with bad grace from Mr. George Chipman, a man whom this paper in its issue of March 30th denounced as a common blackmailer. Mr. Chipman, it will be remembered tried to blackmail the manufacturers of this country in an effort to secure funds for carrying on the propaganda of "Western Farmers." Possibly Mr. Chipman is today spending some of that very money, supplied by these big interests, in his extended tour of the Maritime Provinces. So from that souruce the Maritime Farmer needs no lecture, no lesson.

We did not publish a letter from Mr. Chipman, because Mr. Gordon Sharp, at a meeting at Fredericton, lied deliberately in a statement made concerning this paper's treatment of a letter from Mr. Norman Lambert. We agreed to publish it. Mr. Sharpe was sent to Fredericton to say we refused publication, despite the fact that Mr. Lambert had in his possession a letter giving him the date of publication. The letter was published as agreed. In view of such remarkable conduct, The Maritime Farmer declines to have anything further to do with such men, until Mr. Lambert has the ordinary decency to explain why Mr. Sharpe was sent to make that statement under the circumstances. From men of that stamp this paper proposes to take no suggestions as to decent journalism. They hardly understand the term.

An average of $840 was realized on 40 females at a Shorthorn sale held at Worthington, Minn., on April 8, by Andrew Olson. Three thousand dollare was paid for Clara 61st, a yearling, and Northcote Rosemary 2nd, with a heifer calf at foot, sold for $2,575, and Village Lady, with heifer calf at foot, for $2.500.

Notes From Prince Edward Island

DAIRYING IN P. E. ISLAND

Recognizing the value of dairying to this Province, and realizing the necessity of improving the production of the individual cow of the average herd, the Department of Agriculture has inaugurated a series of competitions to demonstrate the value to the farmer of learning the relative production of his cows. Heretofore the premium offered in dairy competitions were in the form of small money prizes, which were not sufficient to bring out a large entry, and the premiums when disposed of are forgotten. Believing that a well bred heifer calf would prove a permanent demonstration of the advantages of better breeding and feeding methods, and be of benefit in assisting those who have never realized the advantage of better breeding to undertake the improvement of their herd by the introduction of better females to take the place of the poorest cows, discovered through the medium of the individual testing method to be adopted by those entering tbis contest, it is now proposed to offer tbirty high grade heifer calves and yearling heifers and two pure bred bull calves as premiums to the Managers of our cheese and butter factories, making the largest proportionate increase in quantity and in quality over last season's make.

Desiring to give the greatest assistance to the small producer in districts where cheese and butter factories operate only five months a year, 50 per cent of the $1000.00 offered will be divided into thirteen prizes, in this class, open only to grade cows. Beginning with $40.00 value for the first prize and reducing each successive prize $2.50 until the thirteenth prize of $10 is reached. A pure bred bull calf to the value of $100.00 will be awarded to the factory winning tbe greatest number of prizes. A competitor owning one or more pure breds is not barred from entering the balance of his herd.

In Class II. $375.00 value in heifers is offered for grade herds only throughout the province, and is one year in duration beginning June 15th 1920 to June 14th 1921. Seven prizes will be awarded with conditions simllar to Class I. A pure bred bull calf of any breed to the value of $100.00 will be awarded to the Factory winning the greatest number of prizes. The desire of the Department is to demonstrate the value of pure bred and selected males, as well as to stimulate as large an entry as possible from eoch district.

Class III. offers $175.00 and is for all herds in the Province including pure breds, mixed and grade herds and is for one year in duration. Seven prizes will be awarded, beginning at $40.00 with conditions similar to Classes I and II.

In this way it is hoped by inducing each man to work individually to win a premium and collectively to win a pure bred bull calf for their district and with the maker also interested, we should considerably increase the made and demonstrate the value of the individual cow testing.. It is found in every herd where individual records are kept that there is a great differense in the producing ability of the different cows, and if a competitor with a herd of four or more cows learns at the conclusion of the contest that he has lost a position by having one cow producing ten to twenty-five dollar less value than another in his herd he will see before entering any further competitions that this animal is replaced by as large a producer as he is able to secure.

The average production of all dairy cows in this Province is not over 3,500 pounds of milk a year, while many of our good grade herds are producing an average of 10,000 lbs. as shown in the records of our cow testing association. If the average of the 40,000 dairy cows owned and fed in this Province could, by better breedng, feeding and selections be increased to even 5,000 pounds it would mean estimating this increase at two dollars a hundred an addition al value of $1,350,000 to this Province without any added cost. Each competitor must enter his cows in the cow testing association, weigh his milk every ten days, morning and evening, or three times a month and take a sample at each milkking in bottles provided free of cost. Testing will be done by an official of the Department. and at the end of the competition he will be able to learn what each one of his cows has produced. The knowledge gained will be of much greater value to him than the small amount of time necessary to attend to this work, and he will soon discover that whatever average grade his cows may be if the entire stock were equal to the best one his return would be materially greater. Dairymen, many of whose cows now average $200.00 each a year, find that they cannot afford to neglect the work. It is the only way that they can discover which of their animals are the best producers, those that they should retain and whose heifer calves should be reared to further improve to all competitors. This nformation secured by the Department will be of great benefit in showing what improvement it is possible to their herd. This demonstration obtain by starting with the commonest herds of the country and in a business-like manner learn their comparative production, and breeding up by the use of pure bred sires, high class producing herds.

In this way it is hoped to extend the methods that have brought the most productive districts in this Province to their present condition.

Every farmer who has sons would be well advised to allow and encourage them to enter their herds in com petition, and give the heifer won to the boy. The Department will select as good individuuals of the breed chosen by the distrct as can be purchased for the sum allotted for each prize, and gve the premium to the competitor as soon as it is possible to secure a suitable individual.

COMPETITIONS FOR THE PROMOTION OF DAIRYING ON PRINCE EDWARD ISLAND

The Objective

The principal object of this series of competitions is to place an opportunity within the reach of every Dairyman of the Province by which he can receive assistance towards the improvement of his herd.

Dairying has long held a prominent place with the Agricultural Industries of P. E. Island, and during late years it has rewarded the Dairy farmer with handsome profits. Its prospects never were brighter than today. Markets are broader, quality is the watchword and prices though variable at best promise to maintain a higher level than was ever anticipated by the most optimistic observer

The Dairyman who has made the most of his opportunity is the one who has given the greatest amount of attention to the producing end of his business, THE COW. Individual Milk Records, the use of a Pure Bred Sire from high producing animals, and the consequent careful selection of future milk producers and breeders involves an amount of work and attention that cannot be eliminated, but each in turn pays its own dividend.

With a view to giving encouragement and assistance the Department of Agriculture has allotted the sum of one thousand dollars into prizes for the several competitions. A part of the prizes will be given in the form of thirty high grade yearling or heifer calves and two pure bred calves of any breed.

The Classes are arranged to give particular encouragement to the Dis tricts which have not up to the present specialized in Dairying, and to permit every man to enter a competition against Dairymen of his own class.

Objects

The objects sought after in these competitions are:

1. To increase the milk production of the average Dairy cow.
2. To establish an appreciation for a higher grade of Dairy cattle.
3. To promote a more general use of pure bred sires from proven high producing stock.
4. To encourage the better care and feeding of the Dairy cow.
5. To encourage and assist the Dairy industry throughout the Island.

Competitions

Class I—($500.00) is for grade herds and open to all dairymen where factories do not operate for the full year. Records will be for 5 months duration, June 15th to November 15, 1920. All prizes will be paid in the form of high grade yearling heifers or calves, with cash values as follows:—

1st $40.00; 2nd $37.50; 3rd $35.00; 4th $32.50; 5th $30.00; 6th $27.50; 7th $25.00; 8th $22.50; 9th $20.00; 10th; $17.50; 11th $15.00; 12th $12.50; 13th $10.00

The Factory winning the greatest number of prizes will receive a pure bred bull calf of any breed to the value of $100.00, also a special prize will be given to the makers having the greatest percentage of increase in quantity and quality for the season and giving evidence of general proficiency in the conduct of their work to the value of:—

1st $25.00; 2nd $20.00; 3rd $15.00; 4th $10.00; 5th $5.00.

Class II—($375.00) is for grade herds throughout the Province and is one year in duration from June 15th 1920 oo June 14th, 1921. Seven prizes will be awarded with conditions similar to Class 1 as follows:—

1st $40.00; 2nd $35.00; 3rd $30.00; 4th $25.00; 5th $20.00; 6th $15.00; 7th $10.00.

A pure bred bull calf of any breed and to the vaule of one hundred dollars will be awarded to the Factory winning the greatest number of prizes.

Class III—($175.00) is for all herds of the Province including Pure Breds Mixed and Grade herds, and is for one year in duration, June 15th 1920 until June 14th 1921. Seven prizes will be awarded with conditions similar to classes one and two, as follows: —

1st $40.00; 2nd $35.00; 3rd $30.00; 4th $25.00; 5th $20.00; 6th $15.00; 7th $10.00.

Class IV—($50.00) is open to the cheese and butter makers of the Province who operate during the entire year. Judgment will be based on the percentage increase in quantity and quality and general proficiency. Prizes will be to the value of:—

1st $20.00; 2nd $15.00; 3rd $10.00; 4th, $5.00.

Regulations

1. All prizes will be awarded on the basis of the greatest average pro duction of butter-fat per cow, as computed by the cow testing Association.
2. Every competitor must keep individual Dairy Records according to the regulations of the cow testing association, which includes weighing and sampling milk, at each milking, or three regular days per month.
3. The Supervisor of Dairy Records, the Dairy Inspector, or an authorized official of the Department of Agriculture will have the right to call at any time to weigh and sample the milk of the cows entered for competition.
4. A competitor in classes one and two must enter his entire herd (excepting pure breds in classes one and two. A herd must be composed of four or more cows.
5. Class three is open to any herd within the Province.
6. A cow freshening within one month after June 15th shall be included in the herd for Class one, and one freshening three months after June 15th shall be included in the herd for classes two and three.
7. If a competitor loses a cow or her yield is materially diminished by an accident or sickness she may be withdrawn from competition on the recommendation of an authorized Inspector of the Department of Agriculture.

SHELL MUD

Prince Edward Island is very fortunate in having extensive deposits of oyster and mussel shells in the bays and ripers throughout the whole province.

In the early days these shells were lifted at low tide during the summer and spread over the fields for fertilizer or burned to secure lime for plastering.

The top layers of many of these deposits were composed of blue mus sel shells in the various stages of decomposition. This mud was found to be very valuable when applied to new land or land requiring lime. Ingenious farmers soon invented and constructed mud-diggers of different types, but all efficient for lifting the deposits. Some of the first ones were mounted on scows, but the general practice of liftng mud thirough the ice in winter was soon adopted, and most of the surface deposits of mussel-mud were quickly exhausted. Underneath these there were deep deposits of oyster shells and in other places extending from near the surface at low tide, to a depth of over 20 feet almost pure oyster shells mud was found. These have all received the general name of Mussel-mud after that first used. Large quantities have been lifted at points such as Bedeque Bay and St. Peter's Bay and shipped inland by rail. A dredge has been employed for several summers at the latter place by the Provincial Government, and the mud shipped to ocalities in need of this fertilizer.

The first application of shell mud to land not previously mudded invariably is most beneficial. It is scarcely ever known to fail to produce most luxuriant crops of clover, following increased root and grain crops. These muds are essentially lime fertilizers usually containing 85 percent. or over of carbonate of lime with traces of nitrogen and phosphoric acid. They are usually piled on the shore or in small heaps in the field and exposed to frost which breaks down many of the shells before being spread on the land.

Farmers living near the deposits applied very heavy dressing in the early days. It was found when this was done and a second application made after a few years that very little benefit resulted from a second application. It is generally considered that a carload of 12½ tons is a good dressing for an acre. The price for many years was $3.50 per car at the point of shipping. This was advanced to $8.50 and at the present time $14.00 per car is quoted at point

Supreme Revelation, Divine Command, Sublime Incentive

Rev. R. M. Bynon's Annual Sermon to Fellow Agriculturists.---City and Rural Conditions Contrasted

The following is the sermon delivered by Rev. R. M. Bynon in the Lewisville United Baptist Church on Sunday afternoon, May 16th, before representatives of Boundary Creek, Coverdale, Fox Creek, Harrisville, Irishtown, Steeves Mountain and the Gorge Agricultural Societies and many others.

"He hath shown thee oh man what is good and what doth the Lord require of thee but to do justly, love mercy and walk humbly with thy God." Micah 6:8.

It is a peasure to meet with you today, to recognize and acknowledge our dependence on the Great Supreme. It is fitting that you who to day are the most independent of men should have a recognition service of your entire dependence on the Divine. We meet today on this exalted platform regardless of at what shrine we worship or by what name we are known, servants of none, dependent on none, coerced by none. We plow, plant or sow depending alone on the Eternal, the giver of every good gift who never fails. Here we erect our Ebenezer "Hitherto hath the Lord helped us."

When twenty years ago I preached my first farm sermon I spent the first five minutes defending my doing so, showing God planted the first garden, agriculture was man's first vocation that most of the great men of sacred and profane history came from or were engaged in agricultural pursuits. Gideon threshing grain, Elisha from the plow, Cincinnatus at his farm, David among his sheep, Cromwell in the flats of Huntingdonshire or Washington on the plantation in Virginia, or the spotless, peerless, immaculate incarnate Christ of God using trees, seed, sower and soil for miracles, parables and sermons. Today it is superficial to linger here. Only the ignoramus would question our thus meeting. The world war has demonstrated of all material vocations, farming is the most essential. If today all earth's provisions were equally divided there would not be enough to last 12 weeks. If farmers went on strike for three months strikers would strike no more.

We honor the splendid men who went forth with life in hand to break the power of the oppressor; men who wrote the name, fame and glory of Canada in letters of blood. Across a world horizon now a more colossal task confronts us; construction is greater than destruction; to produce and save is greater than invent and destroy. Millions of starving women's and children's mute appeal calls from far across the wave for succor we alone can give.

Three Thoughts Suggested

My text to me suggests three thoughts: A supreme revelation; a divine command; a sublime incentive

1.—Supreme revelation. "He hath shown thee O man what is good." God the Eternal created man in his own image and breathed into him the breath of life. By this inbreathing, of Jehovah man is lifted above all other created things, stamped with the image of his maker, possessing personality, conscience, affection reason and will. Through these God by his ordained agents, makes known to man heavens' mandates that we may atune our lives to His will in nature and grace.

It is good to be optimistic; as we live this May day near to nature's heart to see each bursting bud, each fragrant flower, each singing bird, proclaim our Creator's love and care It is good we should realize the bless ing of living in this land of plenty un der the protection, freedom, justice, honor and light of the old Union Jacn and that of all the fair domains o'er which it floats none is more loyal, happy or prosperous than we. It is good Labor and Agriculture should have saner views of each other's position for it is good "as much as lieth in you to live peaceably with all men." To do this we need but follow His rule: "All things ye would men should do to you do ye even so to them." The pigmy who meanders out to the farm boy to tell him of his short hours, big pay and little work, does not rightly represent the true position of Labor. The true man sweating blood in unwholesome work and foul air to make his own toll and that slackers' represents a very different side bringing to our mind the words of the Wise: "He who tilleth the soil shall be satisfied with but he who follows a vain person is void of understanding." Remember long hours in healthful surroundings with wholesome provision and good air is not always an unmixed curse. Apart from railway work and war ten are killed in off hours to every one killed at work. The characters of fifty are blighted, blasted, mildewed, damned in hours other than work to every one who falls in work hours. It is true the present labor unrest has caused much suffering. This is but the swinging of the pendulum the other way; men having time who have not trained themselves to think but we believe that time will bring the training, then when trained intelligence asserts itself, capital will receive its just consideration and labor its right reward; then shall slackers, profiteers, extremists and paid agitators receive a foretaste of their more direful doom. Farmers have suffered much by capitalistic combines and socialism gone mad yet today the farmer is the bed-rock of social order and good government. Not one of our 10,000 members would favor the black nightmare of Bolshevism. We need closer affiliation in all life's avocations especially in our rural districts. "How shall I retain the affection of my husband?" asked a young bride of an aged dame "Feed the brute," was the laconic reply. Man is more than a brute. He has a social nature and more. "Man shall not live by bread alone." It is not good for man to be alone and because he does not get the desired companionship in the country the farm is left for city life. Few young women today wish to remain on the farm. Spurgeon said "Man is the head, but woman is the neck that turns the head at will." Hold the girls on the farm and the keeping of the boys is dead easy. "I have no use for the dog-caressing, dog-clothing, dog-auto-riding dandies and kindred cousins. Solomon said: "As jewels of gold in a swine's snout so is a fair woman that is without discretion." But for the bright, honorable, intelligent woman who has no domestic task to prevent and enters office or any other honorable occupation to help bear the colossal task of keeping a home today, for her I have naught but the highest admiration. Compared wtih the useless, dueless, gadding gossiper, she is as an angel of light to a demon of darkness, and yet high as this honorable, industrious class stands they by no means reach the highest type of christian womanhood The greatest asset Canada has or ever can have is christian mothers. They are they who hold the destiny of Canada in their hand. She whose very life enters into the rearing and moulding of honest, honorable, God-fearing children must ever sit queen in the realm of heroines. Too oft in city life child life is crowded out. Ads will appear "Houses to let for families without children." Billy Sunday referring to such landlords says 'they will get a place by and by where there are no children and it won't be Heaven." Recently the young ladies of Mount Holyoke College representing some 620, mostly old Puritan homes, gleaned the following: Their great grandmothers raised an average of over six children, their grandmothers five, while in their families there was only an average of 3¼. With so many of our brightest and best young women seeking positions in office or elsewhere, with foreigners coming to our land raising children in squalor, profanity and cigarettes, whose parents are absolutely useless as citizens, we are fronted with a question that will not down—who shall grip these and thousands rushing to our Canada, coming with systems hoary with age and dark with superstition, with light regard for legal order or human life, with Bolshevik poison in their very veins? Seen from city standpoint alone there is much to alarm and cause pessimism. But the rural life in the past have brought to the fore the greatest men who have walked God's earth. On them we stake our faith that they by help divine, will hold our nation true to its highest ideals and lift the alien to a glorious future. She who raises a family of loyal, industrious, progressive children, who fear God and love their fellowmen shall praise her name, her children shall rise up and call her blessed. The late Miss Helen Gould gave $250,000 to erect a hall of fame to the honor of fifty of her nation's greatest; four-fifths of the names that grace that hall were born and reared on the farm. From our rural districts still shall come the men who shall guide our fair Dominion to recognition of equal rights to men and humble, reverent homage to God; men shall meet the oncoming thousands with the gospel of my text and win them for glory and God.

The Divine Command

II. The Divine Command—"Do justly love mercy." Consider with me the justice that has and is being done to those self-sacrificing heroines who above all others are and will make our nation great. Her city cousin works about eight hours per day five and a half days per week; she about fourteen hours per day seven days per week; the one about forty-four hours, the other about ninety-eight. The woman in other vocations usually gets two, four or six weeks vacation; she seldom a day. Many get free passes all over the Dominion on her railroad; she never. If she goes she pays her own way and has a little extra tucked on for those who go free. Other workers in most vocations, after a few years of faithful service, are pensioned. What statesman dare propound a pension for her who faithfully wrought on the farm, ten, twenty or forty years or raised and trained half a dozen whole-hearted, true-hearted, loyal God-fearing, serviceable children, and one of them worth more to our nation than a carload of foreigners. Surely "juustice standeth afar off, truth hath fallen in the street and equity cannot enter" and yet we are asked "why do our young people leave the farm?" O shame, where is thy blush.

Do justly—our schools are a festering sore, a decrying shame, a standing injustice, to every boy and girl who would make farming their life vocation. There is not in the curriculum of our country schools one text book on agriculture. Worse, men who have the power to get it there are using that power to prevent. At our farmers' association in March, re presenting more than 10,000 men, we unanimously voted a resolution requesting the Prov. Government to compel a text book on elementary agriculture in the curriculum. Such a resolution has been passed before and yet the crime continues chiefly because of opposition none of which comes from farmers. In justice to our children and country we are obligated to compel our demand. When farm ers speak today wise statesmen stop and listen; farmers hold the majority vote in this country and they are beginning to learn how to use it. If in rural schools was taught just what each plant draws from the soil, its food value for man and beast, just what fertilizer was required to change a field growing yellow weed, daisy, sorrel, etc., into a field that would grow clover, wheat, corn, etc. just how to know if soil is sour and hour to sweeten it and like useful kindred subjects a taste for scientific farming would be inculcated and would eliminate much useless drudgery and give more time for leisure study, social, and above all religious life. For what lives man above the brute who holds no social intercourse with his fellow and lifts not mind, heart and soul, in communion with his Creator, Redeemer, Savior, Friend

Why should not the powers that be give a prize to every child of good deportment who would successfully pass an examination on agriculture? Why not give the pupil and mother free passes and entertainment to experimental farms or exhibitions or other educative institutes. If we would eliminate the useless and establish the useful, the money that is now spent on leeches would more than cover expenses. There is another evil of which I will speak, not so much in the interest of the fairly well to do farmers; and the fairly well paid laborer but there is a class in our midst we do well to stop and ask "how do our acts affect them?" I refer to the orphan, the widow, the invalid, the aged and infirm, for as we treat them so a righteous God will treat us. Do not forget the man who makes long prayers, and devours widows' houses will get the hottest hole in hell. Men who cry 'equal rights to all' and have raised the price of labor and produce, lowered the worth of the dollar until these, many of them God's poor, can scarcely provide for home. Look at some of the things that are injuring them that we tolerate. We do not raise enough meat, beef, mutton, etc., in this province for our own use. Yet the Dominion Government paid a man to go around and buy carloads of sheep and lambs and ship them to Montreal vet we import more from Ontario than we export to Montreal. Who pays for that useless truckage? The poor have to pay their share, why have we not a stock yard and abattoirs with their affiliations here and eliminate the useless wages and freight that is a burden to many. Again there are those sent out and paid by us to investigate the high cost of living who say there is no

(Continued on page 686)

BIG COUNTRY CHURCHES

Priest, Farmer, Banker, Community Builder

(By A. Macdonald in Country Gentleman)

All through that part of Missouri they call the big stone church on the hill Father Moenig's Church. Then there are Father Maenig's schools, and Father Moenig's bank, and Father Moenig's pure-bred Guernsey milk cows, and Father Moenig's orthere are Father Moenig's schools, ment farm.

The man who drove me into the settlement said they might as well call the village clustered round the big church, Moenig, if it had not been for Father Moenig there would be no village there to give a name to.

"Why," said the driver, "this road we are going over is Father Moenig's road."

"How is that?" I asked him.

"They call it that because he laid it out, and cut down the hills for it, and graded up the hollows; and now he has a contract to hard-surface the road. He says he is going to make it the best rock road in Missouri."

"I never heard of a priest building roads before," I suggested.

"No, I guess not; but you never heard of a priest like Father Moenig before, either. I'll bet you never did" the driver said.

The road we were on wound up and down, in and out, among the low hills that form the last eastern outposts of the Ozark Mountains in Missouri. The western beginnings of that range of hill country are in Oklahoma. They cdoss the northwestern corner of Arkansas into Missouri, and extend clear across the southern part of that state until they 'peter out,' as the driver said, in a series of humps and bumps and wrinkles, and sink nito the broad, level swamp lands that border the Mississippi River.

Eastward from that last cape of the Ozarks that juts out into swamp country, the range comes to the surface again, forming an island of small hills, seven miles across in either direction, with level country all round it. This tall end of the Ozark hills is known all through that country as Father Moenig's parish.

On the hilltops and hillsides of that island and in its valleys live 130 families of farmers, and every one of them is a member of Father Moenig's Catholic Church; they look to him not only for spiritual guidance but for worldly guidance too.

The driver, who said he was born and raised in that country and knew it like a book, made this remark as we drove along: "I don't believe a woman would put a settin' of eggs under a hen without asking Father Moenig's advice about it first. He tells them what to plant, and when to plant, and when to harvest, he goes to Wisconsin and buys cattle for them; he tells them what kind of chickens to keep; he markets their products for them; he teaches their children; marries 'em, baptizes 'em, and, by gorry"—the driver turned and looked into my face, and gave me a poke with his elbow, the better to emphasize what he was going to say —"he brings a lot of 'em into the world!" He paused there to let that statement sink in.

Doctors and Nurses Them

"He isn't a doctor, too, is he?" I quired.

"Yes, sir, he's a doctor as well as a banker and expert farmer. Lots of 'em won't have anyone else when they're sick. And they say he's a good doctor too. When the smallpox come through all this country a few years age he preached a sermon about it, and told them they all must be vaccinated, and he gathered them all together and vaccinated them, and the consequence was they didn't have the smallpox in these hills, but they had it all round here. Yes, sir, he doctors 'em, nurses 'em, takes care of 'em in health and sicknkess, and when they are going to die he gets them ready for that, and buries their bodies in the ancient graveyard back of the church, and sees to it that their souls get safe off to heaven."

The driver fished up a plug of tobacco, bit off a big chew, gave it a few munches, stowed it into his cheek, and went on: "Whether you're a Catholic or not, you've got to hand it to Father Moenig. He has made these hill farmers prosperous."

Father Moenig's church is on top of a hill, with the two schoolhouses across the road, and the few houses of the village clustered round it. A church was there before the Civil War, and in that struggle guerillas burned it. It was rebuilt, in a way, soon after the war, but it was small and in bad shape. Father Moenig said that when he went there as its pastor, twenty years ago, "It ooked like a colt that had been ridden too hard." He tore most of it down and rebuilt ti, making it larger. He put up the tall spire. He spent $28,000 on the church in six years. The pews are made of yellow poplar, cut in the hills round. There is a big organ in the loft in the rear of the auditorium. An old German wood carver was brought down from St. Louis, and the life-sized figures of saints that are on the altar were carved by him from solid blocks of yellow poplar. Artists have come all the way from the East to see those statutes and the paintings, and have said they are works of real art.

When we entered the church that Sunday morning in February the place was vibrant with the music of the Mass from the great organ and orchestra of eighteen pieces and a choir of twenty-eight voices. There were 585 persons in church that morning and each of them was from a farm.

The Gospel, read that morning from the lectern of Father Moenig, was the Parable of the Sower:

"A sower went out to sow his seed and as he sowed, some fell by the wayside; and it was trodden down and the fowls of the air devoured it.

"And some fell upon a rock; and as soon as it was sprung up, it withered away, because it lacked moisture.

"And some fell among thorns; and the thorns sprang up with it, and choked it.

"And other fell on good ground, and sprang up, and bare fruit an hundredfold."

As Father Moenig finished reading the parable, he closed the book, stepped forward and said:

"How simply our Lord tells that story of the sower and the good seed and the good soil, and the poor soil and the weeds, and of how some of the seed was wasted, and other grew and yielded an hundredfold."

And then he preached a sermon; first, about the spiritual lesson in the parable; then, the application of it to their everyday work upon the farm. He told them of the importance of selecting good seed, and that they must test the corn and wheat to be sure it was good, and, if they had not already done it, that was the time, that very week, to get out the corn tester and put it to work. He talked about the spring rains that were coming, and how they would wash the soil on the hillsides; and he told of a meeting soon to be held, at which A. I. Foard, the county farm agent, would be out to talk to them about terracing to prevent soil erosion, and he urged them to attend. He spoke of the many times the agent had already been with them, and that he was a man of fine knowledge aiming only to help them be better farmers.

"Your farm is a sacred thing," he told them. "Our Lord gave us the land to hold in trust for those who will come after we are dead and gone We must not let the good soil from the hillsides wash away. We must not let our farms run down, we must not waste the alnd, but we must hand it down to posterity better and more fertile than when we received it."

The Gospel of Good Farming

Father Moenig said afterward, when I spoke to him about this sermon: "Well, I want to give them a good lift, if I can. I am here every Sunday morning, passing out the gospel of good living and good farming."

I spoke of the great number at church, and he said: "We seldom have fewer than that; we often have a great many more. Everybody in this parish comes to church. They just leave the house vacant and all come, hired men and all."

He stopped under a great cedar tree in the front yard of his home to tell me that years ago that church parish stretched out twenty miles in all directions. Since then, as the swamps were cleared and settled, the original parish was carved at different times into six parishes, each with its own church.

"Now," he said, "I have only these hills, seven miles across, with 130 families."

"Is everyone a Catholic?" I asked.

"All but one man, a bachelor," he answered.

The ancestors of the people of New Hamburg nearly all came from one village in Alsace. Father Moenig was in the German Army when a young man, and he ran away to America after slapping the face of an insolent officer. He was born in a city and he knew nothing of agriculture until he came to New Hamburg; then he was forced into a study of farming to save his parish among the hills from becoming depopulated.

Eighteen years ago the swamp lands round his hilly island began to be drained and settled. The land there was much better than that of the hill farms, and Father Moenig's parishioners began to move out. He saw that the only way to hold them was to teach them to build up their worn-out and washed-out farms. A field of forty acres was producing only seven bushels of wheat to the acre, and Father Moenig brought an agricultural expert from the state college in Columbia to look at it and see what was wrong. The expert found that for eighteen years that field had been planted to wheat. It was cropped out and worn out. Father Moenig called a meeting of the farmers and the expert gave them their first lesson in crop rotation, and the need of giving th land a rest once in a while, and of plowing under a clover crop to put humus in the soil and of getting nitrogen into it.

"That was an eye opener," Father Monig said to me. "I began to see that we were not producing a fourth of what we ought to for the hard work we were doing. I began the study of agriculture."

He soon saw that the hills of his parish were good for dairying, but his parishioners knew nothing of that, and there was not in all the parish a pure-bred animal. Father Moenig preached a sermon about dairying and how it might make their farms far more productive than they were. In that sermon he told them he was going to Wisconsin to study the dairy business, and invited all who would go with him. He took twelve of his best farmers to Fort Atkinson, Wisconsin, and they visited different dairy farms. He bought seven pure-bred Guernsey cows and a pure-bred bull and shipped them to New Hamburg, and gave them out among the farmers.

Father Moenig went to Louisville, Kentucky, and with his own money bought for $19,000 the entire herd of eighty-five pure-bred Guernseys of Henry Bell & Son, and brought the cattle to New Hamburg and parceled them out among hs parishioners, taking their notes for the cows. He paid $1500 for the herd bull, King Lewis, which has since taken ribbons at state fairs in Kentucky, Ohio and Tennessee. More than one hundred of his pure-bred progeny are owned by farmers in New Hamburg; there are hundreds more of grade cows in the parish.

Pulling Together for One Breed

I was told by a man who had heard Father Moenig lecture on bees that it was one of the most interesting things he ever heard, and that the audience sat, seemingly fascinated as the good priest talked.

In the priest's house, behind the stove, was a big tin sign with this inscription: Pure-Bred Guernseys and Big-Type Poland-China Hogs.

"That is a sign I have just had made," said he. "Each member of our Guernsey and Poland-China association gets one to put up on his fence so that all passers-by may see. It is designed to give them more pride in the pure-bred business. I urge every farmer to give a name to his farm too; most of them have. The Guernsey association meets every Monday night in winter in the big hall over the schoolhouse. It is a community affair and by means of it we all pull together for one breed; not this way and that, for different breeds; but all for Guernseys and Poland-Chinas. We have the county farm agent out from Benton and he helps us. Next August we are going to have a big Guernsey show here."

Through the influence of Father Moenig a cream station was established in New Hamburg, and the New Hamburg cream is of such excellence it brings six cents more than the market price. Last year $14,000 worth of cream was sold through the receiving station.

Father Moenig's annual picnic is known throughout southeast Missouri In a grove close to the church he has a circular band stand, and a dinner hall where 300 persons may eat at once. The picnic is in August. The meats are barbecued on the grounds. The fires in the pits are lighted eight days before picnic day, and they burn constantly, while men keep turning the carcasses on the spits. Last year they cooked four steers, twenty hogs twenty sheep and 300 chickens. The bread was baked in the farm homes and everything was contributed by the farmers.

Three thousand persons were fed there that day, and the village made a clear profit of $3500 from it. The money is used to fix the streets and repair sidewalks and for the benefit of the village in other ways. This picnic has been held annually for 20 years.

Each week-day night, except Saturday something is going on in the school hall. Monday night the Guernsey association meets, and Mr. Foard the farm agent or some other expert is generally there to talk about problems of cattle and hogs. Tuesday

JUNE 8, 1920

BOLSHEVISM AND ITS AIMS

The Maritime Farmer was recently accused of being an opponent of Bolshevism, and cheerfully acknowledged the offence. At the same time the intelligence of the person who directed the accusation was commended editorially by the United Farmer's Guide, the Maritime Province edition of the Grain Grower's Guide, of Winnipeg. In that city they had a pretty thorough demonstration of Bolshevism, just about a year ago, and the ringleaders are now serving prison terms. These gentry, who were convicted by juries composed of farmers, declared against all recognized government, the rights of citizens, and went so far as to refuse supplies and medical treatment, except to those who happened to think along the same lines as the criminals. So the editor of the Grain Grower's Guide, who is also the managing editor of the Moncton paper, has an opportunity of seeing at first hand, the merits of Bolshevistic domination. And so in the issue of the United Farmer's Guide, May 12th, all these splendid? features of radicalism were pronounced "intelligent."

May we ask just how far the enthusiasm of this Winnipeg controlled organ goes? Is it in favor of property confiscation? Does it believe that farmers occupy their properties illegally, that they make use of their farm implements in defiance of the rightful claims of the radicals of this country and that they are making use of their live stocks in opposition to Radical principles, which recognize no property qualifications and declare that all real and personal estate should be for the common good?

And where does the United Farmer's Guide and its highly commended "intelligent" correspondent stand in the matter of religion? The Bolshevists would have none of it. The churches of Russia were defiled, the clergy were foully murdered and every virtue was cast asie. Are these the things which the United Farmer's Guide professes to think so highly of? The managers of that paper can hardly plead ignorance of the cause which they espouse so eagerly and whole-heartedly. We conclude, then, that for political advantage, they are inclined to support general confiscation of farmers' lands, their goods and their herds. It is a policy which the Guide pronounces to be "Intelligent". We leave it to the readers of the Maritime Farmer to say just how "intelligent" they think it. We are opposed to every suggestion of the kind. The length to which the paper and its correspondent have gone makes it more clear, that the Maritime Province farmer would do well to look to his own interests. He can manage his affairs without Bolshevism, Radicalism or Non-Partisan Leagueism. We want none, despite the endorsation of all three by the Winnipeg controlled paper. Elsewhere we publish a sermon delivered by Rev. Mr. Bynon, to farmers, and his opinion of Bolshevism may be read with profit.

SPIRITUAL ADVISER, FARMER AND COMMUNITY BUILDER

In this issue of the Maritime Farmer, the reader will find two articles of special interest to the clergy of the Maritime Provinces.

One of the articles in question is an agricultural sermon adressed, on a recent Sunday, to a large audience composed of members of several Agricultural Societies, in the County of Westmorland, N. B., by Rev. R. M. Bynan, of Lewisville, a Protestant clergyman.

The other article, entitled "Big Country Churches", is from the pen of A. B. McDonald, writing in a recent number of the Country Gentleman, in which Rev. Father Moening, a Roman Catholic clergyman, of Missouri, is depicted as Priest, Banker, Farmer and Community-Builder.

We have, in the Maritime Provinces, a number of clergymen who do not think it beneath their dignity, nor detrimental to their social or spiritual standing to take an active interest in matters agricultural. So those who may be somewhat indifferent to matters of this kind, a careful perusal of these articles is especially commended.

Clergymen who take an active interest in the avocation of their parishioners, find that by working in sympathy with their temporal affairs, it is much easier to enlist their interests in spiritual matters. The influence that such noble workers as Rev. Mr. Bynon, Rev. Dr. P. C. Gauthier of Prince Edward Island, Rev. Fr. Legace of Kent Co., N. B., and many others whom we might mention, has been a tower of strength in setting the example of agricultural progressiveness in their respective communities.

There are practical lessons for the layman in the example of these men. May some of the principles set forth in the articles herewith reproduced, be seed sown on good ground, and bear fruit many thousand fold.

CANADIAN TRADE RULES

The following article concerning Canadian Trade Rules, from the columns of The Daily Telegraph, St. John, is heartily concurred in by The Maritime Farmer.

The work of the Reconstruction Association of Canada is attracting wide-spread attention in the United States. The association which is paying special attention to the development of Canadian trade has recently adopted "Ten Rules for Canadian Trade" which should greatly stimulate activity in promoting the nation's material progress. **The rules are as follows:**

1. Buy Canadian products. It means busine expansion, more work, more workers, more goo and more wealth for everybody.

2. Import only necessities, and then only similar Canadian articles are not available.

3. Produce to the limit in field and facto Increased production means new wealth.

4. Co-operate, conserve, specialize, standa ize. This is the way to increase production, prove quality and lower prices.

5. Develop export markets. Foreign b ness gives stability to domestic industry a trade.

6. Utilize Canadian services, transportati expert assistance in any line, etc., and spend va tions in Canada.

7. Manufacture raw materials to final sta in Canadian factories. It is money lost to other nations do it.

8. Use science for the determination and d velopment of natural resources.

9. Make quality the hallmark of Canad products.

10. Be fair to Canadian capital.

Government officials in Washington have b so impressed by these rules that they are send them in printed form broadcast in the Unit States, and pointing out that they are as appl ble to the American people as to the citizens the Dominion. The Bangor News, commenting the wisdom of applying such rules to busine says that "if they were widely studied and heed they would be worth millions a year."

RULES FOR SUCCESS

Marshall Field & Co's rules for success: To the right thing, at the right time, in the rig way; to do some things better than they we ever done before; to eliminate errors; to kno both sides of the question; to be courteous; to an example; to work for the love of the work; anticipate requirements; to develop resources; recognize no impediments; to master circ stances; to act from reason rather than rule; to be satisfied with nothing short of perfection.

The rules of various individuals for success:

Give your body and soul plenty of sunlight.—Thayer.

Deny self for self's sake.—Franklin.

Put all of your eggs in one basket and wat that basket.—Carnegie.

Employ an hour and a half every other eve ing in some important and constructive culti tion of the mind.—Arnold Bennett.

Control yourself. Anger is too valuable use except on special occasions.—Joseph H. App

Be of good courage; that is the main thing— Thoreau.

Never tell business lies.—Baron Rothschild

Now's the only bird lays egg o' gold.—Low

"It cannot be done," cries the man witho imagination. "It can be done, it shall be done cries the dreamer.—Marden.

* * *

If part of the world is always on strike, ho can the rest of us work to advantage? And, if takes all that we can do, even in peace times, t maintain the "scale of living" which we have d veloped, how can we produce enough food, clot ing and shelter to catch up with ourselves overtake the losses from war, should part of lay off all the time? If we look only to the stri and other hold up methods to even up—or down— how and when shall we begin to gather up and to overtake our shrinking supplies?

* * *

Farming is no get-rich-quick scheme, but it is the path to a rich, full life, and well will it be when the flocks and herds multiply on all our farms and we learn to live within our own resources. Nineteen hundred and twenty is full of big lessons for the farmer, but not one hints at increase of flocks, herds, or acreage in cultivation upon the basis of hours and wages controlling mill and factory.

TRYING TO EXPLAIN THAT PROFITEERING

United Farmers of Ontario Vainly Try to Explain Why They Soaked The Farmers of Ontario. New Brunswick Farmers Better Buyers and Wiser

Although the Maritime Farmer has not been asked to publish the following reply from the United Farmers of Ontario, in regard to the charging by them of $4,450 per car more for No. 1 Red Clover seed, than was paid by New Brunswick farmers, after paying freight and expenses from Toronto, we are publishing it in full for the benefit of our readers.

THE U. F. O. REPLY

The "Maritime Farmer" of April 13th markes some very ugly statements against The United Farmers Co-Operative Co., Limited, with regard to the prices which they charged the farmers for their grass seeds. The writer claims that his paper sold red clover seed at the rate of $4,400 per car less than our company here and other grass seeds at very much lower prices, and infers from this that "if there ever was a concern caught red-handed in profiteering it is The United Farmers' Co-operative Company of Toronto." We think he should investigate the circumstances and try to find out some of the facts before he starts any such mud-slinging.

We are making no secret of the prices we charged for these seeds. In deed, we are proud of them. We claim that we have saved for the farmers of Ontario many thousands of dollars because we sold at much lower prices than those set by the retailers.

If the "Maritime Farmer" sold its seeds at the prices stated it must have purchased them away back in 1919. This was good business, but we are not in the fortunate position of having oodles of money in our reserve fund to always purchase every thing just when it is most advantageous. Last fall The U.F.O. Company had a paid-up capital of some $90,000 and was carrying a stock in trade of nearly $100,000. Under these circum stances it could not very well finance the purchase of $80,000 of clover seeds to carry them in stock during the winter.

In January of this year we bought seeds right up to the limit of our credit The comparative cost and selling prices were as follows:

	Cost	Sold
No. 1 Red Clover	$45.00	$47.00
No. 1 Timothy	8.64	9.50
No. 1 Alsike	38.40	41.00

I think that even the "Maritime Farmer" will admit that after deducting the overhead expenses there was not much "akin to highway robbery" in the transaction. Evidently the farmers of Ontario dd not thing so either, for in less than three weeks we were away oversold. On February 27th we bought 100 bags more of red clover and 20,000 pounds of timothy. The prices had advanced materially since the former transaction, and were:

	Cost	Sold
No. 1 Red Clover	$45.00	$43.00
No. 1 Timothy	9.36	10.00
No. 2 Timothy	8.64	9.50

If the writer had taken a little bit of trouble to find out our methods of business he would have learned that by the terms of our charter the maximum dividend on capital stock that may be paid is seven per cent. After the books are closed at the end of the year the first charge against the gross profits is the ordinary operating expenses of the company, next comes the dividends to the shareholders. What profits still remain after these charges are paid go back to the customers in proportion to the amount of goods they have purchased during the year. We leave it to the readers to say whether these profiteers which the "Maritime Farmer" has caught red-handed are going to become bloated with wealth from the huge profits shown in our figures above.

Our most estimable friend would "allow a jury of good clean Kings County farmers to say whether a profit of four thousand, four hundred and fifty dollars, plus freight from Toronto to Sussex, N. B., on one car of clover seed does not constitute something akin to highway robbery." I think we can come to an agreement on this point without going to all that trouble. We will call it "carried unanimously" and will even go one further and suggest that anyone getting it should be hanged as a profiteer.

"Those who wait until the last minute to order their seeds are going to wish they had followed the example of their more alert neighbors," says the "Maritime Farmer." Very true, but unfortunately in business besides alertness there is always the question of finance, and after all, 'it's money makes the mare go."

We want every farmer to read this reply to the United Farmers of Ontario, very sarefully. Particularly are we anxious that the hundreds of farmers in New Brunswick and Nova Scotia, who bought their seed co-operatively this year, should read and digest it.

In the first place, the farmers of New Brunswick did not buy seeds until January fifteenth, 1920. The seeds were not paid for until March twenty second, 1920. When they were paid for it was by the Farmers of New Brunswick and Nova Scotia, themselves, and not by any wealthy persons or by any wealthy corporation. The Maritime Farmer has repeatedly said that the farmers of these provinces do not have to take lessons from anybody in running their own affairs and this exploitation of the farmers of Ontario proves that. We saved the farmers thousands of dollars as compared with their fellows in Ontario, and we did it on the open market.

Why, as late as April seventh last New Brunswick farmers bought No. 1 Clover Seed in Toronto, on the open market, in small lots for $43.00 per bushel. And they bought No. 1 Timothey for $8.88 per bushel. That is they were able to buy in small quantities and pay all expenses to the Maritime Provinces, and still undersell the United Farmers of Ontario by about two thousand dollars per car.

We are glad to note that profiteering is admitted. The Maritime Farmer repeats that the whole transaction borders on highway robbery. The explanation doesn't explain. It doesn't convince the hundreds of farmers who saved the thousands of dollars. They know because they acted for themselves and did not stand for being exploited. No more ridiculous defence was ever made of a transaction than the one we cheerfully publish. May we again ask for a more satisfacto y explanation of the steal?

TENT CATERPILLARS PLENTIFUL

The apple tree tent caterpillars and the forest tree tent caterpillars, particularly the former, are observed in greater abundance than usual and promise to cause considerable defoliation and damage to orchards unless controlled as outlined below.

On small trees the young caterpillars may be best destroyed in their tents by crushing with a piece of sod or old sack. This is best done in the evening or on a dull day when the young caterpillars are all in the tents; this cannot be done in bright sunshine as the caterpillars will be spread all over the trees feeding on the young leaves.

On trees that are too large for the nests to be reached handily the simplest and best way to control these caterpillars is to spray the trees with some form of stomach poison early in the season before the caterpillars are more than half grown. The sooner this is done after the elaves unfold, the better. This insect is effectively controlled by the poison in the first regular apple tree spray, which is applied just before the blossoms open, and consists of Bordeaux mixture made of 3 pounds of Bluestone, 10 pounds of hydrated lime or water slaked lime and 1½ pounds of arsenate of lime to 40 gallons of water. Or in place of this spray, a spray of 1½ to 2 pounds of dry powdered arsenate of lead to 40 gallons of water will kill these caterpillars.

The method of killing these caterpillars in their tents by burning them with a swab soaked in kerosene is to be discouraged as quite often part of the branch on which the tent is, is destroyed by the burning.

The Apple Tent Caterpillar spins a true tent or web, and can by this feature be easily distinguished from the more destructive Forest Tent. Within the tent the caterpillads spend the nights and stormy days. With this exception and the fact that the apple tent does not feed on forest trees, the life histories of the two insects are the same.

The caterpillars differ in that the Apple Tent has an unbroken white stripe down the back, while the Forest Tent has a row of white spots.

Our Egg Price Now 48c

The Maritime Farmer has paid out quite a bit of money for eggs in the last fortnight. Never before have the farmers of the Maritime Provinces had such an opportunity to get the top price out of their eggs. We offer for the next two weeks forty-eight cents per dozen for eggs. This price is for choice eggs f.o.b. St. John. The eggs must be strictly fresh and suubject to candle test. Be sure and address all eggs to The Maritime Farmer, St. John, give shipper's name and address. Also notify The Maritime Farmer, Sussex, but be sure and ship eggs to St. John.

Remember only strictly fresh eggs should be shipped.

TIME FOR THE THIRD SPRAY

(By G. Sanders)

After the blossoms have dropped and before the calyx has closed.

On account of russetting the fruit, Bordeaux cannot be used for this spray. The formula that has given good satisfaction in the past is the soluble sulphur 1 lb., hydrated lime 5 lbs., and arsenate of lime ½ lb., to 40 gallons of water.

If Green Apple Bug is present the formula should be 2 lbs. soluble sulphur and 1 pint Black leaf 40 to 100 gallons of water.

If biting insects are bad such as Tussock Moth or Codling Moth, the sulphur spray may be eliminated and 3 lbs. of dry lead arsenate to 40 gallone used. This will not only control the biting insects better than a combination spray, but it will prove a better fungicide than soluble sulphur

The pests controlled by this spray are Apple Scab, Codling Moth, Green Apple Bug, Tussock Moth, Green Fruit Worm and 'Pit Rot.'

Year in and year out this spray will probably average the most important in the producton of apples although in many seasons others are more important. Excepting where Green Apple Bug is present it is advised to apply this spray as a fog mist in Nova Scotia.

THE POTATO CROP

(Experimental Farm Note)

The potato is one of our most important food crops, and yet it is one that very often does not receive the attention it should. It is the practice of many farmers to leave the plantnig of potatoes until practically all other crops are in. With the exception of, perhaps, some parts of the Maritime Provinces this late planting means a much smaller yield than there would be if the planting were done before the middle or by the middle of May. By the end of May or beginning of June the seed potatoes have sprouted so much that when these are broken off at planting time the new shoots will not come on with the same vigour as they did early in the season. Furthermore it is important for the potato to get a good root system before the hot weather sets in.

It is of the greatest importance to use good seed. Two lots of seed of the same variety which look very much alike may give a difference of three hundred or more bushels per acre in the crop, as has been shown in experiments at the Experimental Farm. Ottawa. In 1919, for instance one lot of Irish Cobbler yielded at the rate of 378 bushels per acre and another 37 bushels per acre. The best Green Mountain stcok yielded 330 bushels per acre and one of the poorest 46 bushels per acre.

If possible, one should know where the seed was grown the previous year that he is about to use. If it came from a crop, the plants of which grew vigorously until cut down by frost, then, if free from disease, it will, as a rule, yield a much better crop than if it is from a crop, the plants of which withered in the middle of summer and the tubers lay in hot soil the rest of the season. This year when the price of potatoes is so high there will be a temptaiton to use small potatoes for seed. If these small potatoes come from a good crop the previous year the results are likely to be satisfactory if the season is favorable, but if they are from a small crop the previous yar when the plants dried up early the plants this year are likely to be weak and the yield not very good. Good sized sets of from one and a half to two ounces have been found the most satisfactory taking one year with another, although if the season is particularly favourable smaller sets will produce a good crop, but one cannot tell what the season will be, hence it is better to be on the safe side.

The distance of planting which has been found most economical in most places in Canada is, rows two and a half to three feet apart and sets twelve to fouurteen inches apart in the rows. While quite shallow planting has given the highest average yields at Ottawa, it is necessary to plant about four inches deep for field culture to enable one to harrow before the potatoes are up without pulling up the sets.

The varieties which have been most generally satisfactory in Canada are Irish Cobbler as an early potato and Green Mountain as a main crop or later variety. Other varieties which cannot be distinguished from Green Mountain and are included in the Green Mountain group are Gold Coin, Uncle Sam, Wee MacGregor, and Delaware. The Dooley of the rural group has done well in the warmer parts of Ontario, and in coast climates Burbank is also popular.—W T. Maccun. Dominion Horticulturist.

Work is well known on the dairy farm, but worry is not a frequent visitor. Few business have a surer foundation.

'Xact book accounts and complete records are absolute essentials in successful dairying.

HORTICULTURE.

METHODS OF GROWING TOMATOES

Tomatoes should be kept growing from the time the seed germinates until the fruit is ripe. If sown in the hot bed very early they are likely to receive an injurious check when held back until it is safe to plant them out When the seed is sown about the middle of April the seedlings are ready to prick out into flats about the 10th of May and should be ready to set out immediately after the early June frost, which usually occurs in Pince Edward Island the first week in June.

They are ready to prick out into the flats when they have the third leaf. In setting them out they should be planted so that the first leaves are about level with the ground. A little clay may be mounded around them to protect them from the wind.

Any good garden soil is suitable for tomatoes. It is usually best to delay manuring the plants until after the first fruit has set. Most amateurs make the mistake of planting in soil too rich in nitrogenous manures, which produces great vines with late fruit or a very large percentage of green fruit. Once the fruit has set, then liquid or other forms of manure may be applied generously.

A series of experiments were conducted with two varieties, "Bonny Best" and "Cparks Earliana," for several years at the Charlottetown Experimental Station, to determine the best method of growing tomatoes. Five methods were used with each variety as follows: No. 1. The plants were set four feet apart each way and the plants allowed to spread over the rground. They were unprun ed and left lying on the ground.

No. 2 Planted two feet by four feet apart. The tomatoes were prun ed to two stems and tied to wires.

No. 3. Planted two feet by four feet apart. The tomatoes were pruned to one stem and tied to stakes.

No. 4. Planted two feet by four feet apart, pruned to one stem, and tied to wires.

No. 5. Planted two feet by four feet, pruned to one stem, tied to stakes and one half of the foliage removed during the ripening period.

The first method produced the greatest quantity of fruit each year with both varieties. The tomatoes were later ripening than with the other methods and the total quantity of ripe fruit from the plot was less than on the plots grown by the second method, where the plants were pruned to two stems and fastened with wires. The second method gave the largest returns of ripe fruits. This was closely followed by methods No. 3, which produced the most early ripe fruit, though not the greatest total quantity. The removal of the foliage in method No. 5, decreased the quantity of both ripe and green fruit, but greatly increased the percentage of ripe fruit on the plants.

Large quantities of tomatoes can be produced by planting four feet apart each way with the least amount of labor. A good percentage of ripe fruit can be obtained if the plants are not supplied with nitrogenous manures until after the tomatoes have set. The method that was most successful in producing ripe fruit early in the season was that of tying the plants to stakes placed two feet apart in the rows. J. A. Clark, Superintendent, Dominion Experimental Farm, Charlottetown.

SOWING GARDEN BEANS

(Experimental Farm Note

Beans are an important truck crop—Garden beans are one of the most important truck crops and practically every farmer should grow a patch for sale or for home consumption, ac cording to his location. Being a leguminous plant, this vegetable stores in the soil nitrogen gathered from the air, and the cultural metho ds generally given to it leave the ground in splendid shape for the following crop. The consumer also has great advantages in buying them as they are a delicacy, they may easily be canned and are considered a very healthful food indeed.

One or more varieties.—To be profitable and palatable, garden beans should be eaten when the pods are well grown but still green, and this period only lasts during about a week of the plant's life. This in why a succession of sowings is generally made by persons who desire to have this fine vegetable on their table for any length of time. It was suggested that a numbr of varieties of different seasons, put in the same day, might do as well, and this prompted an experiment at Cap Rouge.

The Cap Rouge Experiment—The object was to compare the yield of green pods from one variety, sown at four different intervals of about a week, with that of four varieties of dieffrent seasons the same day. The results of five years showed that Round Pod Kidney Wax, sown at four different intervals, yielded at the rate of 3138 quarts of green pods per acre, whilst Round Kidney Wax, Stringless Green Pod, Early Red Valentine, Refugee, sown the same day yielded at the rate of 3298 quarts per acre.

One Variety Generally Enough—The difference between the two methods was only around five per cent which is practically negligible, and it seems that either will about give the same results. Persons who would rather make only one sowing, and be done with it, will have, of course, to choose varieties of different seasons, whilst others who prefer to sow at intervals of a week or ten days, should take an early variety, such as Round Pod Kidney or Pencil Pod Wax, so as to get the first edible pods as soon as possible.

Save your own seed—Probably the latter way is preferable as ripe beans can be gathered from strong healthy plants each year, for the next, which not only means a saving of money, but, which is quite important, one is thus sure of getting seed of good vitality and of the right strain. G. A. Langelier, Superintendent Experimental Station, Cap Rouge, Que.

TIME FOR SECOND SPRAY

By G. E. Sanders

When the blossoms show pink but not open. This spray may be 2—10—40 or 3—10—40 Bordeaux and I pound of arsenate of lime to 40 gallons of solution. On susceptible varieties or in orchards liable to serious outbreaks of Apple Scab, 3—10—40 Bordeaux is advised. The 3 pounds of copper sulphate to 40 gallons will make a much better fungicide than 2 pounds to 40 gallons and only cause a slight increase in the russetting of the fruit.

The second spray controls Apple Scab, Budmouth, Green Fruit worm, Canker worm, Browntail Moth, Tent caterpiller and Green Apple Bug.

If insects are bad, this spray should be applied with considerable force, but if no special outbreaks of insects are present, applying the spray as fog will give the best results.

If Green Apple bug is present do not use the Bordeaux formula. Use 2 pounds of soluble sulphur and 1 pint of Black Leaf 40 to 100 gallons of water and apply as a very thorough drench at high pressure.

It will be remembered that last year those who applied the second spray very thoroughly got the best results.

It sometimes happens that the first spray is of no great consequence in the control of Apple Scab but it is very seldom that a man can neglect his second spray without serious reduction in the quality of his fruit.

THE DISEASES OF PLANTS

We know that plants are attacked by numerous diseases. Who among us is not acquainted with rotten potatoes, smutted grains, and scabby apples? Who among us, farmers, ever and anon does not suffer some kind of losses due to them? But if we know very well the effects of the diseases, we do not always understand the causes of them. It is not surprising. Agriculture is too complex a science to be throughout known by any one man. We have to divide it into several branches or specialties and assign to each of them professional men, the experts, who devote all their time for the -advancement, the improvement and application of those particular lines.

Massey-Harris

Harvest Your Hay Crop with Ease

THE farmer equipped with Massey-Harris Haying Tools harvests his hay crop without rush or worry. He gets all of the hay in its best condition, for with such modern machinery it is handled right and handled quickly, and it is handled with the minimum of help, a point of special importance in these days.

There's a machine for each operation in the Massey-Harris line—a mower that handles tame and wild grasses alike, and goes through an entire crop without a hitch—a Rake and Tedder, or the modern Combined Side Rake and Tedder facilitate the handling of the crop—and the Hayloader and the Bain Wagon with Rack get it to the barn in the most efficient manner.

We have to have our chemists, microbiologists, zootechnists, etc., and our plant pathologists. We have to follow their advice. It is the sine qua non condition of a progressive agriculture.

Plant pathology is one of those sciences. It studies the diseases of plants. The professionals who give attention to it are called Plant Pathologists. They are the Doctors of the plants. Let us learn from them the causes of the diseases in plants and how to fight against those intruders of our fields. But, before we discuss these plants, let us speak a little of the

Economic Importance of Diseases in Plants

The diseases of plants reduce the world's food supply; they interfere with our necessities, decrease the materials from which we derive our clothing, shlter, etc. It is on that account that they are of economic importance.

The disease looses occur, under modern conditions, in three different phases of the handling of plant products: production, storage and transportation-distribution.

It is with regard to the first of these phases—production—that the losses have been longest appreciated. They have received in the past almost all the attention of those who have concerned themselves with such matters.

Nowadays, in order to have fruits or vegetables in any season, even in the dead of winter, we store them in vast quantities in great coldstorage plants. Here again diseases destroy the products which have already cost heavily for their production.

With the development of modern transportation and distribution, food products have become more and more important items of our daily food supply. The conditions under which they are confined during transportation are, in many cases, very favorable to the development of diseases the germs of which were already on the products when they came from the field.

The losses from plant diseases that we have to support every year is scarcely suspected by the average man. Canada loses 6 per cent. of her grain crop each year, that is, for 1918, the following numbers:

	Yield	Losses by smuts
Wheat,	381,677,700 bu.	22,900,662 bu.
Oats	33,357,400 bu.	18,881,994 bu.
Barley	77,378,670 bu.	4,442,720 bu.

That gives for those three crops only a total of 46,225,376 bushels.

In 1917, the late-blight of potatoes in the Province of Quebec alone, caused $15,000,000 of loss to farmers. The same disease was very prevalent last year also. The crop was a com plete loss in many districts.

Anthracnose of beans, wilt of cucumbers and melons, scab of apples, canker of apple-trees are but a few among the great number of these plagues.

Although United States harvested in 1917 over 3 billion bushels of corn an additional 175 million bushels was destroyed by smut.

It is estimated that the losses in the apple crop of the State of New York through neglect of spraying amount to over 3½ million dollars annually.

When a man buys 6 cotton shirts he pays for a seventh lost to disease in the cotton fields of the south.

We have many records of the calamitous effects of plant disease epidemics. In 1844 and '45, late-blight of potatoes caused serious distress in Europe and resulted in Ireland in a real famine in which thousands of people died.

A pathogene from America—the one which causes the grape mildew—introduced into France about 1878, spread with alarming rapidity and threatened to destroy the vineyards of this Country until the discovery of Bordeaux mixture by Millardt averted the catastrophe. The chestnut blight has nearly wiped out the chest nut forests of America.

The wastage of plant products from disease is a constantly recurring drain upon our most vital resources. The losses are first of importance to the consumer for, in the end, the consumer pays the bill for this wastage. They are of distinct concern to the distributor, and the producers, as individuals, commonly lose heavily. Finally, the State is a heavy loser by reason of plant diseases. It is the reason why Governmnt by means of experts, laboratories and quarantine laws is helping the farmers to fight the diseases and injurious insects. We have to follow their advice and to be a little more interested in bulletins and reports they publish. Let us not forget also that we hav in Quebec the "Society for the Protection of Plants against Diseases and injurious Insects," founded some twelve years ago at Macdonald College. Let us become members of it by sending our names to its Secretary, Dr. J. M. Swaine, Entomologist Ottawa. The annual report of this Socity is filled with valuable information.

It is time now to broach the subject of the causes of the diseases in plants.

Causes of Diseases in Plants

Any factor capable of initiating disease in plants may be said to be a pathogene. What is a pathogene?

The vegetable kingdom, the world of the plants, is divided into four large groups: the Spermatophytes, including the plants which reproduce themselves by means of seed; the Pteridophytes, which include the ferns; the Bryophytes, which comprise the moss, and at the bottom of the world of the plants: the Thallophytes, including the low plants: Myxomycetes (the lowest of them); Bacteria; Algae; Fungi and Lichens. Among these five classes, the Myomycetes, Bacteria and Fungi are known to be the pathogenes, the organisms capable of initiating disease in the plants. They are parasites, that is, incapable of living an independent life. They have to rely for their nourishment on the food already prepared by the higher plants. In other words, they live at the expense of

DAIRYING.

MILK AS A CURATIVE AGENT

Dr. F. E. Moore, of the Moore Sanitarium, the leading institution on the Pacific coast devoted to the use of milk as a curative agent, says:—

"We believe the raw Holstein product to be ideal for the milk diet treatment and use it exclusively in our sanitarium.

Our Holstein milk runs from 3 to 3.5 per cent fat, 9 per cent solids not fats, and the bacterial count remains under the certified standard of 10,000 per C. C. This proves to be an ideal milk for the milk diet treatment. The small Holstein fat globules and the lesser amount of cream make it possible for the patient who is taking the whole milk to do so without embarrassment. I do not beieve the milk cure can be given successfully with the Jersey and Guernsey products. They might be tolerated by some stomachs, but taken in the generous quantities necessary many patients would not tolerate milk so rich in butter fat and the larger fat globules. Likewise, pasteurized milk cannot be given successfully.

The general public has the wrong idea in demanding milk carrying a high percent of cream. The Holstein milk digests easier, the fat globules being smaller, but very important is the fact that outside of flesh-producing qualities and some heat value, the cream is not of the importance credited to it. The public mind has been permitted to dwell too much on so called rich milk, while in truth its richness does not depend upon the amount of cream the eye can see on the milk surface. They do not know that casein and milk sugar are invisible, and are just as important as the fat. It is a fact that skimmed milk containing practically no fat is a very valuable food. The nitrogenouus sub stances, carbohydrates and inorganic salts are the constructive constituents, which the body requires of food. These constituents are perfectly balanced in milk, and serve to make blood, bone and muscle, while they also supply energy."

Real Cows or Scrubs

Commissioner of Public Institution G. F. Stradley, Asheville, North Carolina, recently solved the question: "Does it pay to own real cows?" Mr. Stradley sold seven of the scrub cows kept at the County Home Farm and purchased three high-grade Holsteins to replace them. He estimated that the scrubs cost around $15 per cow, per month, for feed, a total sum of $105 for the seven. He has now discovered that the high-grade Holsteins do not eat any more than the scrubs, which brings the feed bill down to $45, a saving of about $60 per month on feed alone. And—here's where the rub comes in—these three Holsteins produce as much milk as the seven scrubs did! The three Holsteins cost around $700 and the seven scrubs were sold for $350. Two heifer calves and a bull calf have been dropped by the newcomers to the farm, and the value of these, together with the saving on the feed bill, is not the least encouraging feature of this changing over from scrubs to real milk cows. Commissioner Stradley's happy experience should open the eyes of many farmers in those sections of North Carolina where the scrub cow still exists and continues to prevent its owner from becoming a real dairy farmer.

More Profit from Fewer Cows

An interesting and significant story is told of a Saskatchewan farmer who owned a milking herd of 14 cows. He decided to test them and the result of his careful investigations in this line was absolute proof that 10 of the cows were not paying for their feed bill. Of course he disposed of these expensive animals at once and secured some real milk producers to take their places; but—here is the most interesting part of the whole story—only five good cows were required to replace the 10 poor ones, for they gave more milk than the 10. We may well credit this farmer with amazement, chagrin and thankfulness —as the truth dawned upon him concerning his past opertions with cows and what the furture might now hold for him. Yet there are still, doubtless, many farmers uselessly carrying the same burden of unprofitable investment and labor under which the man struggled so long, and like him in ignorance of their mistake. It is for such men that we are repeating this story that has come to us from the northwest. Any man owning cows, the production of each one of which is not known to him in weight and fat percentage, should read it and take its warning to heart. A cow that does not produce milk enough to pay for her feed should be fitted for the butcher at once.

How the Cow Testing Association Helps

Another unprofitable cow comes to hand—this time from the Missouri college of agriculture. It is a surprising one: A man in Webster Co. was milking 50 cows when he joined the cow-testing association in June. The test eliminated 26 and he is now making more profit from the remaining 24 than he made on the whole 50 besides reducing his labor by one-half. His neighbor, who started in a year ago with 37 cows, has reduced that number by 14, with the same result—more prolt from fewer cows. It was found that 36 per cent. of the cows in this county association were losing money for their owners. The cow-testing associations have done much for dairymen. They teach the way to find the profitable cows by the use of milk scales and Babcock test. More power to them.

HEAD YOUR HERD WITH PURE-BRED SIRE

Why should anyone be satisfied with scrub cattle? It is true there are not enough purebreds for all, but the heifers from a scrub herd will be wonderfully improved over their dams if they are sired by a good pure-bred bull from a productive dam A registered bull calf can be had at a reasonable price from a dam which has made a creditable record, and the offspring of such a bull proves the wisdom of the investment. It is a known fact that in many cases the milk production by the heifer of such a bull is more than double that of the dam. Neither these animals nor their ocspring will ever be purebred but the continued use of a first-class registered dairy bull of the same breed will in a few years result in a herd that may equal in production many purebred herds.—E. O. Hansen, of the Dairy Husbandry Division Minnesota College of Agriculture).

MAKING GOOD DAIRY BUTTER

The old saying: "The world was not made in a minute," also applies to the making of good butter. Under no conditions can butter be properly churned in five or ten minutes. A half hour is about the average time required to get butter to come in a beautiful granular form, with the buttermilk testing 2 per cent. or less One commonly hears the remark: o"My butter came in six minutes to day," and the response comes back from the neighbor, "Why, mine came in four minutes." Butter can only come in this length of time when the temperature is too high. This means a greasy butter churned up into a big lump with a lot of buttermilk mixed up in it, and what buttermilk

Test the soothing action of the Empire teat cups

VISIT some farm or dairy near you where they are using Empires. If you don't happen to know of one, write us and we'll direct you. Ask the man to let you test the action of the teat cup. Put your thumb in it. Then you'll understand why cows like the Empire—why there is no possibility of teat or udder trouble—why they let down easily and give more milk and act so contented when the Empire is at work.

The Empire Teat Cup massages the teat from tip to udder—an exclusive Empire feature—and one absolutely essential if cows are to be kept in perfect condition.

The action of the Empire Teat Cups is only one of the superior features of the Empire, but the more you examine the machine and talk with users the more convinced you'll be that the Empire is the machine for you. If you're milking 10 or more cows you should read our catalog 20 Write for it today.

there is left is as rich as average whole milk. When butter is properly churned it must come in granules ranging from the size of a wheat ker nel to a corn kernel. The factors affecting the length of churning may be placed under three heads:

Factors Pertaining to the Production of Milk and Cream

1. Breed of Cow: The fat globules in the milk of different breeds are not the same size. Those of the Jer sey and Guernsey breeds are larger than those of the Holstein and Ayrshire breeds. Since cream containing large fat globules will churn more readily than cream containing small globules, cream from Jersey and Guernsey milk will churn more easily, other conditions benig the same.

2. Stage of lactation: Toward the latter part of lactation the fat globules become very minute and hence cream from stripper's milk churns with difficulty.

3. Season of the Year: In winter time it is natural for the fat in milk and cream to become chilled and there is usually little or no rise in temperature during the churning pro cess. Hence cream does not churn as easily in the winter time.

4. Feed: A ration without any succulence in it, such as corn silage beets or beet pulp, is conducivve to the production of hard butterfat globules and hence to difficult churning

5.—Size of the Herd: Difficult churning occurs most frequently when the herd is small, one to five cows. In the small herd the factors above mentioned are apt to play an important part. The individuality of the cow is to be reckoned with in the case of the small herd. The cream from certain individuals may always churn with difficulty. When the cream comes from mixed milk of a larger herd, the variations due to individuality are covered up.

6. Thickness of Cream: Cream which tests 20 per cent. or less will churn with greater difficuulty than a 30 to 35 per cent. cream, simply because the butterfat particles are nearer together in the 30 per cent. cream. One should aim to make a 30 per cent. cream for butter-making Without a separator this is, of course impossible, and a man without a separator is more liable to experience difficulty in churning at various times. Too thick cream is not desirable, as it sticks to the churn and churns with difficulty.

Factors Pertaining to the Handling of Cream

1. Bacterial Contamination. It sometimes happens, although cases are rare, that cream becomes contaminated with certain ferments which cause it to froth and foam and makes churning an impossibility.

2. Sourness of Cream. Although sour cream looks thicker than sweet cream, it is less sticky and the fat globules come together into bututer more easily from sour cream than from sweet cream.

3. Churning Temperature. In all probability a large proportion of the cases of difficult churning are due to the fact that the butter maker does not possess and use a good dairy thermometer. No definite churning temperature can be given to apply to all cases. In general, on the farm, the churning temperatures should be 52 degrees to 58 degrees Fahr. in summer and 58 degrees to 65 degrees Fahr. in winter.

Factors Pertaining to the Churning Process

1. Type of Churn. The churn should be of the barrel or combined type and be so built as to give proper concussion. In case of the barrel churn the staves should be nearly straight or else cream will flow around in the churn rather than rise and fall.

2. Fullness of the Churn. To secure best results, the churn should never be filled more than one-half full of cream. To get butter to come there must be concussion. There is no room for it in the churn that is too full. Neither will the butter come easily in the churn that has but ittle cream in it, due to the fact that the cream simply coats and sticks on to the sides of the churn.

3. The Speed of the Churn. The speed should be such that cream can be heard to rise and fall with each revolution of the churn. Too slow speed means that the cream simply flows from one end of the churn to the other, while too fast speed means that the cream is held stationary in one end of the churn.

A Combination of Circumstances

More often a combination of some of the factors above mentioned cause difficult churning. For example, a man with one cow, well advanced in lactation, in the winter time, raising cream by gravity, feeding corn stalks timothy hay, gluten and bran, and churning in a churn that is large enough to accommodate the cream from five cows, certainly is in a bad predicament, and has reasons enough why his cream doesn't 'come.' The remedies can be read in the causes as they have been stated. Some have reported that scalding the milk before separating it overcomes the trouble. Either this or pasteurizing the cream by heating it to 145 degrees Fahr. and holding it for from 20 to 40 minutes is sure to help, particularly if cream is to be churned in a sweet condition

You May Not Wisely Delay Ordering Your 1920

DE LAVAL

CREAM SEPARATOR

There are a dozen reasons why this is so.

For three years it has not been possible to make enough De Laval machines to meet the demand. More than ever are being made this year, but the demand is still greater.

Cream Separators have advanced less in price than anything else used or produced by the farmer during the war years. If labor and material costs continue to advance so must separator prices.

Such an advance must very soon come from increased freight rates, if from no other cause.

Freights are still slow and uncertain. There may be unavoidable delay in getting a machine when you badly need it from this reason.

The flush of milk and hot weather are near at hand, when a De Laval saves most and an inferior or half-worn-out separator wastes most.

There are still other reasons, which a De Laval best demonstrates for itself. You will have no difficulty in observing them. Every local De Laval agent will be glad to afford you the opportunity to do so.

If you don't know the nearest agent simply address the nearest main office as below:

THE DE LAVAL COMPANY, Ltd.

HOW TO IMPROVE THE QUALITY OF LAMBS FOR MARKET

High quality brings the high dollar in the market. Every sheep owner should get his shoulder behind the wheel and lift to establish a standard of high quality for Maine grown lambs and wool.

We are in the midst of the lambing season and quite naturally the minds of those most vitally concerned in the upbuilding of the sheep industry are giving consideration to those things which must be done at this season, and which have much more to do with quality than is known to many growers.

The first to consider is that the young lambs must be well nourished as their growth is much more rapid the first few weeks of their life than at any time after; under-nourished lambs fail to get this rapid growth at the right time and seldom, if ever, are they able to overcome this setback. With lambs as with all other growing animals, a full stomach and contented mind cause rapid growth and fine finish, which means, in the final, high quality. Too little attention is given to castration of the rams. This operation is a simple one and the financial loss resulting from a failure to perform it, is considerable. Ram lambs develop sexual characteristics when about three or four months old. They then become restless, worry the rest of the flock and fail to make satisfactory gains themselves; they can not be profitably kept for a favorable market. The 'fell' or papery membrane covering the carcass becomes strong and if not removed before cooking, has an objectionable flavor. Some of the ewe lambs may be bred to the poorest ram in the flock, the ram lambs become coarse as they grow older and the increase in weight iis confined mostly to the forequarters, neck and head, which are the cheaper cuts of the carcass. Wether lambs devlop in the loin, back and leg, or the high priced cuts; all of these points are considered by the buyer but not men tioned to the grower, except in price fixing. Lambs should be castrated when from eight to fourteen days old if they are allowed to become mhch older, the operation is much more severe. One of the best methods is to cut off one-third of the scrotum with a clean, sharp knife and force the testicles down. They should then be grasped one at a time with the thumb and forefinger and pulled out with the spermatic cord attached.

Many shepherds think it best to dock all lambs—ewe lambs when from eight to fourteen days old, and ram lambs from four to five days after being castrated. Docking prevents the accumulation of a great deal of filth at the rears and adds very much to their general appearance, giving them a more blockly and uniform appearance. Some flock owners are afraid to dock their lambs because they think there is a danger of their bleeding to death, but there is little danger if the operator is careful. If any lamb should bleed too much, a piece of strong cord should be tied tightly around its tail close to the body; this will check the flow of blood and can be removed in three or four hours.

The method of docking most commonly in use, and by many considered the best, is using a sharp knife. The best way to hold a lamb while being either castrated or docked is as follows: The assistant holds the lamb by all four legs, with the lamb's back firmly pressed against his breast In this position the operator can locate the second joint of the tail from the body, which is the proper place to dock it; as much of the skin as possible should be pushed back toward the body of the lamb so as to leave some loose skin to grow over the stub, then place the knife over the jont and give it a quiuck slash, when all is over in an instant and the lamb hardly realizes anything has happened to it.

Castrating and docking should be done in the morning, so the lambs can be watched through the day; then if one should lose an excessive amount of blood, it could be taken case of before it is too late.—By C. H. Crawford, Maine, State Sheep Specialist, Department of Agriculture

WATER FOR FATTENING HOGS

Any animal under heavy feeding of grain of any kind needs enough water taken itno the stomach to help in the process of digestion. Digestion does not begin until dry, hard food begins to soften from the action of the saliva and other fluids normally found in the animal, or by the help of water the animal craves, or will take as needed when the supply is available. The average hog grower fails to appreciate the high value of clean, fresh water always ready to meet the cravings of the animal sub sisting on dry feed.

Water is necessary for the complete digestion of all solid foods. It aids in the assimilation of feeds and besides there cannot be for any considerable length of time a complete elimination of the unasimilated or undigested foods from the digestive tract without enough water to make the masticated food soft enough to pass freely through and out of the animal. Scientists tell us that the reason why constipation is so frequently followed by scours is because the feverish condition of the bowels caused by a lack of water causes an abnormal flow of liquids to be turned from other parts of the body into the digestive tract to aid in the elimination of the undigested and unassimilated foods. The result is a loss of appetite and weight and a weak and unthrift hog. Such ailments may easily be avoided by keeping plenty of clean, fresh water where the hogs may have access to it at all times.

Pigs that are kept in pastures, where they have access to green, succulent grasses and forage crops do not suffer from a water shortage as much as those that are fed in dry feed yards and on dry feeds. If the dry feed needs considerable water to further the work of digestion the more succulent green feed will be

Dairymen replied "Amen!"

Gentlemen:—Your Suction-feed Separator is a wonderful machine. It skims clean at any speed, is easy to clean, runs smoothly, oils itself without mussiness, and delivers cream of even density at all speeds. It never gets out of balance as the disc-bowls do.

I cheerfully recommend the Sharples Suction-feed to anyone wanting the *best cream separator on earth.*

Yours very truly,
(*Signed*) L. C. SWEET
Alden, Minn.

MR. Sweet's letter covered Sharples Suction-feed advantages so definitely from the actual user's viewpoint, that a copy was sent to several thousand other users of the Sharples Suction-feed Separator. Each user was asked to comment on the letter. The response was unanimous:—"We say the same."

One type of Sharples Suction-feed Separator is electrically operated with current from farm lighting system.

It is costing you more to be without the Sharples Suction-feed than it would to buy one. Write for catalogue, addressing nearest office. Dept. 79.

taken after the dry feed of grain. Many feeders find that withholding water tends to induce fattening hogs to eat more forage. This extra use of forage and grass crops helps to balance the ration, so far as shortage of protein in corn goes, also the shortage of water, because such green feed contains from 80 to 90 per cent. of water, whereas the grain carries but 10 to 12 per cent. of water. But for breeding hogs and growing pigs one cannot go far wrong in allowing the animals to decide when he wants water and how much. Even if he drinks heavily enough to wash out his system a little of the excess of undigested and unassimilated feed he is wisely following the promptings of nature.

The pig's appetite is a safe guide to follow to determine how much feed he can eat and digest and how much water will be needed to eliminate it before it will begin to ferment and cause a disordered digestion. There is no feeder who can intelligently limit the amouunt of water the pig may need to promote the most complete digestion and assimilation of food. He can tell how much water the pig will drink if he has it before him, but by withholding water he is only guessing that the hog can be made to utilize more of the feed eaten if water is withheld, and he loses sight entirely of the importance of proper elimination of unassimilated and improperly digested feed that should pass away to insure the health of the pig. Neither hunger nor thirst favor health or economical gains. Those feeders who assume that water which makes up more than half of the weight of the carcass of the fat hog is less necessary than the dry feed in the fattening process will find that in the long run, the delay in the digestive tract by reducing the water supply will cause disorders that sooner or later will end in loss. W.M.K.

CARE OF EWES AND LAMBS AT WEANING

(Experimental Farm Note)

The ewe that has raised one or two lambs is never in high condition at weaning time as this is the hardest period of the whole season on the breeding ewe.

Lambs should be weaned by the last of August or first of September, and the ewes should then have the best of feed, such as good aftermath clover or rape. If this feed is not available, a few roots with a light grain ration should be fed in order that the ewes may be in good flesh before being bred, which will add very materially to the crop of lambs the following spring and also the condition of those lambs.

With experiments that we have con ducted it has been found that ewes that have not been "Flushed" but have just been kept on dry pasture until breeding, have not produced over 100 per cent. of lambs, where those that have been turned on clover or rape and fed a light grain ration have produced 150 per cent. of lambs which we consider is due altogether to the condition of the ewes at time of breeding. This is a point that every farmer should remember and put into practice as it is very profitable in sheep raising.

There is no time that mutton can be produced as cheaply as in the fall of the year after weaning the lambs. By weaning lambs early and running them on clover or rape pasture and feed them a light grain ration of one-half to one pound each of equal parts oats and barley with a little bran added, for larger gains are produced than leaving them with the ewes.

It is a recognized fact that no class of animals are put on the market in such an unfinished condition as lambs, for quite a large percentage of them are sold very soon after weaning, at a time when the market is practically over-supplied, where, if they had only been turned out on good clover or rape pasture with a light grain ration, they would have very profitable gains and also be in better condition, which would enable them to demand the highest price. J. A. McClary, Superintendent Experimental Station, Lennoxville, Quebec.

THE IDEAL GREEN FEED SILO is the dairy farmer's savings bank

The Ideal Green Feed Silo provides the ideal way of saving the summer's green, succulent feed for use during the winter months. It increases the productive capacity of the farm at least 10%, and often much more. It enables the cows to give 25% more milk than if they were fed on a dry feed ration.

The silage ration is considerably cheaper than a dry ration with hay and other feed at the present high prices.

A farmer said recently: "Two years ago I borrowed money to build my Ideal Silo. If I had done it ten years ago, my past two years' experience tells me I would now have my farm all clear of debt."

The Ideal Green Feed Silo pays for itself in a short time. It makes better silage, is better built, made of better material, and will last much longer than inferior silos. Thousands of Canadian cow owners have proved this to their own satisfaction.

Write to nearest office for catalogue, which describes the Ideal Green Feed Silo and gives valuable information about silage

THE HORSE

HEREDITARY UNSOUNDNESS

The enrolment of stallions for pub lic service has for its attainment the improvement of horse breeding through a standard of qualification for sires.

To accomplish the desired purpose the enrolment requirements are designed so as to eliminate as far as possible from public service stallion of undesirable type and poor conformation and to discourage the use of unsound sires likely to transmit the defects. The disqualifying forms of unsoundness are those considered to be of a hereditary nature, meaning an inherent diathesis or predisposition to defects likely to be transmitted to the progeny, thus interfering with their usefulness and lessening their value. In general experience it is found that an unsoundness present in a horse with structural weakness and poor conformation is very likely to be hereditary. In examining stallions for defects the following described diseases or defects should be thoroughly understood and carefully considered.

Bone Spavin or Jack Spavin

This is a bony deposit forming an enlargement which is noticeable usually at the inner and lower part of the hock. A spavin is always an unsoundness, as it may cause lameness at any time. Certain formations of hock are predisposed. particularly those which are small and weakly supported The hereditary tendency to bone spavin is beyond doubt, and it is therefore always considered as a disqualifying unsoundness in stallions.

Bog Spavin

is a soft swelling or puffy enlargement occurring on the front and inner part of the hock. It is due to the capsule of the joint being overdistended wtih the synovial fluid or joint oil. It does not always cause lameness, but is an unsightly defect in any case. In some strains of horses there is a decided tendency to bog spavin. It should be considered as a disqualifying unsoundness when present in stallions with short, weak hocks, or those which are bent or otherwise faulty in shape. Slight puffs on well formed hocks occurring only after considerable use at service or work, and after the age of eight years need not always prevent qualification as there may not be any undue hereditary tendency.

Thorouughpin

This name is given to a puffy swelling at the upper and back part of the hock It is due to an over-distension of the tendon sheath with fluid, and can be pressed through from side to side of the hock, hence the term thoroughpin It does not always cause lameness, and is most liable to occur in short, 'beefy' upright hocks and is frequently associated with bog spavin. They are regarded as hereditary, unsightly defects to the same degree as bog spavin.

Curb

This term is applied to a swelling or thickening on the back border of the hock, about six inches below its point. This thickened condition of the ligament or tendon is noticeable in the deviation of the straight line that extends downwards from the back of the hock. Long, narrow, bent or sickle-shaped hocks are known as curby hocks, and are very liable to spring a curb. Legs of this kind affected with curb constitute an unsoundness liable to be transmitted to the progeny, and a stallion so affected should be disqualified. A slight curb on a strong, well-formed hock need not alweys prevent qualification.

Stringhalt

is also termed Chorea, and is manifested by a peculiar spasmodic jerking upwards of one or both hind legs. The peculiar jerking movement may be slight or decidedly noticeable when the horse is either walking, trotting, turning or backing up. Some horses only show it when first exercised, and after a time drive out of it on becoming warmed up, while in otner cases it persists irrespective of the amount of exercise. The true cause of stringhalt is not known. To detect stringhalt often requires care ful examination and close observation of the horse in all its movements. Stallions showing decidd stringhalt should be disqualified, as it is a form of unsoundness with a decided tendency towards being manifested in the progeny.

Ring Bone

This name is applied to a bony growth forming an enlargement extending around the pastern. It may affect either the front or hind pasterns, and frequently causes lameness which persists. Faulty pastern are a predisposing cause, and in this regaid very long, weak pasterns and very short, upright pasterns are both inclined to the occurrence of ring-bone. It is one of the most serious rorms of unsoundness, and the hereditary tendency is acknowledged, so that stallions affected with ring-bone should be disqualified.

Side-Bone

This name is given to a hardened condition or ossification of the lateral cartilages, which are thin plates of gristle situated on each side of the foot to permit expansion at the sides of the hoof head. When they became hardened their flexibility is destroyed, thus preventing expansion and causing lameness in many cases. There is a decided hereditary tendency to the formation of side-bone, particularly in some of the heavy breeds, especially those with coarse legs.—C. Le McGilvray, V.S., M.R.V. Principal Ontario Veterinary College, Toronto.

Make Heavy Hauling Safe & Easy

Imperial Eureka Harness Oil
penetrates the pores of the leather—makes it weather proof. Unlike vegetable oils, it will not become rancid. It prevents drying and cracking and keeps straps and traces pliable and strong. Imparts a rich, black, lasting finish and makes harness look like new.

Imperial Mica Axle Grease
—is the most widely used axle lubricant on the market. Its mica flakes work their way into the pores of the axle, making it smooth and frictionless. Imperial Mica Axle Grease lubricates thoroughly under the most strenuous conditions. Makes loads easier to haul. Reduces the strain on harness and horses.

HORSES NEED SPECIAL CARE NOW

Many horses are killed and many more injured by careless feeding and watering. This waste in horse flesh occurs most frequently in the spring time when horse service is in most demand on the farm. The chief cause to emphasize is the way that some farmers attack spring work with unconditioned horses. It takes a right good horseman to finish up a team from winter conditions in fit shape for steady, active spring work. There are men that can feed horses to make them fat, in the same way as bullock are fattened, expecting that when the day comes for work they will be fully prepared. These men come forth to the field full of pride at the team's appearance. This pride is commend able, but if it is not balanced by sound judgment in regard to the necessary gradual training to the "full steam ahead" power, it will not avail much as a profitable unit of labor.

Full of Flesh and Firm

When the season is delayed by inclement weather it is calculated by the teamster that some speed will be required to overtake the lost time and the horses are full of spirit and take readily to the work. But in his anxiety to overtake the work the teamster forgets that the horses' ambition is out of all proportion to their power of execution when put to the plow, if they are expected to accomplish a full day's work at once. There are farmers who have not the ambition to have good looking fit horses, that put the blame for the failure of the good horse feeder upon the extra fat, and accordingly keep their own animals in thin condition by underfeeding. This, too, is a mistake, even a worse mistake than that made by the man who feeds his horses well. The result of putting soft horses to work is often sore shoulders, ambition extinguished and a waste of flesh which, if it had been hardened gradually, would have proved a valuable asset to the team and left the teamster confident that he had something to draw on for long-continued work as the days lengthened and the ground is less easily plowed. With a wrong start the team gets slower and slower and less efficient; what is needed is a horse in full flesh and firm.

Never Recover the Shock

Besides the general care and management of the horse at this season, the feeding demands great consideration. Acute indigestion or colic are the most common ailments among horses in the spring time. The horse generally gets more hay packed into his manger, on the assumption that more work will require more feed. Eating large quantities of fibrous hay and hard work immediately after will disturb the digestive system, laying the horse open to disease and lowering his staying power at hard work. The general rules in horse feeding are: Small quantities of good feed and regular feeding, feeding often and watering before feeding. Employ the simple principles of hygiene and don't work horses to exhaustion or expect a colt to do a day's work equal to an old horse. There are many young colts takken on in the spring time to augment the horse power of the field, and many of them never recover the shock they get from the overstrain in the sudden start and the injudiciouus feeding at the same time. A young colt requires to be trained in his feeding, previous to being hitched up for the first time. Stomach troubles at the start, or contracted in youth, stay with them all through life and materially reduce their value.

When the Horse Should Get Water

The writer's common, every-day method in horse feeding is to give the team all they will drink the first thing in the morning, then feed them their oats and hay, and generally they are not granted the time for over-eating at this period of the day. Horses should always be watered before they are fed. Never water a horse immediately after feeding grain This washes the grain through the stomach before it is properly mixed with the stomach juices, and is liable to cause colic. The fact that horses do not show direct income like the cow, is one reason why they do not get the same thought bestowed on their feeding and care, and therefore may be set down as the reason why horse barns are not generally supplied with self-supply water bowls. This small outlay would return 100 per cent. returns by the increased vitality and vigor of the teams.

When horses come in at noon hour they should not be allowed to drink all they want if they are warm; six to eight swallows is all that should be allowed. Neither should they be given a full meal when warm and fatigued. A full half-hour should elapse to give them time to come to normal, the nthe remainder of their drink should be given, which quantity will be all they require to slack their thirst. Then feed them their grain, and a very small quantity of good hay at the same time. Some horses choose to eat grain and hay in alternate mouthfuls and the hay and grain should be placed before them at the same time. The noon time hay should be of the choicest quality procurable. The evening meal should be more liberal with the hay, but if the horses come in warm, the same precautions should be taken with the watering as at noon time. Never forget during the evening in feeding the horse that he has not got his full drink of water and let him have it finished before you commence to feed him. If the stable is not furnished with water bowls before the horses, have a large part of water placed before them each night previous to retiring. The never failing rule in horse feeding is that they should always be watered before being fed.

Durable Tires for Country Driving

COUNTRY roads test the endurance of tires. Sharp stones that cut, round stones that bruise, and grinding ruts that scrape the surface, seem to have less effect on Gutta Percha Tires than on most others. This is because of extra strong, heavy fabric, thick rubber tread and a toughness that our rubber compounders know how to incorporate. Farmers, who drive big cars or little cars, will find that no tires will give a longer life of satisfactory service than

POULTRY.

THREE PREVALENT CHICKEN AILMENTS

March and April are the two great "chicken" months. If we want plenty of eggs in the autumn and throughout the winter, we should aim at hatching most of our chickens off during these two months. March to early April should see our sitting breeds hatched, April and early May our non-sitting breeds. In these notes it is obvious that a good deal of repetition must be employed, both for the sake of new readers and also for old readers who are just making up their minds to make their poultry fall into line with their other stock by bringing them up to date. If not a fortune, there is money to be made out of poultry, if only common-sense management, good feeding, and up-to-date methods are employed, for, in spite of the increased cost of feeding stuffs, the price obtained for poultry and eggs has also gone up, even if not quite in like proportion. There are not a good many chickens about, and so it may be helpful to give causes, symptoms and remedies for three chicken ailments which are sometimes rather prevalent in some poultry yards. Many chicks die annually for want of knowledge as to how to treat chickens when on the sick list.

Diarrhoea.—Causes: Usually injudicious feeding, wet or sloppy food; sometimes a cold snap will bring it on; stale food left lying about will encourage it. Symptoms: The frequent passing of watery or frothy discharges. Treatment: In spite of its price, salad oil is better than castor oil for small chickens; a dose of this is advisable. In addition, try doses of chlorodyne, say, one drop at a time in a teaspoonful of warm milk. Another remedy, often successful, is rice boiled and well dried off and sprinkled with charcoal in a powdered form. Powdered charcoal, always place within reach of chickens, is an excellent thing for them.

Constipation.—Causes: Food that is too concentrating; sometimes feeding solely on hard food; lack of grit as an aid to digestion. Symptoms: The vent crusted over with hard, dried-up discharges; later drooping wings, slow movements and general discomfort. Treatment: With warm water and a flannel soften and wash the coated vent; do not pull the matter away; be very careful, too, in picking it off, as it may cause the chicken a good deal of pain. Give the chick a dose of salad oil, but, if unsuccessful, castor oil must be used in these cases; some raw meat, chopped up very fine, is to be recommended; to the vent, too, apply some sweet oil. Constipation amongst chicks is very common, if we are not very careful about their feeding menus; supply plentifully powdered charcoal.

Gapes.—This is a dread disease, and not easy to eradicate. Cause: A small worm in the windpipe. Symptoms: Incessant gaping, difficulty in swallowing; speedy death if not cured at once; chicks will at times run backwards when thus affected. Treatment: There are two or three ways or treating chicks affected with gapes; two of these, usually successful, will suffice:—

(a) Take a feather, strip the quill to within a short distance of the end, and, either as it is, or treated with turpentine, pass it down into the bird's windpipe, give a sharp twist or two, and, on extracting it, some of the gape worms will probably be found adhering to the feather.

(b) Place the chicks, or, if a large number, some at a time, in a box and let them inhale the fumes from carbolic acid or chlorine gas; care must be taken when performing this operation. The fumes are deadly to the gape worms, but they may, too, seriously affect the chickens. However, if the chicks are removed at once on noticing any symptoms of staggering this remedy should prove successful. Do not let the chicks get at the saucer holding the properties which are to give off the fumes; a wire guard will prevent this.

There is always a danger in rearing chicks on ground where there has been an epidemic of gapes. The chicks manage sometimes to cough up these worms, but they will live and breed in the ground, and the old trouble will re-appear the next year. In such cases choose fresh ground on which to run the chickens, and alawys well lime the affected ground. These two precautions are essential. C. T. E.

Canada's Best Poultry Fencing
The shut-in and shut-out Fencing—a poultry fence strong enough to withstand the combined weight of two big horses. And that without a top or bottom board either. Our lock is the secret of its strength—a real protection to large fowls and little chicks too. If you are interested in such fencing, write us. Ask for our literature. We also manufacture farm fence and ornamental fencing and gates. Dealers nearly everywhere. Live agents wanted in unassigned territory.
THE BANWELL-HOXIE WIRE FENCE CO., LTD.
Winnipeg, Man. Hamilton, Ont.

BROODY COOP FOR POULTRY HOUSE

A broody coop made of slats should be in every poultry house. Then the broody hens needed for hatching eggs can be quickly removed from the nest and fastened up until broken. These coops should be portable so they can be taken outside for sunning and spraying. And in the summer when it is very hot in the poultry house, it may be best to place the broody coop outside in the protection of a shade tree.

Early hatching with hens may be more successful if only thirteen eggs

NEW PERFECTION
Oil Cook Stoves

Here's The Reason

—the Long Blue Chimney which supplies cheap, instant, speedy, clean cooking heat whenever needed. It has won for the New Perfection Oil Cook Stove the appreciation of hundreds of thousands of housewives.

With the Long Blue New Perfection Chimney, every drop of fuel goes into cooking heat—not into overheating the kitchen. The flame is applied directly under the utensils. There is no smoke or odors and pots and pans are not blackened. High, medium or low, the flame is always visible. It can be adjusted to give the heat desired and stays set.

The Long Blue Chimney which supplies the clean, white-tipped cooking flame.

A New Perfection Oil Cook Stove and a New Perfection Oven and Warming Cabinet form the best combination for year round cooking. *The New Perfection gives you more satisfaction in the kitchen and more time out of it.*

Sold by good dealers everywhere. Ask for demonstration of the Long Blue Chimney or write for New Perfection Booklet.

Her Best Friend

Back of most of the notable successes in the poultry field is

Pratts Poultry Regulator

the best friend of the industrious layer.

Fowls like it, because it makes them feel so good. Gives them a taste for their feed and starts them hunting the nest.

Poultrymen use it because it pays big profits.

At your dealer's. Booklet FREE.

Pratts

are given to the hens. The average hen of the American breeds can hardly protect fifteen or more eggs, and may be slightly chilled by turns if the hen cannot cover them all. Often they are crowded and broken. When fully as many chicks can be obtanied from thirteen as fifteen eggs, it surely pays to use the extra two eggs for another purpose. The large Brahma and Cochin hens can probably cover at least fifteen eggs at any season.

When feeding laying mash for eggs the producer sometimes keeps it up for two or three weeks and then stops because the increase in egg production does not seem large. Often the birds may have just reached the stage for profitable egg production when their balanced ration is cut down. Poultry cannot stand neglect and it costs more than ever to bring them back into condition after they are neglected. The only way to earn a profit is to keep them on balanced rations at all times. Then if they cannot pay their board and a profit, some other factor in the management is wrong, at least there is no hope for profit if the feeding methods are wrong.

CROWDING CHICKS IN BROODER

One of the mistakes that most beginners in brooder operation make is overcrowding. This is one of the worst mistakes one can make—a mis take that more often that anything else blights the success of the operator. A brooder rated at 50-chick capacity may be large enough for this number of chicks the first week or so, but as the chicks grow and develop they will be sadly handicapped by lack of space, and, as a consequence will not be able to obtain the exercise necessary to best results. It is not advisable to take the rated capacity of the brooder for granted, for the only time that the stated size of the brooder fulfills the requirements is when the chicks are small and they certainly do not remain that way very long. Two weeks' time make a marked difference in the size attained and the resultant room necessary for their well being. It is always advisable to buy a brooder double the size that it is rated at. Thus, if 50 chicks are to be kept in one brooder, select one of the 100-chick capacity. And it is never advisable to have more than 50 chicks in one brooder—25 is better. This does not apply to the stove brooders however, as they will accommodate most any number of chicks.

USE SONS OF BEST LAYERS

The most certain method of improving the egg production through breeding is to use only males that are the sons of known high producers. Males from hens which have laid more than 200 eggs in one year are of special value in transmitting the high-producing character to the pullets. Since the male furnishes half of the blood for the flock, much care should be used in choosing him. Farm poultry keepers can afford to pay a good price for a vigorous male from a heavy laying strain. Unfortunately, not nearly enough males from trap-nested stock are available to supply the demand for such birds.

Where a pedigreed male can not be obtained, the next best plan is to choose from a good producing flock an outstanding scrappy male with strong vitality. No proven method of picking out by physical tests the male which will transmit high egg production has yet been perfected, but vitality and egg production are closely linked and no male showing a weak constitution should be tolerated as a breeder. The strongest males can be easily detected by the marked evidences of masculinity, such as gallantry toward the hens, fearlessness in fighting, and a persistent tendency to crow lustily. The boss of the hen yard is usually the best breeding male.

A well-matured cockerel usually gives better breeding service than an older male, though good results can be obtained with strong yearling cocks. Many breeders use the same males to head the breeding flock for two successive years.

Where a valuable male is secured for the breeding flock, it is desirable that he be mated to the maximum number of females. The number of hens that can safely be allotted to each male depends to a certain extent upon the breed and the vigor of the male. A strong, fully matured cockerel of the medium weight breeds such as the Plymouth Rocks, Wyandottes, and Rhode Island Reds, can safely be mated with from 20 to 25 hens, while with the lighter breeds, such as Leghorns, one male will furnish good fertility whes mated with from 25 to 40 hens.

A Cough Won't Last Long

After You Start on a Bottle of

OLIVEINE EMULSION

The Great Health Restorer

You will get rid of the cough and get back your health and vigor just as quickly as did Mrs. J. A. Stonehouse, of Williamsdale East, N.S. who wrote:

"I took a bottle of OLIVEINE EMULSION last spring when I was in a weak condition and had a nasty cough. My cough left me and I also regained my health and strength."

This favorite home remedy is pleasant to take, agrees with the weakest stomach and is suited to every member of the family, young and old.

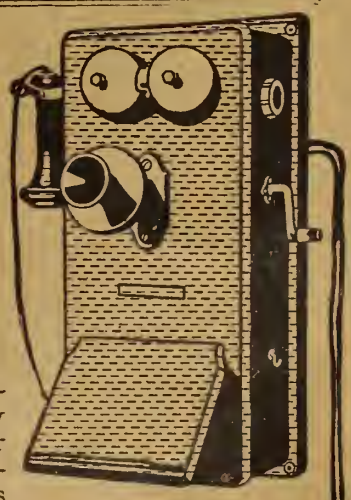
Economical to Maintain

You can't figure the cost of a telephone on the day you buy it — its the money spent for repairs that counts.



Stromberg-Carlson Telephones

are built better than may seem necessary to insure maintenance economy. The telephone, for example consumes less battery current while operating and gives better transmission than other kinds of instruments—which means less frequent renewals of the battery. When you pay less than our price you get less than our quality.

SEND FOR FREE BOOK No. 95

Shows you how to install and take care of your telephones—tells how to organize a party line among your neighbors and explains just how to get started. Gives valuable information about all Stromberg Telephones shows how our experience goined in building over 2,500,000 telephones is of great importance to you.

Send for this free book and put your telephone problems up to our engineers—we will plan your system and furnish estimates without cost.

Stocks carried at Toronto, Regina and Seattle

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Shbjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N. B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

What is true Greatness? 'Tis to clear
From sorrow's eye the glistening tear
To comfort there, to cherish here,
To bless:
To aid, encourage, and to cheer
Distress.
—George Frederick Cameron

"STIRRING UP OF PAP."

"Cold days come when hot days go," warned Pap Tisly, after emptying his mouth in the direction of the open Franklin.

"Sure do," agreed mam, removing her snuffstick. "But suthin' will hap pen. Always has done, an' always will. It's natur'. Ye ain't got faith."

"Faith a-plenty," denied pap. 'Tain't that. It's 'memberin' lack o' warmin' an' lack o' vittles while waitin' for the suthin' Stomachs has to be took keer of reg'lar, an' waitin' folks has friz. But I ain't one to be a-henderin' by myself."

"Know, he ain't." approved mam's soft, drawing voice. "I always said I was a good picker when husbands was stood up to be looked over. There's some in this 'ere neighborhood that's a trial to their famblies. But I'h hold out for two on the pig."

"Won't give it," said pap. "Ike, he hung on to jest the pig, a long spell, then climbed hard to a dollar. But he 'lowed he wouldn't go no furder."

"Ike's plumb gifted in carin' for his money," nodded mam. "But you stand for two, an' they'll come. Ike'll growl up to 'em, a few cents at a time. He wants the stove to set in his new cabin, an' is in a hurry to marry a wife. A man that-away won't dikker long, 'specially when dikkerin' saves money. Then Blindy's a girl like him ready to kill herself with work. She'll hump over that stove till it's same's new, an' Ike's a man who'll let her. Pig an' $2 make 'bout $5, an' the stove's wuth $10."

'Leven, the church aid woman said when they give it to us last winter," said pap. "An' it's same's new, 'cept for bein' dirty an' rusty. But the aid won't give us any more, lettin' this go."

"Winter days is a long way off," placidly, "an' summer cookin' in a fireplace is easy when one has young uns big 'nough to do the work. Temus can tote firesticks an' Lizy can 'tend the pot. Then they's dif'runt helps. Suthin'll happen. Always does. But if it don't of itself I'll start into a new church goin' an' will keep my needs afore it. Duty to young uns comes fust, an' ours ain't had a 'muse ment in gracious knows how long."

"This show's a mighty good one, the poster bills tell," reflected Pap, his face lighting some. "I look at the picture every time I walk to town. 'Couurse ye're right. Young uns has to be put ahead o' pers-nal comfort. But a dollar will pay for tickets."

"Not with extras—peanuts an' lemonade an' sich. We'd ought to do well by young uuns."

Pap nodded. "'Course we had. I'll hold on for the $2," he agreed.

Mam had been emphasizing with her snuff stick, prodding her ching, striking the palm of her hand or pointing it straight at Pap. It was Mam's way. Her voice was soft and drawling and rather ineffective by itself, but sertngthened by the gyrating snuff stick it carried weight. Especially did it carry weight with Pap His feeble indecision between the stove and the show vanished, and Mam, having no further need for the snuff stick as an argument ally, returned it to its legitimate use, The stick had one end split into a brush. A cigar box held her snuff. She dipped the brush into the box, twirled it for a good supply, and placed it in her mouth.

The next day the stove left and the pig came. Lacking a pen and the energy to build one, a long string was connected with one hind leg of the pig and a stick driven into the ground. It gave the young porker a range of several yards.

The Tisly place was an acre of unfenced, untilled, and uncared for land with a tipsy cabin that was uninhabitable except by a Tisly. An oak tree or two grew near the end, and for the scattered, half-buried acorns of these the hungry pig at once commenced an energetic rooting.

One day a week or so after its coming Temus rushed excitedly into the cabin. "Gold! G-o-l-d!" he yelled, dropping some glittering nuggets on the unplaned plank table. "They're all mine! I found 'em!"

The others crowded about him, trying to examine what he threw his arms over to guard.

"Shore 'nough, 'tis gold!" cried Pap ni an awe-struck voice. "I've heard it ought to be found in these mountings, though nobody ever did. An' now it's us. Where'd ye 'scover——"

"I ain't a-goin' to tell—mebby there's more," screamed the boy hysterically. "I found 'em. They're all mine."

"But mbbbe they's a reg'lar mine—a gold mine," urged bis father. "Was it on our land? Was it on the next j'inin'? S'pose somebody's sneak along an' see, an' jump in' an' call all the neighbors in? Then where'd ye be? They'd get the heft, an' a boy like you'd only have the pinch. Would n't ye ruther 'twould be all in your own family, so every one of us could be richer'n get out. Hey?"

Gradually the arms relaxed and the head rose. Temus was listening. 'I'd have the biggest sheer?" he queried suspiciously.

"Pig's sheer," mocked Lizy.

"I don't keer. It's——" Then he commenced to snicker. "Shore, pig's sheer," he agreed. "But, say—you ——"

For Lizy had suddenly plunged from the cabin. Temus snatched up his nuggets, jammed them into his pockets, and followed headlong. At the door he stopped and snickered again. "Ain't in the right place 't all," he confided to Pap and Mam, who were trying to push by him. 'It's pig sheer, sure 'nough. I found 'em round where it's been rootin' I'm willin' to show you all, but won't tell Lizy. I spect they's a-plenty more."

But a two hours' search revealed only one small nugget, discovered by Mam. The glittering object, small as it was, made her almost as hysterical as Temus. "Ground must be all et up with it," she ejaculated. "Likely all through the whole acre. An' to think that a pig brunug it to sight, a pig who don't root deep! If'd we'd a-planted taters or suthin' a-diggin' up of the ground, we'd be milliners by now. Temus an' Lizy could a' done the hard work, bein' young an' strong."

"Efrum Bill's Paw does their alls hard work for plantin," protested Temus. "Efrum Bill, he jest draps taters an' yanks weeds."

"But this wouldn't 'a' been real plantin'," said his mother. "Diggin' gold is dif'runt. Nobody feels hard work when it's diggin' of gold."

"That's so," admitted Temus readily. "LLet's start in now. It's 'bout tater time."

"Oh, hunky, let's," seconded Lizy. "I can dig. I'm a-goin' to buy an automobeel."

"I'm a-lookin' to a man's gun an' two more dogs," scorned Temus loftily. "I'll bring shovels—though ones handle is split."

"But s'pose folks should come by an' notice," said Pap with apprehension in his voice. "There'd be a gold stampede, like I've hearn tell on, an' we'd be crowded out. Better work fn the night. Ain't that so, Mam?"

"No, 'tain't," tartly. "You listen. It's 'bout tater time, like Temus said I'm goin' round to close neighbors an borry a few taters here. An' I'll borry a shovel or p'raps two. That'll tell everybody we're a'plantin,' which we will be, to keep sharp eyes from a-guessin.' An' doin' that-away, we can work day an' night. The sooner it's dug an' toted off the safer."

"How'll we get shet o' the gold, to buy things?" asked Pap. "Won't folk 'spicion?"

"Ain't goin' to get shet of it right to oncet. We're goin' to raise a loose board in the cabin floor an' pile it down there in a heap. Then we'll tote it to a city an' sell for city prices."

All nodded a hearty approval, for Temus was holding one of his nuggets in the sun, and the sparkle of it filled their eyes.

"Now listen furder," Mam went on "You three start to diggin' at the low end an' go all over the land, shovelin' deep—much as two feet, for I've hearn that gold is heavy and sinks down. Break up every chunk o' dirt fine, so's not to miss any sparkle. I'll hurry for taters an' things, an' will rake the ground and plant good, to fool anybody a-lookin."

The growing of the Tisly crop was a neighborhood joke at first, then a wonder. "Never seen ground dug so deep nor mellowed so fine," said one old farmer. "Must be some of old Granpaw Tisly's energy in 'em, after all. Mighty big crop they'll have.

They did, and it was a year of war prices too. But before any of the crop was harvested a great calamity, which spelled success, enveloped the Tisly's. Pa sold his gun and a dog for a trip to the city. He came back in a state of profund gloom to find an enterprising trader looking over the potatoes and truck. When the trader left, Pap went to the cabin, chuckling.

"Gold ain't no drug, I see," congratulated Mam. "An' we got six bushels under the cabin. Knew we's milliners.

"Not from Temus's gold, though," smiled Pap "His is iron pirates or suthin' thataway—'fool's gold,' they call it, too. But it don't matter. They's a heap better gold mine on our land, one that keeps a'fillin' when it's emptied out. Why, that feller out there come jest to see our truck, which he'd a-heard of. Offered $500 cash down as it stands, butu 'vis ed holdin' an' harvestin' as 'twould bring mebbe twicet as much more. Only he wanted me to promise him fust chancet to buy, which I did."

"Five hundred-" glowed Mam. This was definite money. "Whatever will we do wth t all?"

"I—I ought to have a sheer," whim pered Temus. "I found the—the pirates, which started——"

"I worked hard's anybody," claimed Lizy vehemently, 'An' I'm a gal, an are older'n Temus."

"I been considerin' it all," nodded Pap. "Comin' to the cabin I sort o' figgered this way: Namin' it $500 we'll put one of 'em into the four

PIMPLES and BOILS

For Nearly Two Years.

When pimples and boils appear on the face and body it seems as if the skin is the seat of the trouble but the real disease is in the blood.

Lotions and ointments may allay the trouble for a while, but seldom if ever cure.

You have to get under the skin; get at the blood which is the cause of the trouble.

Burdock Blood Bitters goes direct to the root of the disease and restores healthy, normal action to the different organs, and cleanses the blood of all its impurities.

Mr. E. C. Goodwin, Cambridge, N.B., writes:—"For nearly two years I suffered from boils and pimples on my face and neck, and nearly all of my body was covered with the pimples. I tried most everything, but got no relief. One day a friend advised me to try Burdock Blood Bitters, and after using three bottles the boils and pimples had all left me and there is no sign of them returning. I can strongly recommend B.B.B. to anyone who is troubled with skin disease."

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

acres j'inin' that my pap sold, one in to fencin' 'em off good an' proper, with a pig pen an' shed built, one for an old hoss an' plough an' some tools fifty for mam to buuy a reg'lar cookin' stove an' other fixin's, fifty to mend up the cabin, fifty to put aside for 'mergencies, an——"

"Oh, now, pap," wailed Temus and Lizy in protesting chorus.

"An' the last fifty," finished pap calmly, "for the two hard-workin' young uns', Lizy and Temus, twenty five apiece.

When the exulting tumult subsided enough for him to be heard again pap added simply: But what tickled me most was how the feller looked at me and shook my hand. Said we'd growed the best crop in all the country round an' that old farmers would better come and take lessons from us Think on't. An' them same old farmers have been laughin' at us right along. You wait an' see ms show 'em ag'in next year."

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

Gents,—I have used your Minard's Liniment in my family and also in my stables for years and consider it the best medicine obtainable.

Yours truly,
ALFRED ROCHAV,
Proprietor Roxton Pond Hotel and Livery Stables.

NEW RHUBARB RECIPES

Instead of simply stewing rhubarb try the following directions for baked rhubarb:

Rinse, wipe clean and remove the shreds from larger stalks. Cut stalks in short lengths into a dish with a cover. Scatter sugar over layers. Add one to two tablespaanfuls water. Cover, and cook in moderate oven until tender and deep red in color.

Jam made from the following recipe is inexpensive and delicious:

Select red stalks of rhubarb, as it makes the richest colored preserve. Take off strings of skin, but keep as much of the red underneath as possible. Cut the stalks into half-inch slices. Sover with an equal weight of sugar and let stand over night. For each three pounds of fruit add the grated rind and juice of one lemon. Let boil half an hour, then let simmer very gently another half hour. Seal in small jars.

Cook slowly one-half cup sago and one quart water until clear, then add one scant cup sliced rhubarb, pinch salt, one-half cup sugar and small piece ginger root; turn into buttered baking dish and bake about one hour in moderate oven. If the mixture seems too thick, add a little water. Serve hot with cream and sugar.

Mix one pint flour with one teaspoon baking powder and a pinch of salt, and add milk enough to make a stiff batter. Into buttered custard cups put one spoonful batter, then one spoonful prepared rhubarb sauce and top off with another spoonful batter. Steam one-half hour and serve hot with cream and sugar.

Rhubarb Jelly

Cut the rhubarb into pieces about one inch long, but do not peel it; cook it to a soft pulp in water enough to cover it; strain through the jelly bag, and allow 1 lb. sugar to each pint of juice; finish like other jelly.

Orange and Rhubarb Preserves

Take six oranges and carefully peel off the thin yellow rind; remove the white rind, and the seeds, and slice the pulp into a preserving pan, adding the yellow rind cut very fine. Add one quart of rhubarb cut fine, and 1 lb. to 1½ lbs. of sugar, and boil the whole down; put up like other preserves.

Rhubarb Vinegar

Crush the rhubarb, cover with luke warm water, and let stand 36 hours; then strain. Add 1¼ lbs. raw sugar or molasses to the gallon of juice, and also add a little yeast; keep it covered and in a warm palce for four weeks; then strain, put in a keg and leave it to ripen.

Rhubarb Pudding

Butter a pudding dish and line it with good suet crust rolled out to the thickness of ½ inch. Fill it with rhuborb which has been stewed for ¼ hour with a little moist sugar and the rind of half a lemon. Cover the pudding with pastry, rolled out to the same thickness as the sides, pinch the edges securely, tie in a cloth, and boil two hours, or until done; then turn out carefuly and cut a small opening in the top for the escape of the steam. Serve with cream.

Rhubarb Butter

To each lb. of rhubarb which is peeled and chopped, allow two cups of sugar; let them simmer together until it is done.

ICE CREAM FOR THE HOT DAYS

Philadelphia or French ice cream is the foundation of all creams; the former being made without and the latter with eggs, and is therefore richer. For a quart of the first mix four cupfuls of light cream with a cupful of sugar, and a pinch of salt. Flavor to taste and freeze. If fruit is added put it in after the cream is partially frozen, just beginning to solidify, and finish freezing.

For French cream make a custard of two cupfuls of milk, a cupful of sugar and four egg yolks. Let cool then add two cupfuls o cream which has been whipped, a pinch of salt and flavoring to taste. When vanilla flavoring is used some ilke the addition of a ittle grated nutmeg or powdered cinnamon.

A universal foundation is also used for water ices. This is made by boiling together two cupfuls of water and one of sugar until a thin syrup is formed, then beat until cold, which perceptibly whitens it. Add four well-beaten egg whites, flavor to taste and freeze. If not frozen hard it will be a sherbet. If solid it is a water ice.

Pineapple Ice

Use two cupfuls of shredded pineapple, either the fresh or the canned add two tablespoonfuls of lemon juice and mix with the plain water ice com pound. freeze. If you use the fresh pineapple, cut the top off straight, scoup out the pulp, and kekep the shell in ice water until serving time when pack the water ice in it, and replace top for a lid.

Berry Cream

Add two cupfuls of strawberry or raspberry juice and pulp from which the seeds have been strained to Philadelphia ice cream. Freeze. If peach ice cream is desired use two cupfuls of peach pulp. To get this pare and quarter peaches, then stew with a little sugar until soft, pass through a sieve.

Raspberry Whip

Whip a pint of cream, add half a cupful of powdered sugar, two cupfuls of mashed ripe raspberries and a pinch of salt. Freeze and elt stand five hours before using.

When Home Seems Good

A BLIZZARD OUTDOORS—warmth and comfort within. There is nothing in the home so necessary as a good furnace. Stoves and base burners are unequal to the task—they choke the air with dust and only warm parts of the house.

And buying a furnace is a matter of knowing how. The warm air heating system is the least costly. It is the most effective and healthful too. The

ENTERPRISE BLAZER WARM AIR FURNACE

will keep every corner of your home delightfully comfortable in all kinds of weather. It draws in the pure fresh air from the big outdoors, warms and moistens it and sends it on its way to you. Stoves and radiators can only heat the same air over and over.

Every part of the Enterprise Blazer Furnace is made just a little bit better than is necessary—the grate bars a little stronger—the fire-pot a little heavier. These are the things that enable us to guarantee that the Blazer Furnace will give you entire satisfaction.

Go fully into the matter with your dealer and write us for our free booklet "Warmth and Comfort"

The Enterprise Foundry Co.
Limited
SACKVILLE, N. B.
Makers of the well-known lines of Enterprise Stoves, Ranges and Furnaces 22

MAKING A SEWING SCREEN

A "Convenient Sewing Screen" made in the home at small cost will not only prove an attractive addition to furniture of the sewing room but will save many steps for the housewife by providing a repository for sewing utensils which will minimize the not infrequent misplacng and the irritating hunt for "that scissors or the black thread."

Make two frames about four feet high and two feet wide with slightly projecting ends. Cover one side of the frames with burlap or creton. Hinge the frames with the covering on the outside so that they form an ordinary household screen. Sew in pockets for scissors, darning needles, and other sewing implements. The crosspieces of the frames will provide a ledge for spools. A small cushion sewed on the burlap or creton will provide a repository for needles. A small swinging shelf hung from hinges to one of the frames and supported by hooks and chain when in position will add further to the convenience of the screen.

DO NOT DISMISS
CONSTIPATION
AS A TRIFLE. IT IS NOT.

Half the ills of life are caused by allowing the bowels to become constipated.

When the bowels become constipated the stomach gets out of order, the liver does not work properly, and then follows the violent sick and bilious headaches, sourness of the stomach, biliousness, heartburn, water brash, or the painful, irritating internal bleeding or protruding piles.

Keep your bowels regular with Milburn's Laxa-Liver Pills and you need never be constipated.

Mrs. C. Henderson, Trail, B.C., writes:—"I have been troubled with sick headaches and constipation most all my life. Have not now been troubled for a long time. I have great faith in Milburn's Laxa-Liver Pills since using them."

Milburn's Laxa-Liver Pills are 25c. a vial at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

RE PAINT BRUSHES

When paint brushes have become hardened and apparently useless, soak them for twenty-four hours in raw linseed oil, then for several hours in spirits of turpentine. If the turpentine is not at hand, use kerosene. Wash in warm water, and if the paint is not softened and the brush still sems stubborn and hard, put on the stove in an old basin or tin can with an ounce of washing soda in one quart of cold water. Let stand on the stove several hours where the water will not boil. Remove the brush from the solution and rinse. If too much washring soda is used the bristles will be surly. If the water is permitted to become too hot the brush will shed its hairs. If you are using paint brushes and do not wish to clean them to put away, let them stand in water in which there are a couple of spoonfuls of glycerine. This will keep them soft and prevent their freezing if the weather is cold. Sometimes painters let their brushes stand in linseed oil during the intervals of painting.

Has Tried Them Has Faith in Them

ERNEST SMITH TALKS OF DODDS KIDNEY PILLS

Quebec Man, Grateful for the Benefit He Has Received, Pays Tribute to Dodd's Kidney Pills.

Grand Pabos, West Que., June 8. (Special)—Mr. Ernest Smith, a highly respected resident here, is one of the many who have abiding faith in Dodd's Kidney Pills as a remedy for sick kidneys.

"I suffered from my kidneys," Mr. Smith says, "and I read that Dodd's Kidney Pills were good, so I tried them. They have helped me so much that I will continue to use them when my kidneys trouble me."

The kidneys require constant attention if good health is to be maintained and serious disease warded off The kidneys perform a most important work in the human system. They strain all the impurities, all the seeds of disease, out of the blood. When they are weak and unable to do their work the system clogs and sickness is the inevitable result.

Ask your neighbors if Dodd's Kidney Pills are not the best remedy for weak, disordered or diseased kidneys.

GOOD MANNERS FOR CHILDREN

While we are attending to the outer form of our social life, and prompting ourselves for the luncheons, teas or weddings that come our way, I wonder if at the same time we remember the seeds we are sowing at home? Do we try to plant those that will leave the least to be learned when our young shoots begin to go out among their elders?

Who is teaching restless little Polly to hold her spoon nicely between her thumb and first two fingers, or reminding Jack to lift his cap to the ladies his mother bows to, as well as to those who speak to him.

The earlier such habits are formed, hte sooner the germ of true courtesy will begin to develop itself, and your Jack and my Polly will be trusted to meet any situation with the poise and the grace that many elder people sigh for.

Their Early Upbringing

While no one wants to bring up children like little prigs, or make them fear the consequences of speaking before they are spoken to, it is possible for them to learn many little acts of courtesy as they learn to button their shoes, or before. It brings out thesir natural gentleness, and gives them a habit of consideration which will be an asset to them all their lives.

,It is said that people show their breeding by their table manners. But a child's correct behavior at table requires more patience than any other one thing demanded of him, so it is well to begin at the beginning and teach him the correct ways of managing his food before he has formed any habits.

It is much easeir for him to learn to sit properly at first than after he has discovered the comfort of lying on his arm on the table.

Many people nowadays are allowing the children a little recess betwen courses, to shorten the strain of remaining at the table with their "company manners" on. This is much better than allowing them to eat by themselves, as the restraint of the family's presence is very good for those same "company manners."

One of the first things children should be taught is to eat quietly, taking liquids noiselessly from the side of the spoon, and not clattering the spoon against the cup or plate.

How to Behave at Table

Those who are old enough to use knife and fork will learn to lay them carefully side by side on the plate, and leave the spoon in the saucer, not in the cup. They wlli learn not to play with the silver, not to look at people through or over a glass, nor to tip the glass or cup "way over to their nose.

They will ask politely for anything they wish instead of whining, "Mother, I want" so-and-so, and when asked will pass dishes nicely instead of pushing them along the table.

Children taught these elements of good manners, and taught not to soil their fingers any more than possible, will save the family's nerves and develop a daintiness that will make the further instruction in table manners a simple affair.

Next to table manners, children's behavior with grown-ups is a very important thing. There really is a moral qustion involved here, for the child's sense of responsibility is awakened and trained when there are older people to be rckoned with.

For instance, I know a little girl of four who knocks every time she enters one's room, and asks, "May I look at this?" whenever she picks up one of the hundred trinkets that appeal to a child's sense of beauty.

This child is not nearly as likely to develop that common streak of destructiveness as one who has not had the value of other people's property impressed upon her.

In the same way, a boy who has

FLEET FOOT

You See Them Everywhere

IN the country, as in the city, Fleet Foot is the popular footwear this summer.

Whether at work or play, Fleet Foot shoes are ideal for warm weather, because of their superior ease and comfort—their attractive styles—and their sound economy compared with leather shoes.

There are Fleet Foot colored shoes for work, and white ones for rest and pleasure. Ask your dealer to show you some of the Fleet Foot Shoes for men, women and children.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight aud dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home. without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall ouly ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

Read My FREE Offer

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis). irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten day trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309 Windsor, Ontario

A Picture of Satisfaction

The rich qualities of KING COLE TEA produce that genial glow of pleasure.

Perfectly packed in bright lead foil, and price marked on every package

"You'll like the flavor"

KING COLE TEA

How the Udder of a valuable cow was

saved

Chas. K. Robbins, of Cheboyne Point, Yarmouth, N.S., writes:—

"A recent experience in reclaiming what was supposed to be a lost section of a valuable cow's udder has demonstrated again the great worth of Minard's Liniment. I can recommend it in the highest terms to all who have a herd of cows.

"For years I have never considered my household stock complete without a bottle of Minard's. For burns, bruises, sprains, frostbites, or chilblains it excels. And I know of no better remedy for a severe cold.

"I think I am safe in saying that among all the patent medicines there is none that covers as large a field of usefulness as does Minard's Liniment. A real truism—Good for Man and Beast."

MINARD'S "KING OF PAIN" LINIMENT

Yarmouth, N.S. 8

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me today for free trial treatment.

A MESSAGE TO WOMEN!!

Mrs. M. Summers, Box 309 Windsor, Ont.

Advertise in the Farmer.

learned to speak gently and courtesly to his elders is much more likely to be chivalrous to his little sister than one who has never had that side of his nature appealed to.

Speaking Courteously

"I think so, Mrs. Jones," sounds better and can be made just as natural as "Don't know," in answer to a question. Then Mrs. Jones is instinctively more courteous to Tommy, and his attitude toward her becomes neither forward nor shy—both signs of self-consciousness—but is a sample of his natural self, gentle side uppermost.

If he thinks elder people treat him with natural courtesy and not with impatience nor condescension, it will be easy to get hm to rise when ladies enter the room, and remain standing until they are seated, or to offer his chair if, after th manner of boys, he has appropriated the most comfortable one in the room.

Little girls nowadays are being taught to curtsy when they greet older people—a very pretty custom and one that helps a child's self-possession.

Gradually the children's courtesy toward older people will be reflected in their treatment of their playmates.

Consideration For Each Other

The little boys should be encouraged to consider the little girls, and both should remember when they are hosts and when they are gusts. If a violent quarrel arises which the mother needs to quell, she must teach her children to preserve their dignity in their own home, and apologize, no matter where the fault lies.

It is a very dangerous thing to punish or even criticize other people's children. Sometimes children play together for months whose parents do not know each othr. If the playmates are in no way undesirable, this may go on indefinitely unless some event such as a child's party comes up. Then it is necessary to say, "No, Billy, I am sorry to say I can not ask Betty to the party because her mother has not called upon me."

Of course it is the older resident who has the "'privilege of calling,,' but it is the wise woman who makes it a point to know the mothers of her children's playmates.

CARE OF THE REFRIGERATOR

Keep the refrigerator clean and wash it at least once a week in summer and every two weeks in winter with scalding hot water in which you have dissolved half a cupful of washing soda to every two quarts of water. The drain pipe should also be cleaned with the long wire pipe brush that comes for the purpose. A regrigerator cannot be kept clean without it. After washing the refrigerator it should be wiped until perfectly dry. And the ice box should be cleaned as well as the shelves where the food stands.

Nver put warm foods into a refrigerator for the sake of cooling them off. They not only waste ice, but cause moisture. Chemicals and all foods that have an odor should also be excluded. Sometimes it is essential that foods with an odor be placed where there ic ice. If they must go in, cover them well. Fish may be kept for a while in a regrierator without imparting its odor to other foods, if it is wrapped carefully with waxed paper. Yolks of eggs should be covered. so as to prevent drying. Butter and milk, as they absorb odors, should be kept from dead leaves or anything that might possibly taint the atmosphere.

If the food is fresh when put into a refrigerator treated in this way, it can be kept for a reasonable length of time without danger of ptomaine poisoning.

Dampen a soft woolen cloth in ammonia, then in soda and rub each silver. To remove paint from window panes: Rub well with hot, sharp vinegar. silver piece thoroughly. Polish with a soft, dry woolen cloth. Use an old soft toothbrush, also, for engraved

NOTES FROM PRINCE EDWARD ISLAND

(Continued from page 665)

of shipping. The price at the diggers usually ranged from 20c to 24c per single horse load or from 4c to 6c per scoop full of from 400 to 500 lbs. of mud. Shell mud is a very economical form of carbonate of lime for land that is sour and in need of lime. But it should not be depended upon for maintaining the fertility of the soil. Light applications at reasonable intervals in conjunction with barnyard manure is good farm practice.—J. A. Clark, Superintendent Dominion Experimental Farm, Charlottetown.

CORN PLANTING

(Experimental Farms Note)

Indian corn, the peerless crop of the mixed farm, has a gradually enlarging sphere of usefulness in the Dominion of Canada. It is grown most exclusively in the province of Ontario; the corn growing line in the province of Quebec is gradually being pushed northward, and in several districts in the provinces of Manitoba, Saskatchewan, Alberta and British Columbia the corn crop is gaining in favour.

This reliable crop will grow on a wide range of soil provided always there is good drainage and a plentiful supply of suitable plant food. It is especially adapted to warm, deep loam soils rich in decaying vegetable matter (humus) underlaid with a porous clay.

In the rotation, corn should follow clover hay or pasture. It may also be grown after heavy or even follow a hoed crop, provided the soil is rich or a heavy application of manure has been made.

Fresh or green barnyard manure is the best plant food material, 12 to 15 tons per acre may be expected to give good returns. The application may be made in the fall, winter or spring. It may be worked in on top of the ploughing or ploughed under. The latter method is usually the most practicable and gives uniformly satisfactory results when properly carried out. The manure should not be buried too deeply in order that there will be the least possible chance for the leaching of valuable plant food constituents to depths in the soil beyond the reach of the immediate and future crops.

The aim in the preparation of the seed-bed should be to have it deep, moist, clean and fine. Clay land to be used for corn should ordinarily be fall ploughed, turning a fairly deep furrow but no deeper than the productive soil will allow. Sands and loams, shallow spring-ploughed, provide most favourable conditions for corn. Ploughed under immediately before planting, the sod, the growth of grass and the dressing of manure decompose rapidly, create a "hot-bed or warm condition" in the soil—necessary for the quick germination of the seed and the rapid growth of the plant, the secret to successful corn growing.

Moisture is a factor which must be duly considered in all seed-beds. No seed-bed is complete until the surface and sub-surface soil are connected, with the manure well incorporated so that there is no hindrance to the rise of soil moisture from the depths of the soil to where it may be available as required by the growing plant.

Hill and row are the two methods of planting. Hill planting 3 feet each way is recommended for weed infested fields since horse labour can be used to a maximum in the control of weed growth. It is also an advisable method where seed production is the aim or in short season districts, since hill planting is conducive to a quicker maturity of the crop than row planting.

Row planting 36 to 42 inches apart, is preferred on land in a good state of cultivation. No special machinery is required since the ordinary seed-drill answers the purpose and in harvesting there is less wear and tear on the corn harvester than is observed in harvesting hill planted corn.

The rate of seeding is an important consideration. For each hill from 3 to 5 seeds of strong vitality are sufficient. For rows, 15 to 20 pounds per acre of high quality seed will usually give a stand thick enough to permit of harrowing.

The right time for planting corn depends upon soil and weather conditions. It should not be planted until every indication of cold weather is thought to be past. Neither should corn planting be left so late that there is danger of an insufficient moisture supply and a too short season for growth. The right time for planting can hardly be explained. The experienced planter feels "in his bones" that suitable conditions exist. The beginner can acquire this knowledge only by observation and the exercise of judgment. The range of dates is between May 15th and June 10th.

The varieties of corn for ensilage to sow depend upon the district where seeding is to be done. The flint varieties including Longfellow, Compton's Early and Salzer's North Dakota, among the earliest maturing varieties, are therefore, suitable for the short season corn growing districts. In the longer season districts besides the flints already mentioned, the dent varieties, Wisconsin No. 7, Golden Glow, Bailey and White Cap Yellow dent prove satisfactory. In the Prairie Provinces North Western dent is popular.

Choice seed only should be used, this can be most easily procured by selecting from seed purchased on the cob. Test all seed for germination before planting in order that there will be no chance of too thin planting. Place the seed deep enough to be in moist soil. Following planting stir the soil frequently to mulch the surface, stimulate the germination of weed seeds and to destroy weeds. After the shoots are through the ground begin inter-row cultivation. When the plants are 3 to 4 inches high, and if too thick in the row, use a light drag harrow crosswise of the drills.

Keep the plants growing by maintaining a loose, mellow surface soil. Cultivate deeply at first and as the secondary root systems develop and spread just under the first three or four inches of surface soil between the rows, cultivate shallower in order that the root systems will not suffer injury through pruning and thus prematurely ceck the growth of the crop—W. L. Graham, Assistant, Dominion Field Husbandman.

SELF FEEDER FOR SWINE

(Experimental Farm Note)

One often hears the statement made that it does not pay to perhaps give pigs more than the most ordinary attention and the farmer can scarcely be blamed in this respect if his hired help is inexperienced and yet has to be paid as high a wage as a real good experienced man.

The keeping of a few pigs is practically always a paying proposition but, to make it more so, means must be resorted to whereby the labour can be reduced to a minimum, particularly as the pigs are apt to receive the scantiest of attention in any case. Towards this end, therefore, it seems only natural to try to find out just how well pigs will thrive if allowed to feed themselves. By feeding themselves is meant the adoption of a 'self-feeding' method whereby the pigs are allowed access to a limited supply of dry feed whenever they feel so inclined. This system is of value to the breeder who goes in for swine-raising on a large scale and also to the small farmer who has other countless duties to perform but fints the feeding of pigs the worst chore of all. The latter might find the 'self-feeder' of great value particularly in reducing expenses.

With a view to gaining some definite information on the use of the 'self-feeder' for swine, experiments have been carried on at the Experimental Farm, Agassiz, B. C., for several seasons. Comparisons have been made in the use of the 'self-feeder' as against the trough-feeding method. As far as cost of feed is concerned, results go to show very little differenee one way or the other, but when the labour question is considered the value of the 'self-feeder' cannot be ignored. This comparison of the 'self-feeder' with the trough-feeding method is being continued, until absolute and definite results are obtained but up-to-date, however, the advantages of the 'self-feeder' have been strikingly evident.

With all classes of feeders this device can be used to advantage while it also may be made use of in the feeding of young sows up to breeding age. With mature breeding stock, however, it is wise to avoid the use of the 'self-feeder.'

The 'self-feeder' for swine has many features to commend it, one of the most important being the fact that, of all farm animals, none adapt themselves so profitably to this method as do swine. Where only two or three pigs are kept, the use of a 'self-feeder' can hardly be recommended but, with more than ten pigs the adoption of a 'self-feeder' is well worth a trial. Finally, as a means towards the reduction of the labour expenses, the 'self-feeder' has a distinct advantage over hand-feeding methods.—K. MacBean, Assistant to Superintendent, Experimental Farm Agassiz, B. C.

CREAM FOAMING IN THE CHURN

After churning several hours I find the cream has only turned into a thick foam. I had the temperature 62 degrees when starting. What is the cause?

Foaming of cream in the churn may be due to too low or too high a temperature, or too long keeping slow or delayed churning is often accompanied by foaming.

You do not state whether your cream is separator or gravity cream. Rich separator cream may be churned at from 42 to 52 degrees. Gravity cream requires a temperature of 58 to 65 degrees in summer and 65 to 72 in winter. If your cream is gravity cream foaming in the churn will result if you have kept the cream on the milk too long or have kept the cream too long before it is churned. The cause of it is the formation of alcohol in the milk by the decomposition of the milk sugar, and the combination of the alcohol with the fat and the formation of a soap. When

Bissell Silos

Maximum results with beef or dairy cattle are impossible unless regular rations of green fodder are supplied. The Silo saves hundreds of dollars' worth of green feed, which can be fed when summer pastures are dried up, and in winter. We make Silos in popular sizes, air-tight, substantial, with all practical improvements. Pine or spruce staves preserved in creosote oil, two-step doors; steel hoops; every item and arrangement is correct. Bissell Silos are the best for the money. Let us prove it. Consult us freely. Literature and prices on request.

T. E. BISSELL CO., LTD
21 Mill St., Elora, Ont.

this happens no amount of churning will bring bututer.

To prevent this trouble, half a teaspoonful of baking soda may be stirred in the cream, and this should always be done, if you suspect this condition, at least one day before the cream is churned. If the cream is too warm for the particles of bututer to unite, foaming will result, and the remedy is reducing temperature by adding cold water; if cream is too cold add warm water, that is, if the cream is fresh.

PRODUCING WINTER LAYERS

(Experimental Farm Note)

Why should we produce winted lay ers? Because there is an increasing demand, not only at home but abroad for poutlry and poultry products. What has caused this great demand? There are several reasons which, when taken collectively, are very convincing why such a shortage should exist in poultry and, of necessity, poultry products.

Firstly, because Canadians are eating more eggs every year. Secondly, because there is a greater export demand for Canadian eggs and poultry to meet the demands in foreign countries—the latter having been depleted of their laying stock during the war, thirdly, because of the high prices of feeds and the comparatively low prices of market poultry during the third and fourth years of the war, meant that a great many laying hens had been killed off. Fourthly, because not sufficient attention had been given to the hatching of early chicks for winter layers. Consequently the poultrymen found their returns were not sufficient to meet their expenses, and th increase in poultry raising has been very slow to what it might have been, had there been sufficient profits realized out of the poultry industry.

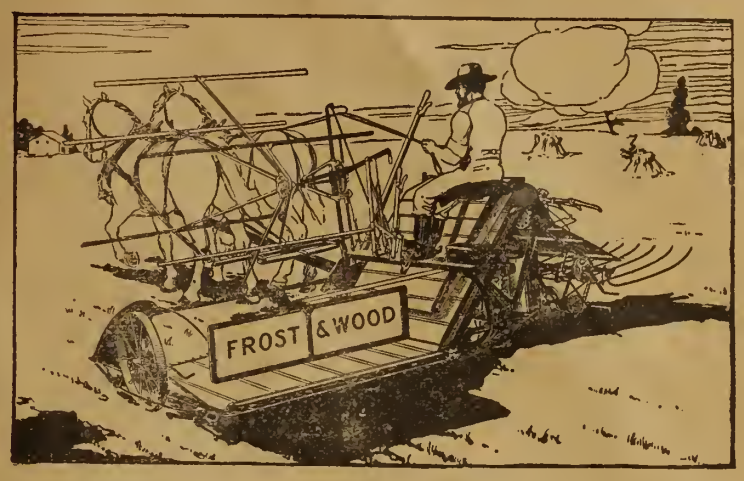
While it is not intended to mislead you into the fact that big money can be made out of poultry and their products with the prevailing high price of feeds, yet this can be said, that your returns may be increased very materially by producing winter layers. The following results, which were obtained on the Experimental Farm, Nappan, from five of the best winter layers, also five of the lowest, from October 1st 1919 to March 31st 1920, will bear this out.

The five best birds laid 413 eggs at a total cost of $8.21. The total value of eggs laid and sold for eating was $23.78, leaving a profit of $15.57. The lve poorest laid a toa total value of $1.99, making a loss a tota vaule of $1.99, making a loss of $6.11 for the six months. Figuring on a basis of 100 hens like the first five, you have a profit of $312.00 against a loss of $122.00 from the latter. In computing the above, only the actual food consumed is taken into consideratin—labour and interest on investment neglected. Now it can readily be seen that the winter layer is by far the more profitable hen to have. More especially when the high cost of feed is taken into consideration.

In order to produce profitable winter layers, we must select eggs for hatching from not only our most healthy and vigorous birds, but from our best laying strain. Hatch these along about the first of April and not later than the last of April. When the chicks are hatched, great care must be taken that the baby chicks do not get stunted. otherwise, they will not be as good as later hatched birds at maturity. Keep brooders and brooder house clean, light and free from dampness and draught. Give them plenty of wholesome chick food such as baby chick scratch grain, baby chick grit, oyster shell, charcoal and sprouted grains. Keep an even temperature at all times during the early stages, for that is the most critical time in the development of the winter layer. Keep them growing well throughout the summer. Do not over crowd your house. Feed plenty of good growing feeds, such as grain mixture of 200 lbs. cracked corn, 200 wheat, 100 of oats, together with a dry mash mixture of 100 lbs. bran, 100 cornmeal, 100 crushed oats, 100 shorts and 20 lbs. of beef scraps, keeping at the same time penty of grit, oyster shell and charcoal where they can have access to it.

During September, select your most promising pullets from the flock and get them into their winter quarters in order that they may become accustomed to their new surroundings. For winter quarters the house or pens should be light, free from draught and dampness and have plenty of fresh air. A good winter ration for the grain mixture is 200 lbs. corn, 200 wheat. 100 oats, and 100 of barley and dry mash, 200 lbs. screenings, 100 bran, 100 shorts, 100 cornmeal and 20 of beef scraps. Hens should always have plenty of grit, oyster shells and charcoal before them and in this way you can easily double your poultry profits.—W. W. Baird, Superintendent Experimental Farm, Nappan, N. S.

Frost & Wood



The Binder has one of the most important farm duties to perform and it must have strength, durability and proper design. It must also have light weight and light draft to do a lot of cutting in a short time.

Frost & Wood Binder

Eighty years of field experience are behind this Binder. It will cut, elevate and tie the lightest as well as the heaviest crop. Its wide range of lever adjustments makes it the ideal Binder for lodged and tangled crops.

Our use of high carbon steel and smooth running roller bearings at all friction points means light draft. The strong, well-balanced, rigid power frame makes a durable, non-sagging foundation for the cutting, elevating and binding mechanisms.

The elevating capacity is very large—it will handle the heaviest crops without clogging. The reel is flexible and very easily operated. The knives work smoothly. The Binding attachment parts are simple, easy to get at and ready for hard work year after year with a minimum of attention or adjustment.

Built in 5', 6', 7' and 8' widths. Tractor hitch supplied if desired. There are seventeen good reasons for the tremendous popularity of the Frost and Wood Binder. Let us send you our Binder pamphlet and you'll understand them.

THE FROST & WOOD CO. LIMITED

TRURO ST. JOHN CHARLOTTETOWN

THE MANUFACTURE OF CLOVER SILAGE

(Experimental Farm Note)

We are but beginning to appreciate the value of clover silage in modern stock feeding. When properly made clover silage is an excellent feed for nearly all classes of live stock. Aside from its higher protein content, it has an advantage over corn silage in point of lower cost of production. The yields of clover compare favorably with those of corn when the land has been equally well prepared.

Seldom are fields seeded down to a purely clover mixture. Usually some of the standard grasses are added. On the Agassiz Farm we use a mixture containing red, alsike and white Dutch clover, also Italian rye and orchard grass. This makes good silage but the greater the percentage of clover in the mixture the higher the feeding value, and the easier it is to make a silage of good quality. The grasses are inclined to be more wiry, stiff and dry, thus requiring more weight to press the mass firmly into the silo to exclude the air.

The most common practice is to cut the clover for the silo when in full bloom, that is, when right for hay making. Care must be taken not to leave the harvesting period too late. It is better to err on the early side rather than postpone the cutting too long. While the plants are young the stalks and leaves are more tender and break up more easily. There is also the advantage of obtaining an earlier second crop. Only as much should be cut at one time as may be placed in the silo during the day. The mower should be started early in the morning while the dew is on and followed at once by the rake. The clover should not be left to wilt between cutting and siloing. If severe wilting does take place better results are obtained by adding water. The clover ought to feel wet as it drops in the silo. Frequently attempts are made to make silage out of clover after it is spoiled for hay. Thsi is a poor policy. Partly spoiled clover makes very inferior silage as it loses its color and likely decay has begun.

Clover silage has been made with some degree of success by placing in the silo without cutting. This should not be done if it can be avoided. Not only is there less liability of the clover spoiling when cut into short lengths but it can be placed in the silo and also removed with much greater ease.

The knives on the cutter must be kept sharp and set to cut approximately half inch lengths. It is a good plan, where possible when siloing clover, to put a layer of corn on top to weigh down the mass below and secure a more thorough packing and thereby also a better quality of silage.—W. H. Hicks, Superintendent Experimental Farm, Agassiz, B. C.

ORANGE CREAM

Add a cupful of orange juice and half a cupful of orange pulp to the Philadelphia ice cream mirture. Flavor with a teaspoonful of vanilla and a tabespoonful of lemon juice, freeze. Serve in orange skin.

SUPREME REVELATION, DIVINE COMMAND, SUBLIME INCENTIVE

(Continued from page 666)

profiteering and no cause for action They are a sham, their salaries increase the white man's burden. Let me cite a case to point. There is a seed imported from Denmark we use quite extensively. Our Moncton seed houses do not handle it but right under the nose of the Board of Commerce in Toronto, a firm lists it at $1.00, 90 cts., and 50 cts., respectively while I buy the same seed, same brand for 25 cts. Are we just in giving that 75 cts. to the rich and then charging it to the poor? Have a care lest in the day that God dams the profiteer we by our carelessness are not reckoned accessors after the facts. He will avenge the fatherless and widow. Surely we are not loving mercy if we by negligence cause the poor to suffer. Love mercy—do justly.

Sublime Incentive

III.—A sublime incentive, "Walk with God." Oh the honor, the dignity, the glory to walk with God. Wisdom asks "How can two walk together except they agree." Lover walks with lover; their aims, desires aspirations blend; their companionship is congenial because of oneness of purpose. Walk with God in nature. De Weeks tells a story that illustrates my point. A new wharf had to be built. By an oversight a part of a pier of the old wharf had been left. It was so close to the new they dare not dynamite it. Chains were fastened to it and a tug procured, but their best efforts to move it failed. A canny Scotchman taking in the situation offered to remove it for a sum. The deal was closed. Sandy immediately procured two large scows placed one on either side of the obstruction, placed two large timbers across them, attached the chains around the piece of pier and tightened around the scantling, lit his pipe and sat down. "What now Sandy?" said one "I have a partner, the Lord. I have done my part, I am waiting for him to do His." Soon the tide began to come in lifting the scows and on that straight lift doing what the side pull alone could not do floating the obstruction. Work with the God of nature. Don't use driving horses for truck; dairy cows for beef, gravel hills for hay, heavy clay soil for orchards, don't educate your boy for city life and then hitch him to a farm Work in line with the God of nature. If thou be wise thou shall be wise for thyself for nature will treat all fair; you cannot break her laws and escape.

Walk With the God of Grace

Walk with the God of grace. Here to they that honor Him he will honor while they that despise shall be likewise esteemed. A few years ago two farmers, an infidel and a Christian were living side by side. The infidel sowed his corn on Lord's Day, cultivated it on Lord's Day, reaped and threshed it on Lord's Day, while the christian revered God and his day. When the grain was measured the atheist had 50 per cent more than the Christian. He wrote a letter to the local paper, boasting of his success. Promptly the editor published the same adding the footnote: "God does not always settle His accounts in October." Again the infidel's letter appeared in the paper with the editor's note and this added information. "Four years ago we published this letter and note. Since God has at least partly settled the account. The infidel's barn has been struck with lightning and it and all its contents burned; his only boy has committed a nameless crime and is now serving a 20 year sentence in the penitentiary; his wife is now in the state hospital. He has just passed the office door the most dejected man on God's earth. The Great Eternal will scan our lives, audit accounts, and settle all bills in the realm of both nature and grace.

Walk kwith Him who went about doing good. He went to a wedding and all were happier because He was there. Walk with Him who went to the grave and shed tears of sympathy and mourners by Him were comforted. Walk with Him who blessed children; with Him who soweth righteousness shall be a sure reward. Walk with Him who did kind things so kindly it seemed His heart's delight to make poor people happy from morning until night. With Him who communed with God in prayer. Cold mountain dew and mid night air witnessed the fervour of the Saviour's Prayer. With Him who had compassion on the hungry and fed them; with Him who sought to bring men nearer to God and thus nearer to each other. Walk with Him who at Jacob's well broke the swaddling bands of religious strife and racial hatred. In this day of extravagance, sport, pleasure, waste, seek His companionship, who commands "redeem the time for the days are evil;" seek Him who said: "Gather up the fragments, let nothing be wasted." "If I seek Him, find Him, follow, what my future here? Many a sorrow, many a trial, many a tear. If I still cling closely to Him what have I at last? Suffering over, labor ended, Jordan passed. If I ask Him to receive me will He say me nay? Not till earth and not till Heaven pass away. Finding, following, keeping, struggling, is He sure to bless? Angels, saints, apostles, martyrs, answer yes." As you go forth to your daily vocation hold the mandate of my text and may you so walk with Him here that one sweet day you shall walk through the pearly gate into the land of eternal felicity where white-robed, palm-branched, victor-crowned, you shall know that for your highest good God commanded "do justly love mercy and walk humbly with the God."

BIG COUNTRY CHURCHES

(Continued from page 667)

night the young men of the church orchestra come in from the farms to practice. Wednesday night the church choir of twenty eight young men and women from the farms comes to practice. Thursday night Father Moenig talks to the boys. Friday night the choir meets again.

Those weekly talks to the boys of the parish began ten years ago when Father Moenig got hold of Henry Wallace's clover book. Clover was not grown in the parish then, and to get them interested in it the priest preached about clover and brought the boys together once a week and read that clover book to them.

"Since then the boys and I have gone through many subjects together," Father Moenig said. "I have taken them through courses on bees lime, soil washing and crop rotation. Oh, they have been through many things in ten years. Since then many of my boys have grown up to be farmers and are practicing things we learned together in our Thursday-night readings and talks. I always try to make the subject interesting, so as to hold their attention and make them want to come. When a boy is plowing he will think of that and it will keep him out of mischief. Just now we are on electricity."

The Peach Orchard Campaign

Father Moenig had a professor from the state university come last month and explain all about storage batteries and the X-ray. In his own home he has an electric-light plant, and a gasoline-gas plant for cooking. He put them in to show them to farmers, and now they are putting them in.

When A. I. Foard came as county farm agent last June, Father Moenig sent for him to come to New Hamburg and help him organize a boy's peach club, and to get farmers interested in planting peach trees. He had found that the soil and sheltered valleys of his parish were excellent for peach growing, and his idea was that the hills there ought to grow all the peaches eaten in the lowland country round about. So he had all the farmers out to hear Foard, and before the meeting was over farmers had agreed to take more than 500 trees They will be set out this spring and a man of the neighborhood will be appointed official sprayer for all the orchards that are to be planted.

"You come back here five years from now and you'll see a peach orchard on every hillside," the priest said to me.

One side of his living room is filled with books from everywhere about farm and country life. There are books about flowers and plants, bees

A "Neponset" Roof or—?

THE roof, exposed as it is to nature's various moods, should receive the greatest consideration—a little extra thought spent on the roof more than pays in years to come.

NEPONSET PAROID

plays an important role in "roofing Canada." Thousands of roofs throughout the Dominion are covered with this long-lasting material.

Any person who has used Neponset Paroid will tell you that it is the premier roofing material in Canada. It combines durability with hard wear; is not affected by weather; and compared with the cost of wood and metal shingles, or slate, it is by far the most economical roof you can lay.

The base of Neponset Paroid is a high-grade rag felt, thoroughly impregnated with asphalt, making it positively water-proof and fire-resisting.

Easy to lay—With every roll of Neponset Paroid is supplied sufficient nails and cement with full directions.

There is a Neponset dealer in your district. Write us for his name and a copy of our illustrated booklet "Roofing Canada."

and birds, farm animals and farm tools, fruit and vegetables, canning and preserving, farm housework and farm tillage, and many hundreds of others. He has read them all.

"Here is a book just from Germany," he said, fetching it to me from a shelf. "Oh, I wish someone would translate it and print it in English so that everyone in America might read it. It is the most fascinating book!" He held it up and patted lovingly its green-covered back. "There are a hundred talks to my boys in that book. The German professor who wrote it saw everything in the fields and woods and lived close to Nature and to God. It tells why the leaves of a tree lie flat, and here"—he turned the leaves till he came to a page he had marked—"here it tells how each tiny rootlet of a tree has a tough, sharp-cutting shield at its end, like a plowshare, to push through the hard earth. Oh, its a wonderful book. You ought to come some night and watch my boys how interested they are in all these things."

I had forgotten to ask him if his church was in debt, and if the people gave freely to its support. I asked him then, as I was about to go. He shrugged his shoulders

"Ah- money! I never think of it. I never have to. The church has not had a debt in fifteen years. It takes care of itself I never ask about it. The people are all loyal to it and when money is needed it comes in. In fact," he said, as he laid the green covered book down, "most of my sermons are not preached in the church at all. I preach there only on Sunday but I am preaching many times a day, and every day in the week, outside the church. When I go into a man's barn to help him with the cows I am preaching to him. When I go into his field with him to help him terrace a hillside or plant an orchard or to get a greater yield of wheat, I am preaching sermons, the most fruitful sermons you can imagine.

"Oh' I wouldn't want to live if I couldn't be doing something like that to help bear my people's burdens and make them lighter. I love to mix with them and minister to them in that way. A boy on a farm is no good till he can sit on the fence alone and see God in Nature all round him. If he sees nothing but drudgery in farm work he is lost. When you can get him to see something to love in his work, when you get him to see God is working with him, then you have taken the drudgery out of it for him and ennobled it and made it sacred. Ther is nothing more wonderful than Nature, and the farmer is so closely related to it.

"I had a friend, a priest in a country parish like this, and he complained to me that he was lonesome. I took hold of him and showed him how to be interested in agriculture, how to see beauty in it, how to help, how to be priest, pedagogue and physician, all in one, to his people. Now he is enraptured with his work, and his people love him, and his church is crowded at Sunday worship.

"You wonder at the great congregation in my church, and at the orchestra, and the singing, and the devotion there. Listen!"

We were standing at the gate and I was about to say good-by. He laid one hand on my shoulder and with deep earnestness he said, as he pointed to the near-by church: "That worship in the church, that wonderful music, that intense spirit of devotion—all that is only the expression before God of what we have all been feeling and living all through the week in our daily work in the barns and fields and in our homes. The great sermons are preached to us by the living and growing things all about us, and we gather there on Sunday, in the presence of our Lord, just to commune with Him for a little while and get closer to Him, and to thank Him for His goodness and love and tender mercy."

As I turned a corner in the road and looked back the good priest was standing yet in his gate, in the twilight, listening, and from the church tower above him:

Softly the Angelus sounded, and over the roofs of the village
Columns of pale blue smoke, like clouds of incense ascending,
Rose from a hundred hearths, the homes of peace and contentment.

RATION FOR COLT—STERILITY IN MARE

J. G.—(1) What is the correct quantity of oats for a foal the first winter also what quantity of hay? (2) Mare, 9 years old, was bred this season and in 1915, but has not got in foal. What can be done?

Answer—(1) The proper ration for colts, during the first winter, would be between two and three pounds of oats, or roughly speaking, about two quarts per day. The amount of hay allowed should be a sufficient amount for the colt to clean up, which, on an average, would be about four or five pounds per day. (2) Mares sometimes become sterile, or barren, as the result of some altered condition of the womb or ovaries, and in order to determine the exact seat of the trouble, an examination by a veterinary surgeon may be required. In the case of the ovaries being diseased or cystic the condition might be remedied by rupture of the cysts by the hand inserted in the rectum. This operation, however, could only be done by someone skilled in the work. When the womb itself is the seat of trouble, an examination by a skilled person might determine the cause of trouble, which might be due to some occlusion of the neck of the womb, or some catarrhal condition of the womb itself.

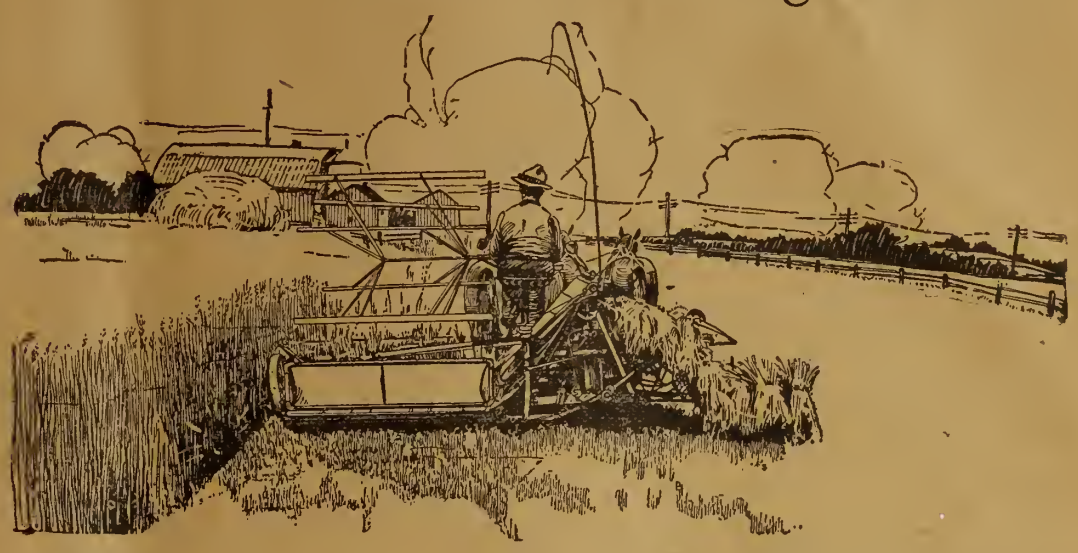
CARS PER CAPITA

Automobile registrations in Canada tion in the world. With an estimated population of 8,835,000 people there is a motor vehicle for every twenty-six persons in this country. In the United States the proportion is one car for every twenty inhabitants.

In European countries there is a preponderance of motor-cycles and by taking into account only passenger cars and commercial trucks owned in the principal nations of the world, the following list shows the ratio of motor vehicles by population in each country:

United States, per capita.....	20
Canada, per capita	26
England, per capita	268
France, per capita.....	402
Germany, per capita	684
Italy, per capita	1000
Austria, per capita	2700
Russia, per capita	5300

Make Short Work of Short or Long Grain



WHEN some of your grain comes up short and stunted, especially on dry, gravelly knolls, and some of it grows tall and heavy, so that it lodges and tangles—*then* you have a harvesting problem—unless you own a **McCormick** or **Deering Grain Binder.**

With these binders it is possible to cut short stubble—get right down close to the ground. The curve of the guards and wide range of platform adjustment permits doing this. And the reel is designed to handle grain in any condition. It can be lowered, raised, swung forward or thrown back almost instantly to accommodate short, long or tangled grain. The binding attachment can be adjusted quickly for short or tall grain, and has a wide band-placing range, so that the tie can be placed in the middle of the bundle if the grain is at all suitable for cutting with a binder.

The names **McCormick** and **Deering** are favorably known wherever there is agriculture. They are guarantees of high quality and operating efficiency. Almost 90 years of harvesting machine development and satisfactory service in the fields of the world stand behind them.

See your nearby International agent **now** in regard to your binder for early delivery. Place your reliance also on **McCormick, Deering,** or **International high-quality twine.** Meanwhile, may we send you a descriptive catalog showing latest improvements and features in the world-standard harvesting machines?

TO OWNERS TESTING HOLSTEIN —FRIESIAN COWS FOR ADVANCED REGISTRATION

Rules as Revised by Executive Committee

Feed and Drink—5. (Former rule on page 14 of Hand Book). During the official test period, no condiments condition powders, tonics or drugs may be given any cow; and no other liquid than pure water may be given as drink during the continuance of any official or semi-official test. Dry food may be softened with water or molasses, but with no other liquid; salt, sulphur, or charcoal may be fed either separately or mixed with the feed. But nothing in this rule shall be taken as forbidding proper medical attendance, either by a regualrly qualified veterinarian or by the owner or person in charge, upon a cow taken suddenly ill. In any such case the owner of the cow, or person in charge, shall make a statement in writing, over his signature and affidavit, describing the condition of the cow, and reporting all medicines given, which statement shall also be signed by the veterinarian, if one be called. The supervisor of the test shall also, over his own signature, add to the statement the declaration that to the best of his knowledge and belief, the conditions were as stated, and that he approved of the treatment given the cow. Such statement and declaration shall be considered as forming part of the application for entry of the record in the Advanced Register. Any sick cow requiring anything more than what might be termed "first aid," as for some acute ailment, must be taken off test.

It shall be allowable to blanket a cow only for the purpose of protection from cold; blanketing to any further extent, especially if making the cow uncomfortable or causing her to sweat, is forbidden. Nothing in this rule shall be construed to authorize or permit, under the guise of medical attendance or for any reason whatever, the giving or administering externally or internally, of any drug, stimulant or medicine, or any substance or thing in the way of feed that may produce any fever or abnormal condition in the cow, as evidenced by high per cent fat in the milk, or any condition inconsistent with normal dairy husbandry. Abnormally high per cent, fat accompanied or followed by marked decrease in milk production shall be held as prima facie evidence that nitentionally or unintentionally the spirit and intent of this rule has not been complied with by the feeder; and no report of test showing such indication shall be accepted to entry in the Advanced Register.

And if it shall be ascertained at any time that the spirit and intent of this rule has been wilfully violated or evaded, then, in addition to the rejection of the test, any person so violating this rule shall be excluded from, and denied all privileges in, this Association; and if he be a member, he shall be expelled from the Association. Should it be found that any test made or influenced by any means in violation of this rule has been accepted to advanced registration, it may be expunged and cancelled off record.

Addition to Rule 7.—(See Rule 7, page 26, of Hand Book).—Should any owner or person in charge neglect to make his monthly milk reports promptly as required by this rule, the Superintendent of Advanced Registry shall twice call his attention to the oversight, explaining the requirements of the rule and penalty for non-compliance; and should the owner for any reason other than absence from home or illness thereafter fail to make his monthly reports prompty, such failure shall automatically debar the owner of the herd from any prize money offered by the Association for semi-official tests. In making reports of monthly credits to owners, the Superintendent of Advanced Registry shall follow the regular order until the reports for any one month have been made. Should any owner before the reports for any month are all completed desire a report of credits falling due in the succeeding month fo any cow, he shall be entitled to such report on payment of a fee of $1.00 to cover the extra cost to the Association of making such reports out of regular order.

In the body of Rule 7, the time allowed for making milk reports is the first ten days of the month following the month in question; and this ten days is now cancelled five days, making it fifteen days. In the revise of the feed and drink rule, an effort has been made to so word that rule that it shall express the thought and intent the former rule was intended to express.

Delavan, Wis., February 15. 1920.
—Malcolm H. Gardner, Supt. A. R.

THE HANDLING OF HIDES

One of the chief factors in determining the value of hides is the quality of the take-off. In the trade the removal of hides is the work of specialists, while in the country, skinning is only an incident in the general work of the farmer, or local butcher. For these reasons the hide removed by the trade is generally superior to the country hide, not only in the take-off but as well in the salting and packing. The difference in quality is indicated by the classification of hides as "Packers" and "Country."

An outline of the essentials to the marketing of good quaity hides may be of some interest.

The loss in hide values through branding is very great, and it has been suggested that the animal be branded in the neck or shoulder, areas of the hide less valuable than the flank. Often the brand is so deeply burned as to show on the reverse side of the hide. If some method of market other than branding could be made practicable, it would result in a very marked appreciation in the value of our annual production of hides.

In bleeding, it is better to cut in a direct line with the centre of the lower lip and the point of the brisket, rather than across the throat, as the latter method renders the hide above the shoulders practically useless. The tail-bone, horns, and the top of the skull, which are often left on the hide, should be removed. After removal, the hide should be laid flat, salted and left twenty-four hours and again salted before rolling. When hides are rolled immediately after salting, heating occurs, and this causes the hair to decay resulting ultimately in destruction of the grain in the leather. Deacons, or hides from immature calves which are subject to sun drying, lose practically all their natural oil it would be profitable to treat these in the same way as the larger hides, special attention being paid to the removal of all meat, so that the hide may be preserved as well as possible.—Live Stock Commissioner.

THE FACTS ABOUT STOCKYARDS

The following facts about Canadian stockyards will be welcomed by those who do not know the special conditions which govern them:—

Four yards, those at Toronto, Montreal (2) and Winnipeg, handle approximately 90% of the live stock sold through stockyards in the Dominion.

The Toronto Union Stockyards oper-

ated by the Union Stockyards Co. Dividends are fixed at a maximum of 7%.

Montreal has two yards, one owned by the C. P. R.; the other owned by Montreal Stockyards Co. No packers are interested in ownership or management.

Winnipeg stockyard owned by the Public Markets Limited. No packers are interested in ownership or management.

There are in Ontario operating under Dominion Government veterinary inspection, fifteen packing plants owned by thirteen firms. The plants of seven of them do business outside Toronto. These are, in the country districts, naturally keen competitors of the buyers who ship to the stockyards. Of these thirteen firms, four only are interested in the ownership and management of stockyards. These four invested capital in the Union Stockyards, Toronto, at a time when few people recognized the value of stockyards as a market for farm stock, and when it was difficult to get other supprt for such an institution.

In Quebec six inspected firms operate, none interested in ownership or management of stockyards there.

In Winnipeg four inspected firms operate, none interested in stockyards there.

All stockyards are, by Act of Parliament, conducted under supervision of the Dominion Department of Agriculture. The Act provides for regulation and control by the Minister of Agriculture of:—

The by-laws of the Company;

The construction and equipment of yards;

Operation and maintenance;

The weighing of stock;

Information given on weigh scale tickets;

All charges made by Commission men and for fees and services of any kind;

Complaints of unfair charge or treatment.

MARTINDALE FARM A REVELATION TO BOARD OF HEALTH

The Guernsey Breeders of the Maritime Provinces will be interested in the following article from the columns of the May 20th issue of the St. Catharines, (Ontario) standard. Some of the cows mentioned bear names that sound like names that graced several beauties at one time owned by Howard Corning, Yarmouth, N. S. Messrs. McSloy are ranked among the foremost Guernsey enthusiasts in Canada.

The Board of Health paid a visit of inspection to Martindale farm on Wednesday afternoon. This was not one of those formal visits where the Sanitary Inspector and the M. O. H. are doing a detective stunt to look for infections of bylaws, but was more in the nature of a demonstration of modern methods of dairying.

To say that the Board was pleased with all it saw, is putting it very mildly. Sanitary Inspector Bonham was divided between hope and apprehension; hope, that eventually every dairy herd will be kept in such scrupulous cleanliness; apprehension, that if such a thing came to pass, he, like Othello, would find his occupation gone.

The Board saw 25 of the finest cattle the world produces in surroundings befitting their aristocracy; modern stables, with up-to-the-minute furnishings; the cattle groomed till their coats shone like silk, attendants in white uniforms looking after them.

Milking Time

Just as the party reached the stables milking was going on, so the Standard man nosed in and followed the process. Cleanliness and sanitary methods are the essence of the contract. The milk goes into a pail through a screen of silk; then it is restrained, and goes to the aerator, where it is cooled; then it goes to the clarifier, where any sediment that may possibly remain is removed. The The whole process was the acme of perfection so far as the production of pure milk is concerned.

The milk taken from every cow is weighed and a record kept. Miss Harvest, a magnificent Guernsey, has the Canadian record at her mercy now, though she has nearly a month to go yet to complete the year.

Just as an ordinary matter of fact, Mr. McSloy told the party that May King's May had a record of one and a half tons of milk in 58 days, and that Bijou de Frances produced 943 pounds of butter fat in one year, equivalent to 1100 pounds of butter.

The very latest addition to the herd is a 2½ weeks old calf, a daughter of "Annie Laurie," the first cow in the herd. There is a possibility that the youngster may be named "Miss Harry Lauder."

And speaking of daughters, the party naturally admired Penroyd Rose whose daughter sold for $3,700 at Chicago a week or so ago.

Jennie Robena and Raula Revere, the cattle that carried all before them at Toronto exhibition came in for a lot of attention.

Maple Glen Sun Brier has just arrived from the United States. He is expected to take a paternal interest in the herd. He is a magnificent looking fellow. His full sister has a 615-lb. butter record.

Fr the general improvement of cattle breeding throughout the district, the Messrs. McSloy have decided to sell Martindale King, a young bull of great promise. His mother is May King's May and his father Royal Blood of Bailey Falls. "We'll let him go for $300 less than half his worth, if he is sold locally," said Mr. McSloy—which looks like a wonderful opportunity for some enterprising breeder.

Every member of the Board was greatly impressed with the visit.

Messrs. H. E. and J. A. McSloy personally conducted the tour which was every moment replete with interest.

EVIL EFFECTS OF DECAYED FOOD

Decayed food should never be given to fowls. There is a temptation to do this when meat or vegetables are around the place which have become too old for the family to eat. People thoughtlessly seem to take it for granted that fowls have some way of disposing successfully of the poisons that are set loose in the decomposition of meat and other foods. So far as we know fowls are no more able to do this than any other animal.

These decayed foods will at the least upset the digestions of the fowls and when that is done the way is opened for the advent of real ailments. If given reasonable choice, fowls will not eat decayed food, but if very hungry for some such food as meat will eat it even if pretty badly spoiled.

FIRST in Canada to adopt the valve-in-head motor—first to manufacture quality cars in quantities—the makers of McLaughlin "Master Sixes" now enjoy the distinction of producing a car in keeping with Canada's national ideals of efficiency, power, beauty and economy.

The McLAUGHLIN MASTER SIX

A THREE YEARS' EXPERIMENT RESUMED IN A SHORT ARTICLE

In the course of my reading the other day, I came across the details of an experiment which are interesting enough to form the subject of a special article. There is to be found in them matter for careful thought on the part of proprietors of dairy herds. The science of feeding is peculiarly complex; agronomists learn its secrets but slowly, and it is only very gradually that we eliminate the unknown factors.

The report of the experiment to which I now have reference is taken from the annual report of the Armstrong College of Newcastle-upon-Tyne.

I give the principal facts for the information of my readers.

This report shows the results of researches into the feeding of dairy cows, carried on during a period of three years, for the purpose of ascertaining, or at least of throwing a little more light on the following points:

(a)—The effect of the quantity and quality of milk, of milking at regular intervals or otherwise.

(b)—The effect on the quantity and qualityf of milk of a small quantity of phosphates fed directly to the cows.

(c)—Results of milking three times a day in comparison with two milkings per day.

The results of these experiments may be resumed as follows: I think it would be useless to give details of the progress and methods of the experiments. From the practical point of view the results alone are important, but it may be said that every possible precaution was taken to make these resuts conclusive:

(a)—It cannot be said that the total quantity of milk is affected by the regularity or otherwise of the intervals between successive milkings, but the amount of fatty matter in the milk is certainly increased by milking at regular intervals.

Further, the connection between the time of milking and the percentage of fatty matter is constant. The results of very long experiments definitely confirm those obtained in preceding experiments.

(b)—The improvement of poor pastures by the application of phosphate fertilizers and the increased production of milk and meat resulting therefrom being well known, it was decided to try whether precipitated phosphate of bone administered directly to cows at the rate of one ounce per head daily would have any influence on the temperament and nervous system of the cow and would exercise any action on the quantity and quality of the milk. As to these last factors no appreciable results were obtained and there is nothing to prove that the nervous system was stimulated.

(c)—No increased production was obtained by milking three times a day instead of two.

The excessive derangement caused the cows produced, on the contrary, negative results.

The quality of the morning milk was equally unfavorably influenced by an aditional milking. This question is important to the producers of milk near cities and towns.

It will be seen that the conclusions vary as to the efficiacy of the number of milkings per day. Let it be understood that a contrary doctrine is not condemned, but the experiments furnish another argument against it. And it is curious to note the results of experiments which have been made for a long time on the subject.

Such is a very condensed resume of the work effected at Armstrong College.

In a few words you have the condensed report of the work of three years. It is as succint as possible.

SHEEPMEN! ARRANGE TO DIP YOUR SHEEP THIS YEAR

In the face of the high cost of feeds and the ever-increasing necessity of greater production, it becomes more imperative than ever before in the history of our sheep industry, that all handicaps such as the feeding of the external parasites be eliminated as far as possible. It is hard to understand why dipping is neglected, when one stops to think that it is next to impossible for sheep to make progress when covered with ticks and lice which annoy them continually. It is impossible to estimate the loss of feed and the depreciation in flesh when a flock is infested. One may be certain, however, that a great portion of the feed consumed by the sheep is taken up by these parasites

A flock free from ticks and lice is the best insurance towards the better production of wool. The continual rubbing against fences, racks, etc. causes a loss of wool and damaged fleeces which are docked in price. Dipping should be regularly practised at least once a year, and better twice a year. The sheep should be dipped in the spring as soon after shearing as weather permits; in the fall, before the arrival of the cold weather. This will not only free the flocks from ticks and lice, but also tends to keep them free from any skin disease. Even though no disease or parasites be present, sheep should be dipped as a means of prevention, and it stimulates the growtr of wool to some degree. Small flocks can be dipped in vats or other suitable utensils on the farm, but in the case of large flocks a regulation galvanized iron or cement tank will be found much more satisfactory.

The initial cost of a convenient dipping outfit would be the greatest drawback to the small owner who realizes the necessity of dipping at least once a year, but does not see his way clear to go to that expense for a flock of from ten to twenty-five.

Community Dipping Outfits

By the small flock owners in a district combining and having a dipping tank jointly owned, it can either be placed at a convenient centre, and all flocks from a radius of from two to four miles being driven to the centre and dipped on a certain day or each sheepman using the tank in turn at his own place. By the latter method it costs more for dipping fluid as the smaller the flock dipped, the greater the waste, but in either case the cost of dipping is greatly reduced.

Shinn-Flat Protects Property

A Circle of
SAFETY

Shinn-Flat throws a safety belt around every building on which it has been installed.

With thousands of buildings throughout Canada and the United States protected for years, it is a fact that no building has ever been damaged by lightning that was properly rodded with

Shinn-Flat

Lightning Rods

Make yourself, your family, your cattle, your crops, and your buildings safe against Lightning, by having them protected by Shinn-Flat Lightning Rods.

The cost of Shinn-Flat is very small compared to the value of the protection. It is money well spent if only for the comfort of mind it gives.

THE DISEASES OF PLANTS

(Continued from page 671)

our fruits, vegetables, trees, grains and so on. Is it not enough to make them diseased?

The diseases of plants are caused by Myxomycetes, Bacteria and Fungi. Let us speak a little more in detail about these organisms or pseudo-plants. The myxomycetes or slime molds are regarded as to the border land between plants and animals. On germination, their spores give forth a naked mass of protoplasm called a plasmodium which constitutes the vegetative structure of the slime mold. This plasmodium, in the case of parasitic or pathogenic forms, penetrates the cells of the plants at the expense of which they grow.

The slime molds are the causes of but two well known diseases: Club root of cabbage, turnips and Cruciferous plants, and the Powdery scab of potatoes. Both of them occur in this country.

The Bacteria, minute one-celled plants, are very pathogenic to man and animals. Some of them are also parasitic to plants. Fire blight to pears, bean blight, soft rot to turnips cabbages, carrots, celery and others, crown gall of apple trees and so on are caused by bacterial pathogenes.

Bacteria are very small. It would take about 300 of them placed end to end to equal in length the thickness of this paper. The mode of increase among bacteria is by division of the mother cell into two, the daughter cells, which, in turn, divide, and so on through all their life.

Bacteria invade the cells or tissues of cultivated plants and destroy them.

The fungous pathogenes constitute by far the greatest numbr of plant parasites. The majority of our plant diseases are caused by fungi. They are dependent for their nourishment upon food substances elaborated by the green plants. They absorb this food by means of a kind of root called mycelium which can be seen with a microscope through the tissues of the parasited plants. At fruiting time they give birth to a great number of spores, visible to the naked eye on the plants that have been attacked. The black dust taking the place of grains on a smutted head of oats is a mass of spores, capable the next spring of initiating the same disease —the smut.

The fungi which cause plant diseases are small. We cannot see them with the naked eye, except their spores when they are in great mass. We see only their effects: spots, scabs, rusts, which constitute the symptoms of diseases.

The Life History of Plant Pathogenes

The life history of a plant pathogene consists in the story of its activities, its different forms and structures and its relations with the hosts

Most pathogenes exhibit in their life cycles two ddistinct phases: pathogenesis and saprogenesis.

Pathogenesis is that phase of the life cycle during which the organism is associated with the living tissues of the plants. This phase embraces three well marked periods: inoculation, incubation and infection.

The period of inoculation includes the phenomena involved in the trans fer of the parasite or pathogene. Wind, rain, man, insect, etc., which transfer the inoculum (spores of fungi, bacteria), are spoken of as the agents of inoculation.

The period of incubation begins with the arrival of the inoculum—spores, mycelium, bacteria—on or in the plants. The growth of the inoculum begins almost immediately upon its arrival in the infection court. The environmental factors: moisture, temperature, are necessary. Without moisture, the spores of the fungi cannot grow. We have here the explanation of the great development of fungus diseases during moist weather.

The period of infection covers the time from the initial injury to the end of the reactions of parasite and living host. Once the germ of the spores has penetrated in to the plant it continues to grow, invading the cells, where the food is found. After a time, the parasites produce new spores which disseminate the disease through the season.

The second phase of the life cycle —saprogenesis—is the period during which the pathogene or parasite is associated only with the non-living tissues of the host plant. It is during this phase that the winter spores are produced—those that initiate the dis ease in the spring.

En resume, we may say that the diseases of plants are produced by very low plants, invisible to the naked eye, dependent for their iourishment upon food substances elaborated by the true plants. On that account, they are called parasites. They reproduce themselves by means of spores. To fight against those germs —spores and bacteria—is to fight against the diseases. Firmin Letourneau, B.S.A., Oka Agricultural Institute.

Oil That Experience Approves

IMPERIAL

Lubricants

For gasoline-burning engines— automobiles tractors, trucks.

IMPERIAL POLARINE AND IMPERIAL POLARINE HEAVY

For motors requiring an unusually heavy oil.

IMPERIAL POLARINE A

For kerosene-burning stationary engines and tractors.

IMPERIAL POLARINE KEROSENE TRACTOR OIL AND IMPERIAL POLARINE KEROSENE TRACTOR OIL, EXTRA HEAVY

For open bearings of separators, binders,etc.

IMPERIAL PRAIRIE HARVESTER OIL LIGHT

IMPERIAL PRAIRIE HARVESTER OIL HEAVY

For worn and loose bearings—a thick oil.

IMPERIAL ELDORADO CASTOR MACHINE OIL

For steam cylinder lubrication—tractors and stationary engines.

IMPERIAL CAPITOL CYLINDER OIL

For stationary and portable engines using either kerosene or gasoline.

IMPERIAL STANDARD GAS ENGINE OIL

For grease cup lubrication—a clean solidified oil.

IMPERIAL ARCTIC CUP GREASE

Made in different consistencies.

Imperial Farm Lubricants are sold in 1 and 4 gallon sealed cans, half-barrels and barrels.

WHEN you know what oil gives best results, insist on getting it. Nothing is more important to successful mechanical operation.

Different types and sizes of machines, and different service conditions govern the choice of oils and greases. Among the Imperial Farm Lubricants, you will find the best lubricant for each machine part and for every machine used on the modern farm.

Each Imperial Farm Lubricant has been developed for farm service and tested under actual working conditions. They are endorsed and recommended by leading manufacturers of automobiles and farm machinery.

Consult the Imperial Charts of Recommendations to make sure you are giving your automobile and tractor the most suitable lubrication—displayed wherever Imperial Lubricants are sold. For further information, consult the Imperial Oil Man; or write our nearest branch.

NOT ALL PRIME BEEF

Out of every dollar paid by the packer to the farmer for cattle 25 cents goes to purchase parts, which bring no return whatever to the abattoir.

Tests recently made show the yield of saleable parts and of waste material in an average steer of 1,000 pounds live weight to be as follows:

	Weight Lbs.
Dressed Carcass	540
Hide	70
Edible fat	40
Tongue	6
Liver	9
Heart	3½
Tail	1
Head Meat	5½
Sweetbreads and Weasand Meat	1
Casings	10
Tripe	10
Tankage (dry)	12
Oil and grease	6
Bones	18
Blood (dry)	9
Sinews	2

Including the manure, which weighs 75 lbs. and hardly pays for removal, the total waste amounts to 257 lbs., or just over one-quarter of the live weight of the animal.

At ten cents a pound live weight the wastage on a 1000-lb. steer is over $25.

Only by utilizing every particle of the by-products can monetary loss be avoided and only by keenest attention to these points can meat prices with increasing cost of manufacture, be kept down to the present retail level. Industrial and Development Council of Canadian Meat Packers, 186 King St. W., Toronto, Ont.

Great prices were paid for specimens of the famous breed of Gloucester Old Spot pigs when Mr. R. G. Heaton, Northaw House, England, sold his entire herd. Competition was keen, and 69 head averaged $385, the second highest average on record for any breed of pedigreed pigs. Mr. J. Putnam, Exeter, gave the top price, $1,575, for a young boar, and $1,050 for a sow.

ANIMAL DISEASES ERADICATION BOARD

At a meeting held in Toronto on Thursday, May 27th, the final steps were taken in the organization of a body to be known as the "Animal Diseases Eradication Board". As its name implies, this Board has for its object the formulation and carrying out of plans for controlling diseases of live stock in Canada, it being the intention to pay particular attention at this time to tuberculosis of live stock, a disease which contributes, to a greater extent than is generally recognized, to the spread of tuberculosis in human beings, besides causing an enormous waste of food products by reason of the necessity for condemning, as unfit for human food, carcases or portions of carcases, of tuberculosis animals.

The Board is composed of twelve members, four from the live stock associations, four from the meat packers, and four from the Federal Department of Agriculture, and the headquarters of the Board will be at Ottawa. Co-operation with Provincial Governments, Railways, Banks, Press and public health bodies will be sought.

At the Toronto meeting, an Executive Committee of three members, one from each of the interests represented, was appointed to consider and make recmmendations to the full Board with reference to the details of a plan of campaign for controlling this disease most effectively, the broad outlines of the plan having been agreed upon by the Board. These details will deal with the methods for obtaining the necessary funds for the work, the executive organization, the areas to be covered, the methods by which the work can best be carried on and the administration of any fund that may be established for the purpose.

The objects in view will involve hearty co-operation between the packers, the live stock men, the Federal and Provincial Departments of Agriculture and the solid backing of all interested in the disease from the human as well as the live stock standpoints.

The preliminary meetings have indicated that there are good reasons to believe this co-operation will be secured. The plans are necessarily tentative but a great deal of progress has already been made, and after the representatives of the groups have had an opportunity to consult the executives and membership of the various associations, it is expected that a full plan will be developed and details announced.

CONTROLLING CABBAGE AND CAULIFLOWER MAGGOT

The reduction of Cabboge and Cauliflower by the maggot in New Jersey reaches as high as 20 per cent. of the yearly crop, which amounts to practically $45,000. The tar paper disk method has been used by some growers in this State, but it was found impracticable. In the first place it required quite a bit of labor to place the paper disk around the plant, and in cultivating these disks would be covered with ground. In the second place, during the early spring there is more or less wind, and in plowing uqite a few gardeners found that by working back and forth the plant had a tendency to become bruised or cut by the disk.

The most effective control practiced in New Jersey so far is that of preventing the fly frm laying its eggs by the use f a repellant of a mixture of water-gas tar and sand. To every bushel of clean sand, one quart of thin water-gas tar is used. This may be applied in two ways. However, the best way is to dip the stirring paddle into the tar and stir into the sand. In this way every grain of sand will be coated with the tar. As soon as the early plants are planted into the field, about a teaspoonful of this mixture is dropped near each plant, and preferably towards evening. Three or four applications of this tar and sand may be necessary at intervals of three to four days. The North Jersey and Long Island gardeners have found this the best and most practical repellant for the fly on both Cabbage and Cauliflower.

CONTROLLING ONION MAGGOT

We have been exxperimenting for the past two years in the field laboratory at Girard, Erie County, Pa.,

LOUDEN

HAY CARRIERS

Quick Work. Every Minute Counts at Hay Time

HOW hard and faithfully the Louden Hay Carriers and Louden Hay Forks and Slings work at haying time! One thousand to two thousand pounds lifted from the wagon and deposited in the mow at every trip. They speed up haying and beat the threatening rain—save your crop from damage at the critical time.

No halts. No trouble. Louden Hay Carriers are strong and powerful and with an extremely simple and sure-working mechanism. They pull loads through small doors, over beams and drop them exactly where you want them.

The Louden Illustrated Catalog tells all about them and other Louden Haying Tools. Write for it, and if desired, we will also send the Louden Book of Barn Plans—all about barn planning, materials and construction.

with various methods of control for this pest and have found that the Poison-bait Treatment," as used by G. Sanders and H. H. Severin, in Wisconsin, gives the most satisfactory results.

Poison bait is made according to the following formula: sodium arsenite, one-fifth ounce; cheap molasses, one pint; water, one gallon.

The molasses acts as a bait and attracts the adult maggot flies and the sodium arsenite, which is a soluble poison, kills them. By poisoning a large number of the female flies, especially early in the season and when they are laying eggs, the per cent. of infestation of the Onion crop by maggot can be greatly decreased. Results of our experiments in Erie County showed, during last season, a gain of 16 to 17 per cent. in yield and the amount of infection was reduced 54 to 64 per cent. by systematic treatment.

The poison bait mixture should be placed in shallow tin cans at about ten row intervals over the field. A little chopped Onion added to the bait in each can will add greatly to its power of attraction. The mixture in the cans should be renewed after every heavy rain for its attraction and killing power depends largely on its freshness. It is essential to place poison bait in the field early in the season, i.e., as soon as the Onions are planted, and to continue treatment the whole growing season, for the Onion maggot is usually double or triple-brooded and will infest Onions throughout the entire growing season.—John R. Eyer.

THE PROFITABLE LITTER

The fundamental object in swine breeding is for the production of the greatest numbers of quickly growing pigs. Hog raising is purely a market proposition. We may keep a horse or a cow, even a dog, beyond its years of real usefulness for love or association's sake but with the hog our regard for him is purely mercenary. We have therefore come to regard prolificacy in the swine mother as of very great importance, so much so indeed that we do not always differentiate between numbers and profit for all experienced hog raisers know that it is easily possible for an over-zealous sow to numerically discount herself by producing a larger number of pigs than she can raise well. As a rule for the average sow it will be found that there is more ultimate profit in a litter of 10 pigs than in one of 12 and often more in 8 than in 10. The successful fruit grower thins his fruit to the ability of his tree and all growers of pigs may at least consider this as a suggestion to them.

GROWING MAMMOTH PUMPKINS

I wuld like to know what to do to grow the largest Pumpkin possible.—F. O.

I have not had any experience in growing Pumpkins of mammoth size. However, I should think you would proceed in about the following manner:

Remove the surface soil in the best garden loam that you have and dig out the subsoil for an additional depth of 8 or 10 inches. The holes thus prepared should be at least 3 feet in diameter. Additional good soil should then be placed in the hole and mixed very thoroughly with rotten manure. I should think it would be possible to mix in such soil a wheelbarrow load of well-decayed manure. I should also use a couple of quarts of poultry droppings, a quarter of a pound of acid phosphate, an ounce of nitrate of soda and a little muriate of potash, if obtainable. The entire mass should then be mixed most thoroughly and then firmed by the use of the feet. The Pumpkin seeds should be planted as early as you think it is possible to avoid frost. If you could prepare a square box, with glass over it, to place over the hills as a protection to the plants until they are well started, you would gain thereby. After the plants are well started you might secure additional growth by feeding them week after week with liquid manure.—R. L. Watts.

FOR SALE

Ten pure bred Yorkshire pigs. Price $10. unregistered. Apply to WENDELL WARD, West Bathurst, N. B.

DELAYED FERTILIZER APPLICATIONS

Lack of labor on the farm, unfavorable weather at planting time, congestion and strikes on railways and consequent delays to shipments, may prevent the full and proper amount of fertilizer being applied to the crop at time of planting.

A late application of fertilizer as a side-dressing to rowed crops, or as a top-dressing for other crops, is often quite as effective as when applied at planting or seeding time.

Certainly it is much better and wiser to make the delayed fertilizer application in this way than to attempt to grow a crop with no fertilizer at all, or with less than the usual quantity. Fertilizer conserves farm labor by making it more productive. The high problem is to apply the fertilizer with the least possible amount of labor, but at such time, and in such a way, as to make it most effective.

Milk producers supplying the City of Toronto have asked $2.60 for an 8-gallon can for their summer milk, which figures out at $3.25 per 100 pounds. In the city the dealers have increased the spread from 5½ to 6c per quart, and the consumers will get 14 pint tickets for $1.

MAXWELL

Has Won Its Following Through Its Quality

THE metals used in the Maxwell chassis compare favorably pound for pound with those in the best cars that the world has produced, according to metallurgists.

There is a real reason for this quality in a Maxwell.

The fundamental purpose of the Maxwell is to carry the same passenger load over the same roads and at the same speeds as larger and more expensive cars.

But it must perform this mission *in an extremely economical way.*

Therefore the Maxwell has to be light. But to make it strong as well as light only the very best of materials can be employed.

Hence, the quality metals.

And it is through the quality of its metals that Maxwell has developed its following.

This is a following that began five years ago with a foundation of 5,000 and now reaches a mark of 100,000 new Maxwell enthusiasts in 1920.

300,000 Maxwells now on the highways of two continents are a daily endorsement of the merit of this great car.

MAXWELL MOTOR CO., of Canada, Limited, Windsor, Ont.

Percherons & Belgians

30 Head

Stallions & Mares

FOR SALE

Come to Grenville and buy the kind with the big, round feet, clean, hardy, dry bone and joints, sloping pasterns and straight, flashy action. Buy the kind with the sloping shoulders, short back and long, level croup. Buy the modern Percheron or Belgian.

Our prices are very reasonable, and we will give up to three years time, to responsible parties.

All stallions government inspected.

THREE HUNDRED KEGS first quality wire nails, mixed sizes, suitable for repair work around farm buildings and other premises. Price $4.00 per 100 lbs. Apply by mail to "NAILS," care of Office Maritime Farmer, Sussex, N. B.

THE WOOL SITUATION

Speculation is rife these days as to the future of wool prices, everything pointing to lower values on all grades both East and West. It could hardly be expected that the high prices obtained during the past three or four years would continue indefinitely and the general opinion in the wool trade is that the break is at hand. Dealers are moving cautiously and in many cases buyers are being called in or advised to buy sparingly or at prices low enough to play safe. In short the trade as a whole is very dull and listless, there is absolutely nothing doing as compared with the activity shown other years at this season and those in closest touch with the situation are at a loss to know which way the wind bloweth.

Various reasons are advanced for this state of affairs chief amony which is the stock of last year's clip still on hand and the apparent impossibility of realizing on it for the moment. Another very potent factor is noted in the fact that all over the country Canada, United States, and Great Britain alike, there is a stringency and tightening of money. Loans are hard to get and then only at the very highest rate of interest. Conditions being so uncertain, men aer loathe to take a chance on future changes. This is, of course, simply one of the financial stringencies occuring from time to time and it will straighten out in the very near future as it has done in the past. Wool is undoubtedly needed and all grades will be in strong demand in the course of a few months.

In view of this financial condition this is, of all seasons, the time that the grower should consign his wool through the local Sheep Breeders' Association so that it can be held until such time as the market takes on a healthier tone. Consignment in this way simply means that the wool is graded by expert graders supplied by the Live Stock Branch, Ottawa, and is eventually sold co-operatively through the grower's selling agency, namely the Canadian Co-operative Wool Growers Limited.

This naturally brings up the question of comparing wool sold on a "graded" basis with that sold on a flat basis. When it is properly graded and sold by grade, each grower realizes full value not only on his flock but on his effort to work improvment and establish proper business methods in connection with his sheep enterprise. The marketing of all produce from the farm is rapidly reaching that place where it will be graded and sold accordingly and the man who pays attention to "grade" will undoubtedly reap the benefit.

The coarse wool man may argue that for the past two years he could realize more on his wool sold on the flat basis. This is perhaps true owing to the demand that has existed since the conclusion of the war for the finer grades. It is noteworthy, though, in this connection that back in 1916 and 1917, the demand for various grades was just the reverse. These were War years and fabrics made from the coarser wools were in stronger demand. Public opinion is likely to take a turn in that direction again at any time, in fact, right now there is an increasing tendency on the part of the people not to buy high priced goods made from the finer wools. In other words there is little room for a "grouch." In order to realize the full value of co-operation one must first recognize the underlying principle, that of sticking together and making trade lively by keeping up the competition. After all, it is not the result obtained by a co-operative enterprise during one years business but the sum total of results spread over a series of years that counts for most.

Waste nothing, not even the paper bags, wrapping paper and twine coming to the home from the store. They come handy in many ways. Start a ball of wrapping twine with the next purchase and you will always know where to go for string.

"YOU SEE IT'S A MARITIME FENCE"

Maritime fences will stand the severest tests, because they are built throughout of extra heavy hard drawn No. 9 steel wire. The superior stretching power of No. 9 wire keeps the strands from snapping under heavy strains or hard frosts. Each fence is thoroughly galvanised and will sturdily resist the rust and rot of weather.

STANDS THE TEST OF MAN, BEAST, WEATHER and TIME

The strands and stays are firmly gripped at every join by our special time tried and tested never-slip lock. Even after years of hard service, Maritime wire fence retains its sagless shape and sightly appearance. All Maritime Fences are carefully inspected and rigidly tested before leaving the factory. When you buy it you know you have got something that is bull strong and hog tight, something that will withstand greater strain than it is ever likely to receive.

Before you buy fencing it will pay you to first learn what the Maritime has to offer in the way of real fence service.

For sale by agents and dealers in nearly every section.
If you don't know the local dealer, write to us direct.

PURINA

There's a Purina Feed for Every Need

Does this interest the Farmer

It surely must—in a study of feeds it is essential that the feeder have a full understanding as to the palatability, bulk, laxativeness, succulence, etc., of feeds in general. The man who understands feeding and practices it daily, is more sure of success than the one who does not. In the manufacture of PURINA FEED, scientific research has given us the knowledge whereby it has been possible to produce properly balanced rations which, when fed according to the PURINA plan, makes for the greatest success.

Every ingredient that goes into PURINA FEEDS is scientifically compounded and absolutely adjusted to the digestive organs—because they are uniformly mixed, which is seldom if ever true of home made rations.

Are Your Sows Prepared to Raise Thrifty Pigs

Do you know whether your sows are properly nourished before and after the pigs are born? Are they getting the right elements in correct proportion for best results? Unless the diet is properly balanced, the sow's milk flow will be cut down, particularly in the rear udders. You need not have runts. A properly balanced ration will prevent them.

PURINA PIG CHOW

regulates the sow's system, and puts her in the best of trim for big production. It puts rich, red blood in her veins, the basis of an abundance of rich milk, sufficient for all the litter. It starts the pigs off right to make market-toppers.

PURINA O-MOLENE

A vigorous horse doing hard work, requires good digestion of all that he eats. PURINA O-MOLENE FEED is the perfectly balanced ration—the ingredients used in its manufacture being cracked corn, oats, Alfalfa, Molasses and one per cent Salt. PURINA O-MOLENE FEED is more easily assimilated by the horse and contains all the nutrients required. It produces better results than Oats, Corn and Oats or other mixed feeds. Much waste is occasioned through horses swallowing whole Oats to an extent of 15 to 18 per cent lessening of their digestive and consequent nutritious value. There is little or no waste when feeding PURINA O-MOLENE.

Purina Feeds are Sold in Checkered Bags Only

You can yield larger profits by using PURINA FEEDS. Thousands of successful feeders bless the day they started buying Checkerboard bags and following the "Purina" plan —and so will you. Don't put off. If your dealer cannot supply you with PURINA FEEDS, write directly to the Chisholm Milling Co., Toronto, and your wants will be promptly supplied.

Purina Poultry Feeds

No investment will bring larger profits than PURINA CHICKEN CHOWDER—it makes hens lay—it makes them pay. We are so sure about it, that we give a guarantee of "more eggs or money back" when fed the PURINA way. PURINA BABY CHICK FEED guarantee reads—"Double development or money back" if chicks do not develop twice as fast as when fed a grain ration. Always insist on getting the checkerboard bag.

Write us today for free copy Dairyman's Home Reading Course

PURINA COW CHOW

PURINA COW CHOW is the outstanding dairy feed. Not only is the quality of the grain guarded, but the ingredients are accurately measured and mixed by machinery. It is balanced to produce extra milk in the milk pail. At the present milk prices, this extra milk means big extra profits. PURINA COW CHOW FEED which is a bulky ration containing 24 pounds of protein in every 100 pounds of feed. Every ingredient—linseed meal (old process), gluten feed from corn, hominy feed, cottonseed meal, ground alfalfa, molasses and 1 per cent. salt—is of recognized value.

Don't Kill the Calf

With the present profits on beef you cannot afford to butcher the calf, and with the high price of milk you cannot afford to raise the calf on milk. But you can raise the calf on PURINA CALF CHOW, the perfect milk substitute. Every ingredient is quickly and easily assimilated without scouring or burdening the delicate digestive organs of the calf.

THE CHISHOLM MILLING COMPANY LIMITED, TORONTO

Look for the Ru-ber-oid Trade Mark

You cannot afford to buy ready-roofing in a hap-hazzard manner. The questions of service and cost are too important. Your decision as to the grade which will best meet your requirements should be based on definite information.

Innumerable people ask for Ru-ber-oid, believing that the name stands for what they want in ready-roofing. In the course of a year, thousands of them do not get Ru-ber-oid *although they think they do.*

These people fail to get what they ask for because they do not know that the name Ru-ber-oid can be rightly applied to but *one* ready-roofing—that made by The Standard Paint Company, bearing the Ru-ber-oid Man on the out-side of the roll.

Ru-ber-oid is the peer of any roofing made. It has a proud record of service, covering more than a quarter of a century. On many a roof the limit of its endurance has not yet been found after more than twenty years of duty. Inborn quality, from the surface to the center, is what gives Ru-ber-oid its character.

Ru-ber-oid is expensive—judging by the cost of many ready-roofings. Its quality justifies its cost. It is made for the man who wants the best in ready roofing, who realizes that low price and high quality do not team together. If you are that kind of a man ask for Ru-ber-oid and *look for the Ru-ber-oid Man*, our trade mark.

Scales That Save Money

WOULD you willingly hand over part of your fair profit to a man with whom you were doing business? Decidedly not. And yet thousands of farmers who do not own good, reliable scales are doing that every day of the year.

Recently we wrote to a number of men who own our famous

Renfrew TRUCK SCALE

We asked them to give us their candid opinion of its value. You will see by reading through the column at the right what just a few of them think. Note particularly what they say about its value as a money saver.

It is an ideal investment for the progressive Canadian farmer. It is a light, yet strong and powerfully built scale that will *weigh anything from a pound in weight to over a ton.* It is absolutely accurate. It can be wheeled around like a truck, saves a lot of heavy lifting, and takes up very little room when not in use. It is self-adjusting; that means that it will weigh accurately on uneven ground. The wheels are wide, thus making it possible to run the scale over soft or muddy ground.

Each Renfrew Handy Two-wheel Truck Scale is numbered, and before being shipped is thoroughly tested for accuracy and strength by a Government inspector. It is a Made-in-Canada product throughout. It has many other splendid features that are bound to interest you. Write to-day for our booklet.

The Renfrew Machinery Co., Limited

Head Office and Works: Renfrew, Ont.

Branches: Montreal, Que.; Sussex, N.B.; Milwaukee, Wis., U.S.A.

Other Lines: Renfrew Cream Separator, Renfrew Oil Engine, and Happy Farmer Tractor

What a few Renfrew Truck Scale Users Say:

Mr. D. B. Haskett, R. R. No. 5, London, Ont., writes that "on more occasions than I can keep track of," the Renfrew Truck Scale has saved him money. It will weigh anything "from a cow to a chicken".

In a deal in hay, Mr. Rufus Botting, Godfrey, Ont., reports that his Renfrew Truck Scale saved $25.00, in a grain deal $10.00, and in another in pigs, it saved $15.00. Altogether in the three deals he mentions, it saved him $50.00. In the 5½ years he has used it, his scale has proved entirely satisfactory.

Mr. T. Hust, R. R. No. 3, Pembroke, Ont., thinks a farmer should not be without one. His scale, on which he weighs all his farm produce, has saved him many market fees.

Mr. W. B. Scobie, R. R. No. 3, Prescott, Ont., has weighed the capacity on his Renfrew Scale, and further says he finds it very handy around his farm. He weighs "everything" on it, pigs, milk, sheep, cattle, etc., and recently saved $4.50 on a pork deal.

Mr. Wilfrid Quenneville, Desaulniers, District of Nipissing, Ont., reports that his Renfrew Truck Scale saves him money every time he is selling anything. The self-adjusting feature has been of value to him when weighing hay.

"The first fall I had them they saved me the price of the scales in wheat alone", writes Mr. Fred Laderoute, Westmeath, Ont. He thinks every farmer should have a Renfrew Scale, because "then the owner knows what he gets when he buys, and he doesn't lose anything when he sells". They give standard weight, and they are easy to move around.

On one shipment of hogs, John H. Johnson, R. R. No. 2, Croton, Ont., saved $10.00 and shortly afterwards, also thanks to his Renfrew Scale, he saved $15.00 on a cattle deal. He also believes every farmer should own a Renfrew Truck Scale.

"They are the handiest scale on the market", writes Mr. Alex. Backus, R. R. No. 1, Simcoe, Ont., who saved 3 bushels of wheat in one load, and 80 pounds on one lot of hogs, thanks to his Renfrew Scale.

Alfred Keller, Monk Road, Ont., reports that his Renfrew Scale has saved him money "in many ways too numerous to mention".

In weighing for market and in selling calves, Mrs. A. Parkinson, R. R. No. 8, London, Ont., tells us her Renfrew has saved her money. It weighs correctly, is easy to operate, and takes up very little room.

Mr. Kirby Newstead, R. R. No. 3, Atwood, Ont., weighed 2,500 pounds on his Renfrew Scale. He finds it absolutely satisfactory and says it has saved money for him many times.

"I think my scales more than paid for themselves in a very few days weighing out hay", writes Mr. Wm. J. Hough, R. R. No. 2, Prescott, Ont.

In selling grain, hogs, beef, hay, and poultry, Mr. W. H. Headley, McLennan, Ont., has saved money because of his Renfrew Scale.

Mr. Hugh Fitzgerald, R. R. No. 2, Jasper, Ont., has owned his Renfrew for ten years and in that time it has always given perfect satisfaction. "It has saved money every time it was used", reports Mr. Fitzgerald. "It saves time, takes up no room, and will last a life time".

THE MARITIME FARMER

AND

CO-OPERATIVE DAIRYMAN

REGISTESED TRADE MARK

Profiteering From the Already Overworked Farmer

Huge Reserves Have Been Piled Up by the Grain Growers Limited---New Brunswick United Farmers Stores Organized to Reduce Prices, Now Want the Earth.

The writer well recalls that when the United Farmer store movement was started in this province, perfervid orators raged and stormed about the overcharges which country stores were making to farmers. The average shop-keeper was denounced as a profiteer, a robber, a leach, a parasite(the last term was very popular and oft repeated) and a general outcast. These orators were provided with verbal ammunition (and it was always the same song) from which the audiences were informed just how many farmers and other people it required to maintain a store and thus support an army of these undesirable gentry.

The speakers went far beyond that and they told of the approach of the millennium, when United Farmer stores would dot the countryside and high prices would be no more. The stores were started in due time at various points, but the high prices are still with the farmer, and not only that, but farmers are now being urged not only to pay the prices charged by the "parasites" but to go one better, and pay still higher prices, which the United Farmer stores find it necessary to charge. So that the froth of which some of those worthy orators delivered themselves has already vanished into thin air and farmers are finding that "business is business" and that when losses come, they must share them as well as profits.

The Maritime Farmer has been taking a "real" interest in co-operation for some years. Close investigation of conditions showed that in some sections farmers were charged enormous profits on feeds, fertilizeris, seeds and other articles. In order to relieve this condition, co-operative organizations were formed in this province, notably the New Brunswick Agricultural Society United, with a view to supplying unmixed chemicals to agricultural societies. The experiment resulted in the saving of thousands of dollars to farmers.

Later the Maritime Farmer, at the request of farm organizations, bought feed and seed for them. Thousands of farmers benefited from this inovation and not only were prices reduced directly, but the effect in many sections was such that profits on feeds and seeds came tumbling down and in some instances, those who had been buying co-operatively were able to make arrangements with storekeepers for the handling of feed, which were highly advantageous to the buyers. It was good business and the farmer, by paying cash, and without investing a single cent of his capital was able to save a tidy sum each year.

It was a hard proposition to get supplies at first. For several years the Maritime Farmer had a hard, uphill fight to get the right to buy for farm organizations. However, that condition was overcome, and thanks to this paper's efforts, agricultural societies can today buy numbers of articles that were formerly not available to them. That service has cost the farmers of these provinces not one, single red cent. They were not asked to contribute money to a dozen and one different services We did the work for the benefit of our subscribers. Later a number of societies bought for themselves direct. The Maritime Farmer, when this transpired, did not abuse anybody. It encouraged them to carry on. At Petitcodiac, following a meeting addressed by a Maritime Farmer representative several years ago, a buying organization was started, and hundreds of dollrs were saved to the farmers of that section. Havelock and Corn Hill were also induced to take up the work, and they did so to advantage.

The idea of the Maritime Farmer was to stop excessive profiteering and permit farmers to get full benefit for their money. The business was practically all done by the farmers themselves. They paid their drafts, sold the goods under any arrangements they saw fit, but they did save money. All this had a very restraining effect in some sections. It proved that profiteering could be met and could be controlled. The Maritime Farmer, therefore, did much to put an end to what was in some sections, undesirable, to say the least. But the Maritime Farmer sees no difference in profiteering, whether it be carried on by a merchant or a number of farmers who have put their money into a business, the principal object of which is to make money, not to save it as was first announced. The Maritime Farmer only sees this difference that if it is wrong for a man who makes no pretense of virtue to soak customers, then it is worse for those who profess to be friends of those customers, to not only charge them the prices which were previously condemned as unjust, but to go one better and try to justify still further profiteering.

In its issue of June 2nd, the United Farmers' Guide is back to the task of trying to induce farmers to pay more for flour than they can buy it for elsewhere. The Guide complains that shop-keepers are selling flour at $14.75, while the United Farmers are buying the same grade at $15.79 per barrel. This, in the judgment of the Guide is not right. The store keeper, who offers flour one dollar and four cents per barrel cheaper than the United Farmers' store can buy it, is a conspirator. Formerly he was a "parasite." Now he has advanced one stage and is a person who practices the "meanest" trick of selling something below the price charged by the United Framer stores. Of course, at Sussex long after the price of flour had gone up, merchants sold any grade of hard wheat flour at fifteeen dollars per barrel. The price of western flour varies today from $14.75, quoted by the Guide, to the price the United Farmers are asking. The Maritime Farmer, by long distance, got quotations varying from $15.50. At the points at which these figures were gathered, there are no United Farmer stores. The Guide believes, however, that these merchants should advance the price of flour forthwith and ask the farmer to pay not $14.75, $15.00, $15.50 or $15.75 per barrel as the case may be, but $15.79 per barrel, plus any profit that the United Farmers may ask.

Last week farmers in Charlotte county bought and delivered flour for themselves at $15.80 per barrel. They paid $56.90 per ton for bran, $63.90 for shorts and $1.42 for oats. These prices are just what the the head office of the United Farmers at Woodstock would have to pay. Yet they are opposed to the Charlotte county farmers getting the same benefits on the market that they, the United Farmers' stores get. The proper thing for the Charlotte county farmers to do is to pay Woodstock a middleman's profit and then everything would be lovely.

The Maritime Farmer observed a paragraph or two back, that it not only dislikes profiteering, but it dislikes it most in these self-professed friends of the farmer. Shareholders in the United Farmers tell us they pay more for some lines at these stores than they do from privately owned concerns. Why is this? One of the big advantages claimed by the United Farmer stores is that they can buy so much cheaper, being so much heavier buyers, than the ordinary shopkeeper. If that is so, then why are they not able to meet competition? The reason why merchants undersell them in flour is that these same merchants bought when the market was right, and they are selling at a profit based on the old price. They were keen enough to see an approaching raise in the market and took advantage of it, although it required no master-mind to forsee this condition. It was impossible for grain growers to get raises in their wheat prices and not have flour and feed go up. Why, if Winnipeg was as sincerely interested in the farmers of the east as it professes to be, why was Woodstock not notified and advised to get in on the ground floor? So it would seem that the claimed advantage of being able to buy in large quantities is lost. so far as the United Farmers of Woodstock are concerned, in relation at least to their flour buying.

The Maritime Farmer has had the courage to point out a few of the shortcomings of these so-called co-operative companies and it is proposed to continue to do so. Take, for instance, the Grain Growers of Winnipeg. That concern, according to one of its principal officers, had assets two years ago, of $6,000,000. Its paid up capital is $2,500,000. That is to say, it has a surplus of three million five hundred thousand dollars, which it must have taken from the farmers of the west. And this despite the fact that the farmers of the west through the catalogue of the United Grain Growers are assured that increased business means greater benefits for the buyer. Not only has this great surplus been piled up, but in one year it is admitted that the Grain Growers' Association made a profit of $500,000 on a capital of $100,000. In explaining this Hon. T. A. Crerar contends that this was the ordinary profit earned by other concerns. Exactly. But firms making far less profits have been condemned in the most brutal way by the Grain Growers' Guide, for profiteering.

Apparently the Maritime Farmer and the United Farmers' Guide are very far apart in their ideas of what co-operation is. We believe that co-operation in its true sense does not admit of the Grain Growers piling up surpluses of three and a half million dollars, or of making profits of five hundred per cent. We do not care what others may be doing. That only makes the offence greater. We repeat that if it is wrong for non-farmers to rob farmers, then it is infinitely worse for farmers to rob their brother farmers. We have no patience with the defence that two wongs make a right.

The Maritime Farmer has never hesitated to criticise overcharging. It is doing that very thing now. It does not see any reason why a farmer should pay the United Farmers stores five dollars per ton more for feed than they can buy it elsewhere for. It sees no connection between the politics of any man in this country, and a duty on his part to pay well on to two dollars per barrel more for ffour than he has any need of doing. There are shareholders in the United Farmer stores, who profess to think that they have not derived all the benefits that they were promised, when they were induced to become subscribers. At least they were surely not led to believe that an investment that they must pay whatever Woodstock thinks is right.

Some reference was made in the Guide to a movement in Petitcodiac

(Continued on page 726)

Improving the New Brunswick Egg

By G. B. Wilson, Dominion Poultry Rep. for N. B.

Canada produces annually about one hundred and sixty-five million dozen of eggs. She exported during 1919, less than six million dozens. New Brunswick's hen population for 1919 was about 791,000 birds. Allowing an average egg producton of seven dozen per hen, we have an annual provncial production of 553,700 dozens of eggs. Add to that the value of our poultry meats and we have an industry of no mean proportions either considered individually or by comparison with our other agricultural productions. About 90 per cent. of our farmers raise poultry; hence eggs may be said to be a universal food; as well as a food of high nutritive value. Our output of eggs is steadily growing, but the demand is growing even faster than the supply. This demand is due to increased cost of meats, a preference for eggs as food and to a realization of the palatability and tre digestibility of one of the most nutritious foods on the market today.

Unfortunately many of the eggs produced do not reach the consumer as fit for food and many more that are fit for food are food of a much lower standard than nature meant them to be. We must remember that the hen presents her owner with an egg that is fresh, sweet and nutritious. It may be small, or dirty or thin shelled, which faults are at the door of her owner who disregards breed, feed and clean and sufficiently large laying quarters. The hen keeps pace with her breed and environment and almost invariably, even under the worst conditions gives her owner more than she receives. What becomes of the fruit of her clucking and endless scratching and unwearied searching for an egg-producing life? She goes singing to her nest and lays a perfect egg; but how many of her lay reach the consumer fresh and sound, and what part does marketing play in the sum total of the quality of her product.

The big problem in marketing is to get produce from the producer to the consumer and ocnserve that quality and flavor which is nature's contribution, guarantee the consumer that he gets what he buys and give the producer the remuneration that he right ly deserves.

Our Canadian egg regulations recognize four main grades of fresh eggs defined as follows:

Class 1.—Fresh. Eggs which have not been held under refrigeration at a temperature of 40° Fahrenheit or less except when in transit or subject to artificial preservation.

Grade (a)—Specials. Eggs of uniform size, weighing 25 ozs. to the dozen and over, or 47 lbs. net to the 30 dozen case; clean and free from stain, strong and sound in shell; air cell small, not over 3/16 of an inch in depth; white of egg to be firm and clear and yolk dimly visible. Maximum allowance at time of inspection ot to exceed 12 eggs per case undergrades below the grade stated.

Grade (b)—Extras. Eggs of good size, weighng at leaist 24 ozs. to the dozen, or 45 lbs. net to the 30-dozen case; clean; sound in shell; air cell less than 3/8 inch in depth; white of egg to be firm and yolk slightly visible; maximum allowance at time of inspection not to exceed 12 eggs per case undergrades below the grade stated.

Sub-Grade (1)—Pullet Extras. Eggs which have the quality of extras, but fall short in weight shall be known as pullet extras, providing they weigh at least 20 ozs. to the dozen, or 37½ lbs. net to the 30-dozen case; maximum allowance at time of inspection not to erceed 12 eggs per case undergrades below the grade stated.

Grade (c)—No. 1's or Firsts.—Eggs weighing at least 23 ozs. to the dozen, or 43 lbs, net to the 30-dozen case; reasonably clean; sound in shell; air cell elss than ½ inch in depth; white of distinctly visible but mabile; egg to be firm; yolk may be air cell stationary; maximum allowance at time of inspection not to exceed 12 eggs per case undergrades below the grade stated.

Grade (d), No. 2's or Seconds.—Eggs sound in shell; may contain weak watery eggs and eggs with heavy yolks, and all other eggs sound in shell and fit for food; maximum allowance at time of inspection not to exceed 12 eggs per case undergrades below grade stated.

Aside from these grades of marketable eggs we find eggs with blood rings, spot rings, black rots, mouldy eggs and blood spots which are unfit for food.

Effect of Dampness and Heat on Quality

Having now some idea of the grades of eggs on the markets, let us see what causes contribute to produce them. It has been said that climatic conditions have the greatest influence on the quality of the eggs coming to the markets. Too much rain means that the hens have muddy feet, hence the eggs may be soiled even when deposited in clean nests; but when laid hither and yon, in stolen or unkept nests, as so many farmers permit their birds to lay, the proportion of dirty eggs is greatly increased. Dampness, too, in duces a more rapid growth of the bacteria or fungi which are commonly present even in new-laid eggs, but which are in such small numbers that they can be disregarded unless conditions favorable to their multiplication arise.

Heat, however, is the most prolific source of trouble. Hot weather not only puts the hen out of condition, but it hastens all the evils that an egg is heir to after it is laid. Its flavor is lost sooner; evaporation is hastened, hence the shrunken egg comes more quickly; worst of all, the development of the embyro in the fertilized egg proceeds with a greater and greater steadiness and rapidity as the temperature rises, resulting in the "rots" and "spots" of commerce. It is the medium temperature of March, April and part of May that is responsible for the high proportion of fresh eggs on the spring markets, as well as the fact that, because the price is apt to fall, the producer ships his eggs quickly.

Germination

In order to preserve the desirable qualities which are found in the new-laid egg until it reaches the consumer the development of the chick must be reduced to a minimum. Germination of the fertile egg begins before it leaves the body of the hen and growth of the chick will continue if the temperature is greater than 70° F., though, of course, the rate of development is slowed if the temperature is below 103° F.

These facts are to be remembered when eggs are left in the sun or held in hot freight cars or stacked in hot rooms. The egg must be kept cool at every stage of its handling if it is to retain a maximum of freshness when it reaches the consumer. No amount of refrigeration or care will undo the damage done by a few hours of summer sun or a few days in a hot room. After deterioration has begun refrigeration is unable to completely check these processes.

Who Is Responsible

Usually the farmer gathers his eggs daily, or he may gather them at irregular intervals. Stolen nests often accumulate a large lay, over a period of some weeks, and may have been covered by brooding hens for a while, before the farmer happens to find them; but the chances are that vry sound-shelled eggs geos to market, regardless of the condition inside the shell. If the eggs are gathered with fair regularity, how are they kept while on the farm? Generally where the housewife can most conveniently get them for household use, not where the temperature is low and the air fresh. Neither does the farmer have any regular time for taking this stock of eggs to market. In the spring, when they are most plentiful and the market is falling, he is apt to go weekly or the egg peddler calls at the farm. When hot weather comes and the lay falls off he waits for a larger number or is too busy with "crops" to drive to town. Meanwhile shrinking and incubation are goin on rapidly, and, as a last insult to the hen which laid a perfectly fresh egg and the consumer who wants a perfectly fresh egg, he often goes to market with an umbrella over himself, but the basket of eggs is exposed to the summer sun, a heat which is often 80° F. and may be 10 degrees or more above that. In the autumn, with a still smaller lay and a rising market, he hold eggs for high winter prices. The conditions under which he keeps them are not conducive to good preservation, and the time is inordinately long.

The Country Merchant

The country merchant handles eggs as a by-product, taking them in exchange for merchandise. He makes his profits on the merchandise taken in trade, and sometimes on the eggs, frequently giving an inflated price for them to hold the trade of the desired customer. He, too, is more apt to be careless than careful of them while they are in his possesion, storing them in hot and damp quarters and holding for high prices when production is low.

The country merchant and peddler buy eggs "case count" rather than "loss off." Buying "case count" means that a uniform price is paid per dozen, irrespective of the suality of the eggs. Rots bring just as much as good eggs. Buying "loss off" means that the eggs are candled before payment is made and rotten and broken eggs are returned to the farmer.

The country merchant is usually not equipped with a cool dry room and a candling appliance so that he can handle eggs and pay according to grade or at least loss off. He simply packs the eggs in cases and ships to either a large city retail store or to a jobber. If to a retail stsre, the eggs are agains disposed of to the consuming public "case count.." If they are sent to a jobber, he sometimes sells "case count" but usually the eggs are candled and the bad eggs removed. The journey to the city store or to the jobber is sometimes by express and sometimes by freight. The temperature of cars is regulated by the atmosphere and is usually not conducive to improving the quality. At the express offices and freight sheds, the eggs are often exposed to the sun rays which again has its detrimental effects.

What About Price

Through all this journey many causes have contributed to lowering the quality of the eggs. But the consumer pays the bill. If the jobber removes the bad eggs, his selling price on the good eggs must make up for his loss in paying for unmarketable eggs. It costs the same money to collect, pack ship, grade and market a stale, dirty or otherwise low quality egg as it costs to perform a like service for a high grade egg, though the farmer must sell for a lower price. Deducting, therefore, the price of bad eggs and the decrease in price on low quality eggs, we have the much higher price that the consumer pays over and above the price the producer got for the same eggs.

The Remedy

To improve our New Brunswick eggs then considerable house cleaning in our present marketing system is necessary. That house cleaning must start back with the producer of eggs and continue until the egg is put into the consumer's hands. First the farmer should pay more attention to selection in his poultry that eggs may be larger, cleaner and more plentiful on the farm. The male bird should be removed from the flock as soon as the breeding season is over. The male bird is not necessary for the production of eggs. Hens will lay as many eggs if the male bird is not present. When males are present the eggs are fertile and therefore ready to devlop into chicks whn temperatures are favorable. Infertile eggs will grow stale and shrunken if held too long, or kept under bad conditions, but they do not form heavy yolks, blood rings or the great number of rots that come from the developing embryos and which cannot for such a large share of the total losses. The hens environment must be clean and sanitary and the eggs gathered frequently. Once gathered the eggs should be kept in a cool dry place. Eggs should never be washed because washing removes the protective coat, permits bacterial contamination and consequent "spot rots." Eggs should be marketed twice a week in warm weather, so as to get them to the consumer as soon as possible after they are laid.

But 'tis no use to ask for improved methods of handling on the part of the farmer if he is not paid for the quality he produces. The great trouble in our marketing system is lack of quality payment. Some system must be built up whereby the farmer can be given payment for the grade of eggs he produces and the consumer get the grade of eggs he pays for. Once quality payment is accomplsh-ed, the produced will look to the improvement of the quality of the output.

The solution of the situation is co-operative marketing. A candling station is needed, where the eggs can be shipped direct from the farm and be candled and graded. Each individual should have a report by the candler of the eggs he is selling, with a statement of why the eggs are low grade if it be such that they are. The candling statnon should be the egg exchange—the clearing house—from where the eggs could be distributed to the consuming public by grade and the consumer have some guarantee that he gets twelve quality eggs in a dozen and not be paying for the guess workw of the dealer, as he is at present.

New Brunswick is not self-supporting in her egg trade. Our marketing system is one factor that is responsible. If the producer has payment for quality more eggs will be produced and we will have stability of market with increased consumption of eggs. There should be no secrets in the egg business.

RAT EXTERMINATION URGENTLY NECESSARY

Various Methods of Killing Recommended are Very Effective in Conjunction when Concerted Campaign is Launched

The rat is a great nuisance, but not a necessary oue. He can be got rid of by concerted action and can be fought and kept within limits even by individual action. If means for the control of the pest are not taken, the rat's fecundity, combined with an increase of his food supply and hiding places as population becomes denser, will most certainly result in his becoming nothing less than a national menace. Indeed, he is that already and rats do an incalculable amount of damage wherever food is producer, stored or transported.

The various means at man's disposal for combatting this cunning and prolific rodent are:

.—The encouragemeut of the rat's natural enemies:

(1) Domestic animals, e. g., cats, terriers and ferrets.

(2) Wild animals, e. g., owls, hawks, snakes, weasels, etc.

As to cats, the ordinary pampered house pet is useless as a rat catcher, while a semi-wild cat is liable to be dangerous to game, poultry and small insectivorous birds. Nevertheless, the fact that the cat has been associated with man since the days of ancient Egypt shows that, on the whole, it has been found more beneficial than harmful. Terriers are commonly used by professional rat catchers and can be trained to be exceedingly expert. Female ferrets are used—the males being too large—to enter the holes of rats and either drive them forth or destroy them there.

It is strange that, though man harbours the cat, he should generally show such an antipathy to small wild carnivora. Few creatures are more beneficial to man than the owl. He preys principally on rats, mice, gophers, squirrels and other noxious rodents. The damage he does to poultry is negligible. Even the hawk, though he does take a chicken occasionally, does infinitely more good than harm. Only the Sharp-skinned and Cooper's hawks and the Goshawk are exceptions to this rule. The weasel and his congeners may indeed wreak sad havoc in a poultry-house, yet, if proper precautions are taken, they can be excluded and their bloodthirsty inclinations turned vermin. As to snakes, the common species found in Canada are al non-poisonous. They certainly destroy many field mice and, if given a chance, there is no reason why they should not be valuable allies against rats.

B.—Traps.

Rats are exceedingly cunning creatures and no trap has yet been devised which has been more than temporarily successful in any one locality. No doubt many rats can be caught with them by a skilful man, but, as a means of extermination, they are not to be seriously depended on.

C.—Poisons, e. g., arsenic, strychnine, squills, etc.

Mr. E. G. Boulenger, Curator of Reptiles, oological aGrdens, London, states that, to kill rats, he has obtained the most satisfactory results with squill poison, which, in small quantities necessary for rat desstruction, is harmless to domestic animals. It is best used by soaking bread in a solution of the poison mixed with milk. Barium carbonate, of which 1½ to 2 grains kill a rat, though 10 to 15 grains are harmless to a chicken and 100 grains to a dog, is next best. It should be mixed with tallow and smeared on bread as it makes the rats thirsty. It can be used effectively with squills. After it has been put down, bowls with squills and milk should be placed where the rat will go to drink.

Strychnine is too dangerous for general use. Phosphorous and arsenic are also very dangerous, and are less successful than squills and barium carbonate.

Since the war, the suggestion has been made that poison gas should be employed against rats. No doubt this would prove very effective in confined spaces such as cellars and the holds of ships.

D.—Bacterial cultures.

In Denmark, where a vigorous, national campaign has been wager against rats, a virus discovered by Dr. Neumann, of Aalborg,, has been found very effacious. Cultures of Nemann's bacillus are put up in tins under the name of "ratin." It is simple to use and has been found to be an attractive bait. Its harmlessness to domestic animals has been demonstrated. Among rats, however, except in isolated instances, it produces a virulent epidemic, with a very high mortality. Experiment with this culture in Scotland, Germany and India are also reported to have been satisfctry.—Cnservation.

Guide Should Tell the Truth

It Doesn't Pay to Misrepresent Things, Because the Farmers of the Maritime Provinces are Intelligent--They Read Once in a While and Cannot be Fooled All the Time

We publish in full an article from the columns of the United Farmers' Guide of the 2nd June issue. We ask our readers to read it carefully and then read a despatch from Winnipeg of the same date. Then let each reader form his or her own opinion as to the reliability of the Moncton edition of the Winnipeg Grain Growers's Guide. We hardly blame the Moncton branch for getting excited. The fact is that the Maritime Farmer has been letting rather too much light in on that wheat transaction. To find every other part of Canada pulling down thousands of dollars in wheat price increases, and the Maritime Province farmers ignored, is not just what the United Farmers' Guide would have conveyed to the farmers of the east. All that is required of them is that they vote Winnipeg. And so this little ladylike effusion resulted:

THE SUSSEX ANNANIAS

(United Farmers' Guide)

In the last issue of the Maritime Farmer, which might probably be more appropriately named the Sussex Annanias—with apologies to Annanias—returns with blood in its eye to the attack upon the organized farmers and the United Farmers' Guide. Apparently the editor of the Annanias has been taking some strong stimulant. But that editor is a modest fellow. He most modestly admits that he has scared the editor of the Grain Growers' Guide from his purpose—but forgets to say how or when. He unmasks several other deep plots that have been laid only in his own muddled brain. Truy the editor of the Sussex Annanias is a great exposer—chiefly of his own inability to be true to an editor's greatest obligation, namely to give his readers the truth.

The great editor who broods over Sussex finds that the unpatriotic graingrowers are eating Washington apples. He would have them all deported or sentenced to some terrible punishment. He conveniently overlooks the fact that Washington and California apples are today being sold all over New Brunswick after paying 90 cents a barrel duty to come into Canada. We would urge this ptariotic Annanias to investigate this matter before going further afield.

The Sussex Annanias still declares that the western grain growers are seeking to have a price fixed upon the 1920 wheat crop—despite the fact that there is not a single word of truth in the statement. Just for information on this subject we quote a telegram which we sent to Sir George Foster and his reply thereto.

May 25, 1920.

Sir George Foster, M.P.,
Minister of Trade and Commerce,
Ottawa, Ont.

Please advise by wire collect if the organized grain growers of western Canada either by delegation or otherwise have requested the Dominion government for a fixed price on the nineteen twenty wheat crop. If so when was the request made.

United Farmers' Guide.

Ottawa, Ont. 26th, 1920.

United Farmers' Guide,
Moncton, N. B.

Organized Grain Growers western Canada have not made formal request on Dominion Government for fixed price nineteen twenty wheat crop.

G. E. FOSTER.

Sir George Foster states truthfully that no such request has been made to the government in any way. This should settle the matter for any person whose mind is capable of normal functioning.

We trust that the readers of the United Farmers Guide will pardon us for not devoting any more space to our demented friend at Sussex. He can turn out falsehoods faster than we can answer them. But we have offered him $1,000 spot cash if he can prove his false statements. Money talks. He can't prove them and that is the reason why he dare not accept our challenge. Like every other Annanias when unmasked he resorts to noise and slander, but carefully avoids any chance of being made to eat his words.

We would suggest to our friend Annanias that he should not worry about the control of the United Farmers Guide. He should worry more about the bug or mania or whatever it is that at present controls his mind. He will find that his readers are not such simple minded dupes as he thinks them. They are seeing through his falsehoods. They are watching him play the part of choreboy to the Big Interests who are trying to wreck the organized farmers movement. They will get his measure. The organized farmers movement in the Maritime Provinces cannot be stemmed any more than it was in the other provinces of Canada. The farmers of Cauada have been fed up for years on falsehood and flattery and they have determined on a change.

The richest gem of all is the offer of the Sussex Annanias to place his journal at the disposal of a Maritime Farmers' organization. He has just wakened up to the fact that the Maritime farmers are organizing in conjunction with their fellow farmers in other provinces. He is now trying to get under cover and join the farmers on the band wagon that is leading to success. There is no room for traitors.

Finally the Sussex Annanias accuses the United aFrmers' Guide of Bolshevism, Radicalism and supporting the non-Partizan League. The fact is that the United Farmers' Guide has never supported any of them. But that makes no difference to Annanias. We are willing to pursue our steady course and leave the Maritime farmers to judge whether the United Farmers' Guide or Annanias serves them most faithfully.

ASK CONTINUANCE OF WHEAT CONTROL

Resolution by Executive of Canadian Council of Agriculture

Winnipeg, June 2.—(By Canadian Press.)—Asserting that the Canadian Wheat Board cannot exercise control over the 1920 crop unless its authority is renewed at the present session of Parliament, the executive of the Canadian Council of Agriculture tonight telegraphed the Dominion Government urging the necessity of the steps being taken to have the Government control the wheat crop at least another year.

The resolution of the executive committee, as forwarded to Ottawa, recalls a resolution of the Council of Agriculture adopted last Jauuary favoring Government control of the wheat crop of 1920-21, provided that "controlled buying should be continued on the part of overseas importers of Canadian wheat." The new resolution points out that the conventions of Alberta, Saskatchewan and Manitoba organized farmers subsequently approved of this resolution and asserts that "there is no indication of the lifting of the government control of buying on the part of countries importing Canadian wheat so as to affect the marketing of the next crop."

The resolution then continued:

"Whereas the present Canadian Wheat Board exists under and in virtue of the provisions of the War Measures Act, fortified by special act of Parliament, and cannot exercise its power over wheat grown in Canada in 1920 unless its existence is continued for another year by an act of Parliament at the present session,

"Therefore the executive committee of the Canadian Council of Agriculture would strongly urge the Government, before prorogation of the present session of Parliament, to take the necessary steps to have the powers of the Canadian Wheat Board continued for another year."

Many rumors were heard around the Grain Exchange today in regard to the control of coarse grains by Government as well as wheat.

The Winnipeg Free Press says:—"President J. E. Botterell, when asked concerning control of coarse said: 'We have had many communications from our secretary, Dr. Magill, in regard to certain amendments to the Grain Act. The last wire received from Dr. Magill indicates a great deal of agitation on the part of certain members of Parliament for continued control, and Dr. Magill states that, in his opinion, if control is confirmed, it will be made to include coarse grains as well as wheat; in short, it means nationalization of trade in all cereals.' "

An average of $1,023 was realized at an Aberdeen-Angus sale held by Glen C. Forgy in Indiana a few weeks ago, 44 head selling for $43,925. Three thousand six hundred dollars was paid for Krivinia of Alta, with calf at foot. Enchantress 26th brought: $2,800; Hoosier Violet Blackcap, calved Oct. 2, 1916, $2,650; Blackberry 21st, calved Sept. 9, 1915, for $2,550, and Ephemera Erica 3rd B., calved May 17, 1915, $2,700.

Gleanings of Agricultural Progress in New Brunswick

SUMMER CAMP FOR TEACHERS RURAL SCIENCE SCHOOL, SUSSEX, JULY 14th TO AUGUST 11th

This year for the first time in the history of the Rural Science School teachers will have an opportunity of living in camp and enjoying a recreation which would otherwise be impossible.

Financial assitance is given to those who take the course, also to any district that will take up school gardening under a duly qualified teacher.

Permission has been granted by the military authorities to use the Camp Grounds at Sussex, one of the bungalows and a certain number of bell tents. These will be fitted with cots, two or three to each tent. Every tent will be set on a board floor. The camp is but five minutes walk from the Agricultural Building.

Camping Optional

Living in camp is optional, and students must state clearly whether they wish to live in camp or desire us to send a list of boarding places to them. Students should avail themselves of the opportunity of living together in camp not only because it will be more economical, but because of the social life it affords. There will be no room rent, only the cost of food and cooking. Expense wil be divided according to the number actually in camp. Each student or member of the camp will have to provide his own blankets and pillow.

The free life of the open field and woodland appeals to every lover of nature. The facilities for studying the forest trees, ornamental trees and shrubs and life in the pools and running streams are but a few moments removed from the site of the camp. The fresh air, the sunshine and a chance to relax should be greatly appreciated by every teacher who has been confined to the school room for so many months.

The management of the camp will be left largely in the hands of the students. Committies will be formed to see that certain necessary activities of the camp are carried into effect. There will be few rules, but these must be strictly observed. A chaperon will be chosen.

The dining room will be established in one of the bungalows, near which all the tents will be set up. The camp will be supplied with water and electricity from thet own system.

Many games will be indulged in, as baseball, tennis, volley ball and others. The river, which is one of the sources of the Kennebecasis, affords excellent facilities for bathing, fishing, etc. Instruction in swimming, etc., will be given on request.

Only a limited number can be accommodated in camp. Apply now.

For particulars write Director of Elementary Agriculture, Sussex.

Rural Science Courses

The courses given are designed to give informtaion that will assist the teachers in carrying out the teaching of Nature Study and Elementary Agriculture as prescribed by the Board of Education of this province. Natrue Study and Elementary Agriculture is obligatory in all our schools in grades up to and including Grade VIII. of Graded Schools, and in all grades including Grade V. of Ungraded Schools. Apparently this fact is not recognized by some teachers. The Summer School affords an opportunity for teachers to familiarize themselves with this work. Better informed teachers is the biggest factor in the plan for the improvement of nature courses and for placing on a permanent basis every phase of the work. The qualification of the teacher is far more important than any text book.

The Science Camp

The four main courses given at the Summer School are: (1) Nature Study, touching ornamental, forest trees and shrubs, beneficial and injurious insects, textiles, etc. (2) Farm Physics, Principles underlying farm practices, road building, etc. (3) Gardening and horticulture in general. (4) Course in Cereal Husbandry and plant phisiology to take the place of Chemistry Course. Every effort is being made to make the courses as practical as possible.

Financial assistance is given to those who attend the Rural Science School. School gardens are maintained only by teachers who have taken special instruction in gardening and agriculture at the Summer School for teachers.

The Grant

For those who successfully complete one year at the Summer School, put in and maintain a garden at their school, the government offers a special grant of thirty dollars. To those taking the two summer courses a grant of fifty dollars will be paid.

The Bonus

Besides this a bonus of twenty dollars is granted to all teachers who will take either a one year or a two year course and will teach Nature Study and Agriculture with School Gardening the year subsequent to their attendance at the Summer School.

Railway Fare

Railway fare will be refunded to all teachers who attend the Rural Science School.

Assistance to School District

Where school gardens are established and properly maintained a grant of fifty dollars per year is given by the Department of Agriculture for the first year and thirty dollars for subsequent years.

Trustees and ratepayes of the rural districts should take advantage of this.

POULTRY CULLING DEMONSTRATIONS

The Poultry Division of the Department of Agriculture will devote considerable time during the present summer to culling work among farm flocks for the purpose of demonstrating the methods for selection and elimination of the poor laying birds from the flocks. Every flock of any size has poor producing individuals. In many flocks from 50 to 75 percent of the birds do not pay their way, but consume about as much food as a heavy layer. Such birds make very inferior breeders. They will in most cases transmit the low producing trait to their offspring. In a few cases last year 75 percent or more of the birds were discarded without decreasing the egg production in the least.

Blank forms similar to the following have been sent to farmers in several sections, and it is hoped that time will permit a demonstration with the flock of each farmer who returns same satisfactorily filled out.

POULTRY DIVISION

Are you willing to have your flock culled? .....
How many hens are in your flock....
What variety or varieties do you keep? .....
If not pure bred, state what blood predominates .....
Are you willing to put the unprofitable hens on the market immediately they are culled?.....
How many chickens do you expect to raise this year?.....
If you do not keep pure bred poultry would you like to start with hatching eggs or day-old chicks of heavy laying strains at reasonable prices next spring?.....
Would you favorably consider joining an egg circle if one were formed in your section?.....

A. C. McCULLOCH,
Poultry Superintendent

THE NEW BRUNSWICK RED CLOVER SEED CROP

Expansion in the red clover seed growing industry, the latest infant industry in the agriculture of the Province, is confidently looked for. Five years ago the total quantity produced of home grown seed, did not exceed one thousand pounds annually, while from the clover hap crop of 1919 there were threshed by one machine alone, owned and operated by the Department of Agriculture, over thirty thousand pounds. A considerable quantity of hay yet remaining to be threshed will make the yield of threshed seed nearly forty thousand pounds.

The policies of the Department of Agriculture, adopted for the improvement of soils and profitable crop production, favor and encourage the inclusion of the red clover seed crop as a cash crop from the farm.

The propaganda of the Department comprises a policy for supplying ground limestone, an essential fertilizer for the clover plant; the operation of a clover huller to thrash the ripened hay; a bonus toward the purchase of clover hulling machines by Agricultural Societies and a standing field crop competition for the clover crop, in which generous cash prizes are awarded for clean fields that are threshed for the seed.

One machine cannot do more than a small fraction of the threshing that is to be done in the future, and to aid the industry a bonus toward the purchase of machines by Agricultural Societies has been authorized by the Minister of Agriculture in accordance with which the following suggestions are made:

1. That the Agricultural Societies take up with their Municipal Councils the question of making an appropriation of $1,000 of fifty per cent of the cost of the outfit.
2. That the Agricultural Societies in any one County agrees to the payment of a further twenty-five per cent of the cost of $500.00; such payment to be made by authorizing the Department to retain out of their grant, on a pro rata membership basis, an amount necessary to make up this $500.00; the payment to be spread over a two year period.
3. That the Department of Agriculture will pay twenty-five per cent of the cost of this outfit or $500.00, which makes up the balance or full amount.

A clover threshing outfit, with the power necessary to drive it, can be bought for $2000.00. The makers of these machines have appraised us that an advance in the present quotations will be made shortly. Societies are urged to take prompt action in this matter.

COMBINED STANDING CROP AND CLEANED SEED COMPETITIONS FOR THE CLOVER SEED CROP

With the objects of extending the clover seed growing industry in this province, of improving the quality of the clover seed produced and of aiding the grower in marketing his crop, the Provincial Department of Agriculture and the Federal Seed Branch jointly offer to conduct a competition, with prize money of two hundred dollars. There must be fifteen entries, each of which produce 10 bushels of seed, or approximately five acres of crop.

The prizes will be based: 35 per cent on the awards of the judge for the Standing Seed Crop and sixty-five percent on the awards of the judge of the Cleaned Seed; the latter to be judged either in the sack on the premises of the competitor, or at a warehouse or Seed Fair to which the growers bring the specified quantity of seed by March of the following year.

The seed will be officially graded in accordance with existing commercial standards by an officer of the Seed Branch, who will return his awards to the Provincial Department of Agriculture, which will determine the final awards and issue the prize money.

The awards on the Standing Crop will be based upon the scores given the fields by the inspector who will judeg the crop from the standpoint of its suitability for seed purposes considering; purity of the variety, freedom from weeds, freedom from disease or insect injury, uniformity of maturity and probable yield.

The field inspection will be given when about three fourths of the heads have become brown. Notice must be given to the Department by the grower when this stage in the growth of the crop is attained to enable the inspector to time his arrival. He will advise any grower upon the method of harvesting and of the assistance offered by the Department to thresh the hay.

A number of growers who have threshed between 10 and 40 bushels of

(Continued on page 726)

Notes From the Nova Scotia Agricultural College

CLOVER SEED GROWING: NOW IS THE TIME

In 1919, farmers in Inverness, Antionish, Pictou, Colchester, Kings, Annapolis, Lunenburg and Halifax Counties grew several thousand pounds of clover seed. Thus they not only saved themselves from a cash outlay of 65c to 90c per lb. for their own seed this Spring, but, what is more important, they had, at small expense, ample supplies, so that they could use this soil-enriching seed generously.

On the other hand, many farmers who had to buy, cut down their orders because of the high cost involved. They thus lose the most valuable fodder crop they could grow, and their farms lose the increased fertility which clover growing always imparts to the soil.

The best way to grow clover seed is to cut the first crop of clover about June 20th to 25th. The second crop will thus get a good early start, and will in all likelihood provide a good crop of seed to be harvested in October. Sometimes a satisfactory crop of seed may be obtained by allowing the first growth of clover to thoroughly ripen, but it will not be as clean and generally not as heavy as the yield fom the second growth. The farmer who cuts his clover so early in the season will get a fair amount of fodder and when he has added to this the straw from the second crop, he will get almost as much fodder for feed purposes as if he had cut his crop in the ordinary way and he will have his valuable clover seed to the good.

A farmer in Antigonish County, Nova Scotia, cut one half acre of his clover on June 25th, 1919; he harvested from this half acre in the fall 215 pounds of clover seed of prime quality. Some of this he sold at eighty-five cents per lb. or at the rate of $365 per acre. Half the yield he obtained would have been a very profitable return for his work. Many other farmers in Nova Scotia could do as well as this man.

In respect to threshing this clover, write the Department of Agriculture, who annually operate one clover thresher in various parts of the Province, and who have bonused two other clover threshers, one in Kings County and one in Pictou County. The Department is also trying out a small easily portable machine, which will handle the clover after it has been put through an ordinary grain threshing mill.

Thousands of dollars could be saved by farmers in Nova Scotia, and thousands of dollars added to the fertility of the soils of Nova Scotia, if many more would copy the example of the foregoing Antigonish farmer.

NEW CREAMERY FOR CAPE BRETON

A few years ago the Government of Nova Scotia established a creamery at Baddeck and another at Margaree, in Cape Breton. Both of these Creameries have given such a good account of themselves that it has been decided to erect a third at Hawkesbury, Inverness County.

The new creamery will handle farmers' cream from points along the Inverness Railway to Inverness, along the C. N. R., to within striking distance of Sydney, and along the C. B. and St. Peters railway. By this it will be seen that there is no more strategic point for a creamery in Eastern Nova Scotia, and big things are expected.

Dairy Superintendent McKay is now on the ground laying plans. He has selected as field man to work up the business in this part of the country, Mr. D. W. Murray, of Scotsburn, N. S. Mr. Murray ws formerly president of the Nova Scotia Dairymens' Association, and is one of a group of men who made Scotsburn the most famous creamery in Eastern Canada.

EDITOR OF FARMERS' ADVOCATE VISITS NOVA SCOTIA

The longest established Agricultural paper in Canada is the Farmers' Advocte, published at London, Ont. Its senior editor, Mr. F. J. Porter, formerly of Lakeville, N. S., recently paid a visit to his old home, and spent a day at his Alma Mater. Mr. Porter is a graduate of the Nova Scotia Agricultural College.

In this connection it is worthy of note that the senior editor of Farm and Dairy, the leading Dairy periodical of Canada, published at Peterborough, Ont., Mr. F. E. Ellis, is also a graduate of the Truro institution. These are only two out of many graduates of the N. S. A. C., who have made good, and are now occupying responsible positions among the leaders in their line of work.

POTATO SPRAYING SEASON ALMOST HERE

The enormous loss from rot last year was very largely responsible for the extreme shortage of potatoes in Nova Scotia this Spring, a loss which could have been, to say the least, greatly reduced if farmers had taken the precaution to spray with Bordeaux Mixture from three to five times during the season.

There is no reason why this should not be done this year Moreover, there is every indication of a strong market at the close of the present season. The American Agriculturist reports that there is not a single State, hardly a single County, where the acreage under potatoes will be as large as last year, on account of shortage of farm labour and high prices for seed.

Spraying should begin when the plants are four or five inches high, which will be from the first of July in some parts of the Province to the first of August in others. The indications are that many more farmers will spray this year than last. Yet it is surprising how many farmers are not informed regarding the materials to be used, and who do not lay plans far enough in advance to secure these materials. Potato growers who are not posted on this question should write without delay to the N. S. Dept. of Agriculture, Truro, N. S., or to any Dominion Experimental Station, where they will get prompt information.

POTATO GROWING CONTEST IN WESTERN N. S.

A large number of entries have been received for the Potato Growing Contest, jointly arranged by the N. S. Dept. of Agriculture and the Dominion Atlantic Railway, for Western Annapolis, Digby and Yarmouth Counties. The principal condition required in this contest is that the fields entered must be sprayed with Bordeaux Mixture, or dusted with Bordeaux dust, at least four times during the season.

In order to make the campaign for increased spraying as successful as possible, the Entomological Branch, Dominion Dept. of Agriculture, will place one of their field men in the district of Clare, Digby Co., and the N. S. Dept. of Agriculture will place Mr. Murray MacConnell of Yarmouth, a former student at the Agricultural College, in Yarmouth County. The services of these men will be available not only to those who have entered the competition, but also to all who are interested in the important matter of preventing potato rot .

While these field men are instructed to visit as many farms as possible, they may easily overlook some who would be glad to have their assistance. A line dropped to the Agricultural College, Truro, or to Mr. George Saunders, Dominion Field Entomologist, Annapolis Royal, will ensure a call from one or the other at any point within reasonable distance.

BEE EXPERT FOR NOVA SCOTIA

An inspector for the Province of Nova Scotia, under the "Foul Brood Act, 1916," has recently been appointed in the person of Mr. Anthony Birch, B.S.A. Mr. Birch will assist in the administration of this Act, which has for its purpose the treatment and eradication of this sérious disease of bees. He is a graduate of MacDonald College, where he specialized in apiculture and allied subjects. He has also spent a season as assistant to the Dominion Apiarist, Ottawa.

The bee population of Nova Scotia concentrates in the Cornwallis Valley district, and this disease is practically confined to this region For the present, therefor, Mr Birch will make his headquarters at Wolfville. From there a determined effort will be put forth to reach and treat all cases of Foul Brood early in the season.

At the same time any bee grower in other parts of the Province, or any person who contemplates taking up this industry, will do well to apply to the College at Truro for the advice or services of Mr Birch. It is hoped that in time his activities will thus reach out to the whole bee growing interests of Nova Scotia.

NOT THE "ARMY WORM"

Numerous enquiries have recently reached the Agricultural College, especially from North Colchester and Cumberland Counties, regarding an invasion of caterpillars, erroneously supposed to be the "Army Worm." They are really the "Forest Tent Caterpillar." This is a large hairy caterpillar, about two inches long when full grown, with a row of green coloured spots down the middle of the back. Probably by the time this article reaches its readers, these will have disappeared, to reappear in different form later on.

When numerous, the Forest Tent Caterpillar will strip whole trees, then descend in a body and move on to other trees. The caterpillars are mature in about a month after hatching, and spin their cocoons in curled leaves or other sheltered locations. After remaining in this state for about three weeks, the adults will emerge as small brown moths. with two dark bands across the front wings.

Orchards which are regularly sprayed have little to fear from this pest, but where special measures are necessary, spraying with arsenate of lead should be resorted to. A strength of 2 libs. of the paste form to 40 gallons of water, or 1 lb. of the dry form to the same quantity of water, is sufficient to kill the newly hatched caterpillars. When they are half-grown or more the strength should be doubled. To prevent possible injury to the foliage from this strong spray, an equal quantity of water-slaked lime should be added to the mixture To protect uninfested trees from migrating caterpillars, banding with tree tanglefoot is the accepted remedy.

SUCCESS VIA THE N. S. A. C.

The next regular session of the Nova Scotia Agricultural College will commence on November 3rd, 1920. Last year's attendance was the largest in the history of the institution and everything points to yet larger numbers next session.

It is now time for farmers' sons and others to make plans for next winter. At no previous time could the College make a stronger appeal to the young agriculturists of the Maritime Provinces to take a course than at the present time.

The major portion of past graduates are now farming in various parts of Eastern Canada, and giving a good account of themselves. A considerable number, however, have fitted themselves for various professional situations as managers of Experimental farms, teachers in Agricultural Colleges, Editors of agricultural papers, County agricultural representatives, Inspectors under insect control Acts, etc. In fact, this very year, there were opportunities of good appointments for several more strong men than were available. The type of man required for most of these position is the man who has had a thorough grounding in the practice of farming, and who, in addition to this, has taken a complete Agricultural course.

Now is the time to write to the Principal of the Agricultural College for a calendar, in which will eb found information as to qualifications for entrance, cost of course and the studies to be taken up.

DEATH TO THE SCRUB BULL

Twenty Agricultural Societies in Nova Scotia have had their obundaries defined and approved by the Governor in Council, and now come under "The Scrub Bull Act, 1919". The provisions of this Act make it illegal for any party within the boundaries of an Agricultural Society to permit a scrub bull to be used for public service or to run at large.

The following is a copy of posters which are to be displayed in public places within the bounds of such Societies, to serve as a warning to scrub bull owners.

NOTICE TO OWNERS OF SCRUB BULLS

Scrub Sire Act

Chapter 28 of the Acts of 1919 Amended in Chapter 80 of the Acts of 1920

The boundaries of the..... Agricultural Society have been approved by the Governor-in-Council and on and after.....offenders of the above law are liable to prosecution.

Summary of Act

No owner or keeper of a scrub bull shall permit such bull to serve a cow within the boundaries of an Agricultural Society except a cow owned by himself.

Owners or keepers of Scrub Bulls within said boundaries must keep such bulls under full control at all times.

Special permits may be issued by the President or Secretary of the Society authorizing the keeper of a Scrub Bull to serve a cow in cases where it is impossible to obtain the services of a pure bred bull. Any services permitted without such authorization are illegal.

Copies of the Act and copies of the boundaries may be obtained from the Secretary of the Society.

By Order

DEPARTMENT OF AGRICULTURE,
Province of Nova Scotia

This marks a long step forward in the campaign for improved live stock in Nova Scotia. It is hoped that ere long practically all Agricultural Societies will have their boundaries defined and thus come under the provisions of the Act.

An amendment to the Act was passed in 1920 under which Live Stock Improvement Associations organized by the Live Stock Branch of the Federal Department may also enjoy the benefits of the Act.

THE MARITIME FARMER

And Co-operative Dairyman
Registered Trade Mark

Fortnightly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definite order for discontinuance is given,

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we beiieve that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written compiaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

JUNE 22, 1920

THE INFORMATION IS HERE

Elsewhere we publish an article from the United Farmer's Guide. It is headed "The Sussex Annanias." We particularly request every reader of this paper to read every word of it. It is a unique production. Among other things asked for is information as to how the Maritime Farmer scared the editor of the Grain Grower's Guide. We gave it in our last issue, but in order that the Moncton edition of the Winnipeg paper may have it again, we repeat; That in our issue of April 13th last, we published an article calling attention to an attempt in the part of the Grain Grower's Guide to blackmail the manufacturers of this country and force them to contribute funds to carry on what the Grain Grower's termed: "Its work in support of the policy of the organized farmers of western Canada." The writer of a series of articles, along these lines, was Mr. George F. Chipman, editor of the Grain Grower's Guide and managing editor of the United Farmers Guide. It was pure and unadulterated blackmail. Blackmail is a rather nasty practise. There are many men in the prisons of this country, who have tried it. Of course, as our laws are for rich and poor alike, the fellow who tries blackmailing to feed his family, usually gets caught. Big fellows, like the Grain Grower's Guide, however, needing neither raiment or food, usually get away with it. However, the scheme of Mr. Chipman was so absolutely rotten, that once it was exposed, the Grain Grower's Guide and its editor closed up like oysters. No more funds are being demanded of the manufacturers, (or should we say the big interests), by Mr. Chipman in support of the Grain Grower's Guide, in "its work in support of the policy of the organized farmers of Western Canada! ! Somebody stopped Mr. Chipman cold. We are rather inclined to think that possibly it was Mr. Crerar. Anyway, Mr. Chipman's little Italian way of doing things is no more. Is this a full answer to the United Farmer's Guide query? If the information is not full enough, we shall be glad to enlarge.

WHY THE SURPRISE?

The United Farmer's Guide is surprised that this paper should make an offer to support organized farmers of the East, so long as Winnipeg has nothing to say, and that the farmers get together in their own interests. Why the surprise? The Maritime Farmer had the opportunity of changing its name to the United Farmer's Guide, nearly a year ago. It was wooed but not won. The gallant "Young Lochinvar" came out of the west, and the Maritime Farmer could have been off the "old Maid's list" long ago. But somehow or other, we didn't like the look of the thing. We decided to maintain our independence and we think that we are filling a place in the interests of eastern agriculture. We have been abused, but what disappointed lover is there, who does not discover sooner or later that the girl who rejected him, "has a temper"; or "her nose is not what it should be" or "her mouth is two sizes and a half larger than normal". Why they all do it, and the Maritime Farmer is getting some of the dose. There is this about it, however, that we have said our little say in a way that people understand, and beyond the abuse of those who "are directly profiting" from the maintenance of a system, which we are mentioning elsewhere in this issue, we have little to complain of. Scores of letters come to us, endorsing our stand and asking us to stick to our guns. So that really, we feel that we represent a very wide section of the farmers of the Maritime Provinces, and that we are not waking up to any advantage to be gained by doing what we conceive to be our simple duty. So why the surprise? Let us remind the Guide that but for the Maritime Farmer's refusal, it might never have been heard of.

THE EGG TRADE

Elsewhere in this issue we publish a letter from Mr. G. R. Wilson, Dominion Poultry Representative, for New Brunswick, in which some excellent advise is given regarding the marketing of eggs. Too little time and care are bestowed on our eggs. They get to market, sometime, some way. They are depreciated in value before they reach storage centres. Mr. Wilson suggests a candling station. The idea is one that has been tried and proved in Prince Edward Island. Of course, as Mr. Wilson points out, New Brunswick has hardly reached the stage when this can be attempted with the hope of commercial success. The supply must be increased and a proper system devised for collecting. May the Maritime Farmer suggest that any proposition of this kind should be taken up either by or under the supervision of the Department of Agriculture, Fredericton. There should be "no secrets in the egg business" as Mr. Wilson says, and if we are to have co-operation in egg marketing, then the farmer should get the last cent out of it. There would be no need for "reserves" under government supervision. An annual statement could be published in which every last secret of the transaction could be thrown open to the public. Mr. Wilson is right. The dealers, too, would be much better pleased if eggs could be bought from a central candling station. But the most desirable feature is that any cooperative work should be done for the full benefit of all. There must be "no secrets" in the egg business.

BRINGING IN AMERICAN APPLES

The United Farmer's Guide says, referring to the editor of the Maritime Farmer: "He conveniently overlooks the fact that Washington and California apples are being sold all over New Brunswick after paying 90 cents a barrel duty to come into Canada."

It's a mistake. We haven't overlooked it. We couldn't overlook it if we tried. Twelve shops in Sussex alone have their front windows filled with United States apples, which they are selling as high as 84 cents per dozen. And yet the Grain Growers, of Winnipeg, are anxious to abolish the duty of 90 cents per barrel on these foreign apples and have still more of them dumped into our markets. This is a fact, isn't it? That's what the platform of the Canadian Council of Agriculture demands, isn't it? The Maritime Farmer would keep the markets of Canada, so far as possible, for the farmers of Canada, particularly the fruit markets. The United Farmer's Guide is in favor of wiping out the duty and the introduction of a further supply of United States grown apples. We would like to see the fruit growers of Nova Scotia and New Brunswick gettings the eighty-four cents per dozen for their apples.

LOOK AFTER THE WEEDS

The Maritime Farmer has time and again callel the attention of its readers to the alarming prevalence of weeds in Eastern Canada, and for the urgent need for concerted action on the part of the farmers, looking towards weed control. Everybody will admit that weels cause an enormous aggregate loss every year, and that they make farming increasingly difficult on account of the extra trouble involved in keeping them in subjection.

It is clear that the system of farming in vogue in most districts must be modified if ever the weeds are to be controlled. The haphazard method of growing crops without any approach to a system of rotation will never subdue weeds. The growing of hay for years on the same land, for example, allows ox-eye-daisy and couch grass to develop and spread without hindrance, and it is no wonder that these weeds have taken such strong hold of many of our farms. Moreover, the small attention that has been given by most farmers to the growing of root crops, such as corn, turnips, mangels, is responsible to some extent for the persistence of most of the weeds, for without these crops there is no way of cleaning the land, outside of costly summer fallows.

In a four-year rotation, such as grain—clover—grass—roots, the farmer is able to give his arable land a thorough cleaning every four years, and at the same time is able to get a handsome return from the land.

* * *

Woman, as a consumer, has a further duty than that of being a wise buyer. She must also be a conscientious buyer. She must realize her responsibility toward the labor and capital which has produced the goods which she buys, and in her capacity as a consumer and as a voter she must lend intelligent aid to the improvement of labor and economic conditions.

* * *

Pure-breds pay when given the proper opportunity. A pure-bred sire is "the biggest half of the herd" remember.

WHY SHOULD TIMOTHY AND CLOVER BE CUT?

So many factors and conditions on the farm may influence the time at which hay should be cut that a discussion of the subject may seem almost valueless. There is much need for information on the subject, however, and it is of so great importance that an analysis of the factors underlying it should prove of interest and value to the readers of the Maritime Farmer.

Yield, digestibility, palatability, ease of curing, losses in curing, and the influcnce the time of cutting on the aftergrowth must all be taken into consideiation in settling the time when the hay should be cut. The relative importance of each will, of course, vary widely with conditions such as weather, labor, the class of animals to which it is to be fed, etc. By far the most common hay crops in Maritime Canada are Timothy, Clover, or a mixture of the two. The present article will therefore be confined to a discussion of these two crops as affected by the time of cutting.

With Timothy the total yield of dry matter increases rapidly up to the time that the seed is formed, after which there is gradual decrease until the plant is ripe. The total digestible amount of the important food constituents is, however, a better indication of the value of the feed. The digestible protein, and carbohydrates are greatest at the time of full bloom, while the greatest amount of digestible fat is present when the seed has reached the dough stages. After reaching this stage the digestibility decreases very rapidly.

As regards palatability, this is the greatest in the early stages of the crop, and decreases gradually until the time of seed formation, after which there is a rapid decrease until the plant is thoroughly ripe. From the standpoint of total digestible nutrients and palatability Timothy should be cut immediately after full bloom.

Red Clover differs from Timothy in that with it the total yield of dry matter increases until maturity. The total amount of digestible protein and other food substances is, however, greatest at the time of full bloom. Little difficulty is ever experienced due to lack of palatability until the crop is well past the full bloom stage if it is well cured. This full bloom stage would thus seem to be the best time to cut Red Clover.

With Timothy and other grasses there is little difficulty in curing as a rule, and there is little loss due to the leaves or other parts of the plant breaking off. Some injury may be caused by leaching and bleaching but the losess therefrom are probably little different in early and late cut hay. With Red Clover, however, the situation is entirely different. Unless it is well cured there is apt to be much loss due to the leaves dropping off and also due to weathering unless good methods are followed.

Clover leaves are easily broken off in curing no matter when cut. As the plants reach the mature stage the leaves become dry and brittle and break off much more easily; while the stems become woody. Since a large part of the food value of clover is in the protein of the leaves, if these are lost the value of the clover is seriously reduced. All efforts should be made to retain them. Comparatively early cutting is therefore desirable from this standpoint.

Weather conditions may influence the time of cutting greatly. Little difficulty is experienced in curing timothy at any stage on account of its lateness in ripening. With Red Clover there is more difficulty on account of the plant being more sappy and because the weather is more apt to be unsettled. There are, therefore occasional cases where Red Clover may need to be left until after it has passed the best stage for cutting. This is, however, done with serious loss to the total value of the crop.

Since it is not possible to cut, cure and harvest the whole hay crop at once, some must be cut before it has reached the best stage or else the remaining part of the crop cannot be cut until after it has well passed the proper stage. Where crops reaching the proper stage for cutting at different times are grown, as fo instance where early clover, late clover, timothy and clover, and timothy alone, are grown, this difficulty is largely obviated and each may be cut and harvested at the right time. Where only one or two crops are grown this even distribution of the cutting season cannot be made, but since both Timothy and Clover decrease in their yeld of digestible nutrients after reaching the full blooming stage, and decrease rapidly in digestibility and palatability, and since in the case of clover, late cutting is very apt to be accompanied by serious loss of leaves in curing, it is advisable to plan to cut earlier, rather than later, than the optimum time.

The possibility of delays due to wet weather and other unforseen circumstances serves to emphasize this point, for often a week or ten days delay is caused thereby, with the result that the crop passes the best stage for cutting with an accompanying serious loss.

Another factor of considerable importance is the influence of late cutting on the aftergrowth. When clover is cut at or before full bloom is growth starts quickly and there is either a fair second crop or considerable aftermath. When cut late the plant is slow in starting and very little aftermath is produced. Timothy differs from clover in that it will not rpoduce two crops. It will, however, give considerable aftermath when cut early. Where pasture is desired, where clover is needed to enrich the soil, or where a seed crop of clover is hoped for, early cutting is necessary.

It is the opinion of the writer after much observation that the hay crop of the province is cut from one to three weeks later than is most profiitable. In travelling through the country it is not uncommon to see fields of timothy almost ready for seed, and clover fields that will give little more growth after cutting. Such crops have passed the stage of highest feeding value, they have lost much of their palatability and digestibility, and in the case of clovers particularly, there is apt to be much loss in curing.

When timothy is being left for seed it is of course necessary to leave it until nearly ripe. Red Clover on the other hand must be cut early so that a good second crop will develop. While for hay it should be cut shortly after full bloom, for seed it must be cut at least one week earlier. A full crop of hay and a second crop of seed cannot be expected in Quebec. The loss of a quarter or even a half ton of hay due to early cutting is, however, very largely made up by the extra aftergrowth in any case, and where a crop of seed is produced the loss is paid for many times over. Red Clover is scarce and expensive. Hardy, home-grown seed is much superior to imoprted seed lacking in hardiness. tI has been amply proven that clover seed can be successfully produced in the province. Farmers should plan to gorw their own seed.

Let clover for seed be cut quite early, clover for hay next, followed by clover and timothy mixed, and that in turn by timothy alone. Let all be cut sufficiently early to insure the maximum yield of digestible nutrients and that the feed be readily eaten by the class of stock to which it is to be fed.

CANADIAN AYRSHIRE RECORD OF PERFORMANCE

Of the 35 Ayrshire cows and heifers that qualified in the Canadian Record of Performance we observe some very creditable records. "Eastcourt Merrymaid"—37542—owned by the Nova Scotia Agricultural College, Truro, N. S., heads the mature class with 11,895 lbs. milk, 480 lbs. fat. She is sired by "Wee MasGregor" from "McQuittiston Secretary" (imp.) the dam "Princess Belle" was sired by "Prince Barcheskie" (imp.) Her best month's production was 1882 lbs. milk and 75.28 lbs. fat in November, 1918, and 1866.4 lbs. milk and 74.66 lbs. fat in December of the same year. "Rosette"—27134—owned by the School of Agriculture of Oka, La Trappe, Que., came next with 10,532 lbs. milk and 412 lbs. fat, her best month was in April, 1919, with 1370.50 lbs. milk and 55.87 lbs. fat. "Clover Ridge Glennet"—40986—owned by William E. Dryden, Cowansville, Que., had 10,496 lbs. milk and 359 lbs. fat, her best month was in March, 1919, with 1541.8 lbs. milk and 52.11 lbs. fat. "Bertha"—45551—by "Howie's Crusader" and owned by Bert R. Brown, York, P. E. I., had a record of 10,327 lbs. milk and 462 lbs. fat, her best month was in May, 1919, with 1578.5 lbs. milk and 71.00 lbs. fat, for the three months commencing with May of that year, she gave 4667 lbs. milk and 197.35 lbs. fat. "Beauty", owned by Gilbert McMillan, Huntingdon, Que., gave 10,320 lbs. milk and 390 lbs. fat, the following month she gave 1387.3 lbs. milk and 56.88 lbs. fat. The record this month is broken by a four year old "Lone Pine Belel"—49501—owned by Edwin Reid, Rollo Bay, P. E. I., with the production of 12,545 lbs. milk and 523 lbs. fat, her best month was in March, 1919, with 1505 lbs. milk and 60.20 lbs. fat, for the four months commencing with March she gave 5643.25 lbs. milk and 226.73 lbs. fat. "Glenhurst Pessara 2nd"—44511—owned by James Sorley & Sons, Ottawa, Ont., was next with 10,038 lbs. milk and 399 lbs. fat, her best months record was 1192 lbs. milk and 46.85 lbs. fat. In the three year old "Dairy Queen"—J56253—owned by John E. Turner & Sons, Orillia, Ont., heads the list with 10,102 lbs. milk and 453 lbs. fat. There were fewer two year olds than usual reported. "Milkmaid of Orkney 2nl"—59772—owned by Harmon MacPherson, Norwich, Ont., heads the list with 10412 lbs. milk and 446 lbs. fat, her best month was 1202.25 lbs. milk and 446 lbs. fat. There was great uniformity in the production of this heifer throughout the year.

USE MORE BEANS

(Experimental Farms Note)

The ripe bean is a form of food very much negletced in Canada. Lack of variety is one of the serious faults in our national diet. Many people seem inclined to use a very limited number of foods and, as far as possible, to make each day's meals resemble those of the day before; while, in other cases, the dull routine of a fixed seven-day cycle prevails. It is well-known that a varied diet is more wholesome than a restricted one, and, especially in these times when good food is scarce and high in price, it is really deplorable to note the neglect of some of the best Canadian-grown food materials, such as beans, peas, Indian-corn and barley, while an imported product, rice, remains quite popular in spite of its inferior quality as food and the commercial objection that Canadian money must be sent to some foreign country to pay for it.

Of all the neglectel foods, the bean is perhaps the most important. It contains a large percentage of protein (approximately double the amount found in cereals) and protein is the most expensive ingredient in the materials which we consume. The bean may fairly be said to rank first among the common foods of vegetable origin; peas are of almost equal value, but wheat and barley fall below. Oats also are distinctly inferior on the whole, though they contain much more fat than beans. While it is not true, as has sometimes been assumed, that vegetable protein, as found in beans, can entirely take the place of animal protein, as found in meats, eggs and milk, nevertheless the vegetable proteins have a high food value and the bean could, in many instances, be advantageously substituted for part of the meat ration. Considerable economy would be attained in this way, as beans are very cheap indeed in comparison with most animal products. It must be noted, however, that beans cannot be eaten freely by everyone. There are a few individuals for whom they seem quite unsuitable; but the vast majority of people would have better, cheaper and more enjoyable meals if beans were used more often. Matters of diet are so often settled by customs of the county rather than by intelligent thought that it is very hard to bring about changes, however desirable. Yet there seems no ogod reason why the regular use of beans should be limited almost to Massachusetts and a few other favoured localities. In these days when, owing to the high cost of living, many individuals are inclined to break away from some of the older and more expensive customs, the introduction of the bean as a regular article of diet offers an opportunity for the display of a little originality and the exercise of judicious economy at the same time.—Chas. E. Saunders, Dominion Cerealist.

CORN SMUT

(Experimental Farms Note)

The smut or corn is well known to farmers. The smut masses which usually appear as swollen outgrowths may be found on the ears, stem or leaves. These outgrowths are sometimes quite large and make the smut very conspicuous. They are at first covered by a thin membrane, which soon breaks away and exposes the black mass of spores. The mass soon becomes powdery and the myriads of spores which each mass contains are readily blown about by the wind. It is these spores that spread the disease during the growing season and carry the smut over the winter to the next crop.

In many of the smuits, as the smuts of oats and the stinking smut or bunt of wheat, the spores get on the seed and when the seed is planted begin growing with it and attack the young seedlings. Treatment with a solution of formaldehyde is effective in killing the spores on the seed and preventing infection of the young plants. In the cases of the loose smut of wheat and the loose smut of barley the spores are blown about at blossoming time and grow into the very young seed. The hot water treatment of the seed is used to kill the smut inside the seed. In the case of corn smut seed treatment of any kind has been found to be of no use, as the smut spores live over in the soil or in manure rather than in or on the seed. So the only way to control the corn smut is to prevent the smut spores getting into the soil or the manure. Not only lo the spores live in the manure pile for some time, but they may actually increase rapidly in number if the conditions are favourable.

Corn smut is found in all parts of Canada where corn is grown, but is more common in [illegible]da. Generally it is not very prevalent and the losses are not gdeat. Where it is common, measures should be taken to prevent its spread. The smut masses should be cut out during the growing season. They should be removed before they have broken open and spread their spores. They should not be left lying where they may reach manure or refuse and be carried back to the soil, but they should be gathered and burned. Rotation of crops is also valuable in preventing corn smut. The smut does not live long in the soil and will not attack any other crop, so time sould be given for the smut to die out in the soil before another crop of corn is planted. Seed treatment has not been found to be of any use in corn smut.—W. P. Fraser, Plant Pathologist.

HORTICULTURE.

APPLE SCAB DEVELOPING RAPIDLY

by G E. Saunders

During the past two days there has been a most unexpected and rapid development of apple scab on the leaves. This is a direct result of the rain on June 6th, which gave a period of moisture long enough to cause apple scab infection.

So far no infection of the fruit has been found, but the infection on the leaves is in some cases very serious, and unless prompt measures are taken, it will spread to the fruit as soon as there is a sufficiently long period of moisture.

Growers may rest assured that there are enough spores on the apple fruit now to cause a serious infection as soon as a long enough period of moisture comes to cause the spores to grow.

Growers are advised to spray or dust thoroughly at once, in order to prevent the fruit from becoming infected.

We are fortunate in having a most excellent set of apples, and a prospect of excellent prices for No. 1 and No. 2, while the No. 3's, canners, and evaporators do not promise such prices as last year.

THE FOURTH SPRAY

Two weeks after the blossoms fall. The material for this spray should be either 2-10-40 or 3-10-40 Bordeaux and 1 lb. of arsenate of lime to 40 gallons of water.

Very slight if any russetting will result from this spray and 3-10-40 may be used with safety and will give much better scab control.

The pests controlled by this spray are Apple Scab, "Pit Rot," Tussock Moth, Fall Webworm, Red Humped caterpiller, Yellow Necked caterpiller, Inky Spot and storage rots.

During the past season it was demonstrated that approximately three times as much storage rot would develop on sulphur sprayed apples as on those that received Bordeaux for the last spray.

Some years ago it was demonstrated that Inky Spot would develop in storage on sulphur sprayed apples but did not develop on those sprayed with Bordeaux.

This spray is especially valuable in protecting the fruit against late infections of apple scab and in the control of "Pit Rot." It is the most important factor in producing a large crop the following season by protecting the leaves from apples scab and so causing them to be retained until late in the fall and so producing a strong bud which is essential to a large crop the following year.—By G. E. Sanders.

NOT ENOUGH INSECTICIDES ORDERED TO PROTECT THE POTATO CROP OF NEW BRUNSWICK

During the past month it has been learned from various insecticide salesmen, that only a portion of the normal requirements of poisons have been ordered for the potato districts of New Brunswick. The reason given by the dealers is, "The farmers say that the cold has killed off the potato beetles, and there will be no need of using poison this year."

Invsetigation during the past two weeks in New Brunswick go to show that potato beetles are fully as numerous and as lively as ever. Ae report from Fredericton, May 31, 1920, states, "A large number of potato bettles on the wing."

In view of this fact there seems but little doubt thta unless orders are placed at once for more insecticides that there will be an acute shortage of poisons when spraying time comes. On account of the extreme high cost of growing potatoes at the present time, the grower must get the maximum crop in order to clear expenses, and also in view of the possible shortage facing us, it is in the interest of all to have potatoes produce the maximum this year. If potato beetles are not controlled the maximum crop cannot be produced.

It would seem good business for dealers to lay in larger stocks of poisons at once, in view of the probable shortage and its consequences.

Any of the common poisons may be ordered, arsenate of lime being preferred by the writer. Instructions for using all of the poisons will be issued later in these columns or may be obtained in writing A. G. Turney, Provincial Horticulturist, Fredericton, N. B., for a spray calendar.—By G. E. Sanders.

NEW VARIETIES OF WHEAT

Each province is shown by a series of articles in The Agricultural Gazette of Canada for May to have taken an important part in extending wheat cultivation. In Ontario a new variety of fall wheat called O.A.C. No. 104 has been produced by crossing Dawson's Golden Chaff with Bulgarian. This variety has beaten all other sorts in the province during a number of years. The Manitoba Agricultural College has devoted its work on wheat particularly to the classification of new strains and varieties, the making of variety tests, and, by hybridizing, the selection of pure lines and the production of better strains. A scheme for making available to all parts of the country varieties of the best kinds has been undertaken by the Ontario Agricultural College. The Field Husbandry Department is producing and selling to acredited growers and the provincial demonstration farms, seed of pure strain. The crop will be purchased back, properly cleaned, and again sold to farmers in the various agricultural societies throughout the province.

CONSERVING MOISTURE IN ORCHARD AND GARDEN

(Experimental Farms Note)

There are some parts of Canada where the rainfall is so light that it is impossible to grow crops successfully without irrigation, whereas at the other extreme there are districts where the rainfall is so heavy that it is impossible to grow many kinds of crops, because it is too wet; but in most places in Canada, while there is usually enough rainfall to grow a great variety of fruits and vegetables successfully, unless the moisture is prevented from evaporating from the soil, the fruits and vegetables will suffer badly in some seasons.

In orchards, if there is a lack of moisture just after blooming, the set of fruit will be materially reduced as there will be heavy dropping, hence the importance of beginning cultivation as early as possible, and at this season of the year. when there may be a severe drought, cultivation should be very thorough, the surface soil being kept loose by frequent stirring, and thus preventing to a large extent the evaporation of moisture. If moisture is conserved in the early part of the season it will be available for the crop when it is nearing maturity as, unless there is abundance of moisture at that time, the fruit will be small and the market value very much reduced. Hence, during the month of June much attention should be given to cultivation, as late in the month or at the beginning of July it will be necessary to stop cultivation in some places in order that seed for a cover crop be sown. In some parts it is necessary to cultivate until near the middle of July to insure sufficient moisture for the full development of the apple crop.

There are districts in Canada where the rainfall is so light that if the orchards are in sod there will not be enough moisture for the trees, and there are soils in districts where there is a moderate rainfall where there will not be enough moisture if the orchards are in sod.

The thorough cultivation of vegetables is even more important than for fruits. The root system of some vegetables is very shallow, and the plants will soon be affected unless the ground is kept cultivated. After each rain the surface soil should be loosened so as to conserve the moisture and let the air into the ground. Some vegetables, such as celery, require more moisture than others, and these are likely to suffer badly in a dry time. In districts where the rainfall is light and there are usually poor results in the average vegetable garden, very fine crops of vegetables are obtained by good gardeners who keep the surface soil loose practically all the time.—W. T. Macoun, Dominion Horticulturist.

CLOVER HARVESTING AND SEED GROWING

Seeding

Clover seed may be grown in almost any part of Canada, and on almost any kind of soil. Although special machiery may be used in handling clover seed, it is not absolutely necessary.

The soils most suitable for clover seed are: Clay loam and Sandy loam. Clay loam, however, gives better results, as it gives a brighter and plumper seed.

Clover should follow a cultivated crop, such as corn, roots or potatoes or it should be sown on land which has been thoroughly prepared after harvesting the previous crop.

Clovers may be sown with barley, wheat or oats, barley being preferred, however, on account of its being an early ripener and less liable to lodge. The growing of clover will not lessen the yield of grain per acre and will and will be found a great benefit in smothering many weeds.

When seeding clover with barley 1¾ to 2 bushels of barley should be sown per acre, with wheat 1½ to 1¾ bushels per acre and with oats 2 to 2½ bushels per acre.

With the above quantities of grain should be sown Common Red Clover at the rate of 8 pounds, Timothy, 6 6 pounds, Orchard Grass 6 pounds and Alsike 2 pounds. If the soil is rich in plant food, the total may be cut to 4 pounds less.—

Harvesting

Harvesting is one of the most particular points in clover seed growing. The first crop of hay must be

cut before July 1, to give second crop of the same year time to mature the seed. As to the time for harvesting the second crop for seed, no special date can be cet, as so much depends on the season. As a rule clover should be cut when the majority of the heads are well browned. It is a good plant to go over the field and rub a head here and there. If the seed will shell in the palm of the hand. it should be cut. If the seed is soft and not properly filled, it should stand even at the loss of a few ripe heads.

In cutting, while the mower with a table, the selfrake rasper and the self-binder may be used, the binder has been found to be the best machine for this purpose. When cutting with the binder, the cord should be removed and the spring slackened so as to allow the clover a free course to the ground. The clover, in dropping to the ground, will not shell and will be light, so that the wind and sun can easily dry it out, the windrow will be out of the way of the horses and machine and can easily be gathered with the barley fork.

The length of time which the clover should remain in the windrow depends on the weather and on the condition in which the clover is cut. It sometimes should be allowed to remain two or three weeks. The fodder ,however, should not be allowed to become black, as it would then be useless for feed. Just as soon as the forage will keep in the mow it should be gathered in. The seed can then be threshed almost any time.—John Fixer, Supervisor Division of Illustration Stations.

"HINTS ON FLAX HARVESTING"

Flax when grown for fibre is always pulled and not cut as wheat, oats or linseed flax. The exact time to uproot or pull the crop so as to secure the greatest financial return from the fibre and seed combined varies according to the conditions of labor and climate. It is not possible, however, to have all the seeds fully matured and yet product a first grade fibre. When growing the crop for fibre the seeds should be considered a secondary product.

The best yield of both fibre and seed may be obtained if the crop is pulled exactly in the middle of the period between the flowering and final ripening. When the stem is yellow and the leaves have fallen off, the crop may be considered as ready for harvesting. The easiest way for unskilled flax producers to determine when the flax is ripe or ready for pulling, is to select a few seed bolls, crack them between the fingers and if the seed faills out easily without adhering to the shell, it is then ripe.

Pulling.—It is of great importance to keep the tips of the roots well butted when pulling, as this renders the subsequent handling of the flax much easier. Any soil that may adhere to the roots should be shaken off. The bundles should be tied loosely, should be uniform in size and of about eight inches in diameter. About as much flax as can be conveniently caught between the hands should be pulled at a time, grasping it just below the seed bolls with the right hand, thumb downwards, left hand still lower and in the same position.

With unskilled labor great care should be taken to avoid pulling off the sedd bolls, as this is likely to occur if the flax becomes entangled. Each handful as pulled should be laid flat on the ground and more flax placed on the top, until there is sufficient to for ma bundle or sheaf. Short fiar should, if at all possible, be kept separate from the long, otherwise it is detrimental to it when undergoing the scutching process.—R. J. Hutchinson, Fibre Specialist.

CORROSIVE SUBLIMATE FOR CABBAGE MAGGOTS

In a recent number of Market Growers Journal, Prof. Arthur Gibson, of the Canadian Department of Agricultule, recommended the use of corrosive sublimate for control of Cabbage maggots. In this article the method of application was omitted. Mr. Gibson writes as follows in regard to this treatment:

"We have found the corrosive sublimate an excellent remedy in Ontario and I have no hesitation in recommending its use under your conditions. The method of application is simply to pour about one half a cupful of the liquid around the stem of each plant at the times mentioned in the article.

"Under commercial conditions we applied the liquid from a watering can, the spout of which was closed up so as to allow only a small stream to flow. In this way a small quantity of the liquid may be poured over the plants very quickly and a whole plantation covered in a comparatively short time."

Sixty-one Dollars Made $560 Possible

Two acres of stump land—$54 for stumping powder, fuse and caps—$7 for a helper, and J. V. Bradley blew out 78 stumps ranging from 16 to 35 inches in diameter. This is one of many things

C.X.L. Stumping Powder

will make possible on your farm. That $54 worth of stumping powder gave Mr. Bradley $40 worth of fuel, and the two acres produced a crop worth $520. It will do the same for you. It will make your waste land profitable at the lowest cost.

There is money to be made in agricultural blasting. Ask about it to-day.

COST OF PRODUCING MILK

A great deal has been written and published, especially during the last year or two, in regard to the cost of milk production in various parts of the United States and Canada.

As might be expected, there is considerable variation in the figures from various sections of the country and between different farms in the same locality, for no two farmers have the same conditions, whether these be favorable or unfavorable. for example, it is evident that the man who is operating a farm where there is an abundance of cheap pasturefi and at the same time enough tillble land to provide corn and hay for roughage, can produce milk more cheaply than the dairyman located on high priced land, where good but cheap pastures are lacking.

At the risk of repeating information which may already be in the posession of the reader, I wish to give briefly the results of a few of these inquiries. The following paragraph which is clipped from "Canadian Farm" of Nov. 19th, 1919 will go to show that investigations into the cost of producing milk have, in most cases at least, been conducted by impartial seekers after the truth.

"The Producer Vindicated"

"An interesting legal case has just been concluded in Chicago that throws considerable light upon who is responsible for the high cost of living. In 1917 the State officials of Illinois started an investigation into the cost of mlik supplied the city of Chicago. The State Attorney issued an indictment against the Milk Producers' Association controlling the supply. The office of the Association was raided and all of the records and correspondence of the Association seized by the State Attorney. Eight officials of the producers' organization were put on trial for conspiracy in unduly advancing the prices of milk. After many preliminary hearings and demands for bills of particulars, five of which were given by the state, the case started on Sept. 16, 1919, before a jury of city workers. The prosecuting attorney was extremely bitter in his prosecution, leaving no stone unturned to have the defendants proven guilty. Yet in spite of this and on the judgment of a jury of city consumers who would likely be prejudiced against the producers if they had any prejudice in the matter, all the defendants were declared innocent and free from any desire to raise prices for milk above what were considered fair and reasonable, allowing for cost of production and a fair profit on investment and labor. This, so far as we know, the first attempt to hang the guilt of the cost of living upon the shoulders of the farmer, has proven a distinct failure. Seekers for the responsibility for high prices will have to look elsewhere for the guilty party."

In 1912 Professor Warren of Cornell University, who is a recognized authority on farm management, conducted a survey in Deleware Co., New York, a hilly district where the land is quite similar to that of the Eastern Townships of Quebec. In this survey 174 farms and 5,308 cows were considered. The cost of producing 100 pounds of milk at that time and place was shown to be $2.60. The feed and bedding cost with cornmeal at $31.79 per ton, clover hay at $18.00 per ton, and other things in proportion, was $82.50 per cow and labor cost $22.45 per cow. Only one herd in eleven showed a profit above all expenses, and the average cow failed by $32.14 to pay expenses. On these same farms under the more favorable dairy conditions of 1913 the average cow was kept with a loss of $12.50. Dr. Warren has, after several years of very careful and extensive study of the matter, originated a formula for determining the approximate cost of producing milk in any locality.

According to the Rochester milk investigation, under the direction of Dr. Charles E. North, farmers in the Rochester territory have been losing an average of 85 cents per 100 pounds or one and one-eighth cents per quart on all milk produced for the year ending May 1st, 1919. These results are particularly interesting because the survey was conducted by a city committee for the purpose of reducing if possible the cost of milk to the consumer. Only about 6% of the cows in this survey gave over 9,000 pounds of milk per year. The average cost of production was $4.19 per 100 pounds or nine cents per quart, while the average price received was $3.35 per hundred pounds, or seven and and two-tents per quart.

By applying Dr. Warren's figures for Montreal, Professor Barton, of Macdonald College estimated that the cost of producing milk for the present winter (1919-20) would be about $3.52 per hundred pounds, and the highest cost for the winter $3.84 per hundred. It is interesting to note how closely these figures agree with those of Professor Leitch of the Ontario Agricultural College, who estimates the cost in Dundas Co., Ont., with prevailing prices of feed and labor, at $3.9 per hundred pounds.

In the month of December 1918 The Dairy Record Association of Summerest Co., New Jersey, where 376 cows were on record, estimote the feed and labor cose alone to be $3.81 per 100 pounds of milk. When interest on investment, depreciation, etc., are added the production cost is placed at $4.03.

Now I think we have given enough evidence to prove to our city friends, and others who carry the impression that farmers are more oo less a class of pofiteers that the dairyman at least is not mking undue profits from his business. If he were, there would not be 24,000 habitable farm houses unoccupied on the great dairy state of New York, and three men moving to the city for every one moving to the country. We speak of the high

(Continued on page 724)

It Pays to Feed Empire Feeds!

Cattlemen, farmers and dairymen have learned that it is profitable to buy stock feeds by proteins and that the feed containing the proper amount of proteins is the feed that brings results.

Another consideration steps in, however, and that is, that beyond a certain point, protein ingredients may be present in too great quantity for the animal to use, and there is waste.

EMPIRE FEEDS are rightly balanced

Empire Dairy and Hog Feeds contain not less than 16% proteins (*guaranteed*), which will be used for the nourishment of the animal, without waste.

We aim to put up feeds that will pay the user. Only good sound grains and other ingredients are used, and certainly no filler or other useless stuff will ever enter into EMPIRE FEEDS. Try a quantity for a fair testing time. We will abide by the resulting improvement in your stock. Ask your dealer for the honest feeds—EMPIRE BRANDS.

SCOUR IN CATTLE

Scour, scourings, skitters, flux, purgings, diarrhoea, or purgation, are terms applied to a too liquid state of the faeces of animals. The alteration in consistence may vary from a little softer than normal to almost as thin as water. There may be, and often are, other changes in the character of the faeces, such as variations in color, smell and quantity. The color may be much paler than normal on account of an admixture of white mucus from the bowel wall; or it may be darker if blood has exuded from the intestinal lining.

The passoge of blood-stained dung is usually termed dystentery or bloody flux. The characteristic smell is often replaced by a very foetid one, and this arises from 'gas liberated by abnormal processes at work in the faeces. An increase in the liquid composition arises from extra juices being poured into the bowel from its lining membrane.

Scour is thus an external sign that there is something wrong with the working of the alimentary canal chiefly the stomach and intestines. To say that an animal has diarrhoea does not solve the problem, for it is the cause of the diarrhoea that has to be found. The reason scouring attracts the farmers attention is that it is so easily seen, and the evidence remains wherever the animal has been. Other symptoms such as alteration in the breathing, pulse and temperature, would probably be found if looked for; and the stock-owner may then have to distinguish between scour and fever, both of which may of course which may exist in the case of inflammation of the bowels. Scouring is nevertheless an important symptom, because it is prominent in a number of curable conditions, and also because it occurs in several contagious diseases. Neglect of the presence of scour may thus cause the spread of infectious diseases, the loss of flesh, milk, or even stock.

In order to understand the ox's digestive apparatus it is only necessary to remember a few of the most mportanti features in connection with the structure and functions of the digestive tract. The mouth leads by way of the throat to the gullet, and this opens into enormous first stomach paunch, or rumen, which has in an adult cow a capacity of about forty gallons. The net or second stomaach leads from the first into the third stomach also called the bible or book on account of its numerous leaves between which the food is squeezed. All these structures are lined by a hard membrane, somewhat like the superficial layers of one's hand; but on entering the fourth or true stomach it changes to a soft lining roughly resembling the inside of the human mouth; and continues as such throughout the remainder of the tract.

The small intestine—about 120 feet in length—leads from the fourth stomach to the large intestine, which it joins near the open end of the blind gut. After a coiled course of about 30 feet the large bowel terminates at the vent or anus. The essential work of the alimntary canal is the taking in, breaking down, rendering soluble, and then absorbing all the digestible constituents of the food.

All unused and unacted upon portions are then passed out as dung. On its course the food is subjected to the actions of a number of secretions; in the mouth by the saliva in the process of chewing the cud; in the stomach by its juices; in the small intestine by a juice from this organ's own walls; by the bile from the liver; and by the pancreatic fluid from the pancreas or sweet bread. All these are important chemical processes, and for their proper fulfillment requires suitable foods, proper surroundings and adequate rest.

Improper foods and methods of feeding influence the activities of the bowels in a great number of ways. If, young pail-fed calves are suddenly placed on a hard and dry diet, the digestive aparatus is quickly called upon to do an increased amount of work. Should it fail in breaking down and softening the new food the indigested material irritates the smooth lining of the bowel, more fluid is poured out—as a rough tooth causes the mouth to water—and diarrhoea results. The remedy in such a case is obvious—the change must be carried out gradually.

During the first twelve months of their lives the vital processes of the calves are subjected to all kinds of changes, and this accounts for the prevalence of scour among them. The best of housing conditions and food are therefore necessary to prevent such changes from seriously upsetting the various bodily functions. In early life, with a diet of milk or its substitutes, there is little use for the rumen or paunch and this is accordingly small. With increasing age and harder food the rumen gradually assumes the great size of the adult.—

In level section of the country it is not a simple matter to provide a dry and firm barnyard during the spring and wet weather. Whee drainage is good a little planning will make a good barnyard, but where the lay of the land is level it means work and the outlay of some money to obtain a neat and attractive yard under all sorts of conditions. There is nothing much more annoying than to see cattle wade through mud and manure to their knees in order to reach the barn. The person who has to put up with such a yard is working under irritating conditions.

Not only does the poorly drained and muddy barnyard handicap and irritate a person, but it is unsanitary and makes the production of clean milk a much harder task. Men become used to certain conditions, that is, they do not fully comprehend the drawbacks of working under adverse circumstances, else they would improve them.

What can be done with a muddy barnyard? There are several ways of overcoming this condition. It may be drained if it is possible to lay tile for carrying the water away. Then some of the soil may be hauled away and replaced with good gravel to the depth of at least a foot. Soft coal ashes are also a good material. Where drainage is not possible and gravel or soft coal ashes cannot easily be obtained, the cheapest and most effective way of providing against a muddy barnyard is to cover it with concrete. The surface of the concrete should be left rough, as this will provide against slipping. We recognize that it is considerable work and will cost some money to make a firm, clean barnyard, but the time and money expended are well worth their cost.—Hoard's Dairyman.

There's Just One 100% Efficient CREAM SEPARATOR

And That's The

DE LAVAL

For Forty Years

The World's Standard

There may be a half-dozen plows, wagons, tractors, autos or other farm equipment to choose between, but no would-be imitator or utilizer of expired DeLaval patents has yet produced a cream separator comparable with the De Laval.

First in the beginning, De Laval machines have led in every step of cream separator improvement and development. Every year has presented some new feature or betterment, and the 1920 machines are still better than they have ever been before.

If you haven't seen or tried a new 1920 De Laval machine, any local agent will be glad to afford you the opportunity to do so.

If you don't know the nearest De Laval local agent simply address the nearest main office, as below.

THUMPS IN SWINE

An abnormal condition in swine, technically called "Spasm of the diaphragm," commonly called "Thumps" is usually caused by high feeding and want of exercise. It is seldom, if ever, noticed in swine, that, although they may be highly fed, are allowed a reasonable amount of green feed or its substitutes, and also allowed to take plenty of exercise. While really a disorder of the nerovus system, it is caused by disorder of the digestive system, which causes irritation to the stomach and bowels. It is commonly seen in young pigs that are kept in premises of limited space, and highly fed. It consists in a spasmodic or jerking contraction and relaxation of the diaphragm. The diaphragm is a fn-shaped muscle which separates the abdominal cavity from the chest or thoracic cavity.

The condition was for a long time believed to be a diseased condition of the heart, but this was a mistake. If the hand be placed over the heart, just at the elbow of the left fore leg, and the heart beats counted at the same time that the jerking contractions of the diaphragm are noted, it will be seen that there is no relation between the two. The direct cause of thumps is an irritation of the nerve that supplies the motive power to the liaphragm which is the same nerve that largely supplies the stomach, hence the most common cause is digestive derangement. Inflammation of the stomach and bowels is sometimes complicated by the development of thumps, but overloading the somach and lack of exercise are the most common causes. Diseases of the lungs or heart also may cause the trouble.

Symptoms.—The most prominent symptom is the jerking movement of the body. At each contraction of the diaphragm there is a bulging outwards of the flanks and a drawing inwards of the ribs. Sometimes at each thump there is a peculiar sound made, somewhat resembling the noise produced by hiccough in man. The symptoms are more or less marked, according to the severity of the attack, and are usually worse after a meal when the stomach is full. The thumping, in some cases, is forcible enough to cause the body to sway forwards and backwards. The thumping is usually irregular, but in rare cases may be regular and occu at the same time as the heart-beat, in which cases a mistake in diagnosis might be made. She course of the disease is variable. A recovery may take place in a few days, or the trouble may continue for weeks. In cases of long standing the animal loses flesh, and becomes run down and stunted.

Treatment. — Preventive treatment consists largely in giving young pigs plenty of room in which to exercise; light, airy quarters, with plenty of sunshine and laxative feed. Curative treatment consists in the administration of laxatives, as one-half to two ounces of Epsom salts or raw linseed oil, feeding lightly on laxative feed, and supplying a range where there will be plenty of room to exercise. If the spasms or jerking be excessive it can be controlled by administering five to fifteen drops of tincture of belladonna, according to the size of the patient. This should be diluted in a dessertspoonful of water and carefully administered, and may be repeated every two hours, as long as neecssary.

Eversion of the Rectum in Swine

Eversion of the rectum in swine is caused by either of two opposite conditions, that is, either constipation or diarrhoea. In the former case the rectum protrudes as the result of excessive straining in the endeavor to expel the contents of the impacted bowels; and in the latter case from excessive straining due to intestinal irritation.

Symptoms.—A portion of the rectum or its mucous membrane is noticed protruding out of the anus. In some cases it is noticeable only when the animal strains, and returns soon after straining ceases. In more severe cases the protrusion remains as a round, red ro purple-colored mass, which gradually becomes larger and darker. Later it may become dry and show cracks on its surface. It may be itchy and cause the patient to rub against any convenient object. If not treated it finally decomposes and may slough off.

Treatment.—As treatment is often unsatisfactory, the bowels should be in a normal condition by proper feeding and environment. When the condition is due to constipation, all the faeces that can be reached with the finger should be removed and the rectum injected with raw linseed oil. Wash the tumor with warm water and then apply strong alum water (as much powdered alum as warm water will dissolve) and carefully force back into position. Give the patient a laxative of one to four ounces of raw linseed oil (according to size) and feed lightly on easily-digested, laxative feed. Repeat the removal of the contents of the rectum every few hours, and after the removal inject about four tablespoonfuls of the alum water.

If diarrhoea be the cause of the trouble, the local treatment of the protrusion should be as above, but feed on dry, chopped grain and give one-half to two teaspoonfuls each of laudanum and powdered catechu in a little new milk every three or four hours until diarrhoea ceases. In either case it is sometimes necessary, in order to prevent re-eversion, to put a stitch of silk or catgut through the lips of the annus, or arrange a truss to cause pressure upon it. In such cases, of course, it is necessary to remove the obtruction each time the contents of the rectum are removed, except when it is escaping in fluid form.—Whip, in Farmers' Advocate.

Says the dairyman who knows separators

"Insist on the Separator with the Million Dollar Bowl"

Everyone knows that the Bowl is the whole separator—it is *there* that *all* the work is done—the profits all made. Therefore, if the Empire Bowl is superior, the separator must be superior. And our Million Dollar Bowl is superior. Considering the enormous additional butter-fat saving it will effect for dairy farmers, the Million Dollars spent in perfecting it is but a small item.

The trade mark below is the family "coat-of-arms" of the leading line of dairy machinery — EMPIRE. You will find it on the EMPIRE-BALTIC dealer's store.

Why does this Million Dollar Bowl save more butter-fat? BECAUSE—it is *self-centering, self-balancing* and *free from vibration* and you, as a dairyman know that vibration wastes butter-fat since it shakes the cream back into the milk after separation. This same freeness from vibration means greater endurance—that fact is obvious.

With the EMPIRE BALTIC on your farm you would have a better chance of making extra dairy profits than you could possibly have otherwise. Write for our catalogue 20

Live stock exchanges in Winnipeg, Toronto and Montreal especially encourage de-horning. Practically all the American native cattle, with which Canadian farmers in the west have to compete, have the advantage of being thus treated. They bring a larger return in dollars and cents.

In a circular by the Dominion Government, farmers are told that they will benefit for the following reasons:

1,—Better appearance of the cattle.

2,—Quieter, subdued nature of cattle, enabling fattening at less cost,

3.—More cattle can be shipped in one car by rail, saving freight cost.

But it is when the animal is finally brought to slaughter that the value of de-horning is proved. Over 70,000 pounds of meat a year are actually reported at inspected Canadian packing plants alone as wasted through bruises in the flesh. Most of the bruises are caused by the animal's horns while in transit from the farm to the market and the abattoir.

That total represents the parts of meat utterly thrown away. There is a further and even greater loss.

When a piece of meat is removed from a quarter of beef because of a bruise, the rest of the quarter or part of it has often to be sold at a cent and one-half or two cents a pound less —not because the meat is poor, but because that part has lost in appearance and sale value.

Probably one in every five cattle bought on Canadian stock yards suffers from injury which could be prevented were de-horning commonly practised.

The packers' buyer necessarily takes the loss into account and the farmer who sells cattle takes the risk and a lower price.

A united effort is now being made by the Dominion and Provincial Departments of Agriculture, the live stock exchanges throughout Canada and the meat packers collectively, to get a better knowledge diffused among Canadian farmers of the real importance of de-horning.—The Industrial and Development Council of Canadian Meat Packers.

IMPORTANCE OF THE SMALL HERD

The breder of cattle who owns only a few cows is an essential part of the forces that are carrying forward the interest of pure bred live stock. In many cases, however, he needs to understand more clearly his importance and to realize that the improvement of the breed he has selected is in his keeping and of others like him. While it is true that the sires of great reputation, and prize winners generally, are found in large herds, yet the lage herds ae comparatively few in number; an overwhelming majority of the good breeding cows are owned in small herds. The man with a small herd ought to exalt his calling and especially ought he to recognize his responsibility in upholding the quality of the breed he has chosen. The advantages are far from lying altogether with the one who owns an extensive herd. The principles of breeding, the history of the breed, the experience of master breeders are alike eccessible to all. Herd management, methods of feeding and plans for developing the calf are not limited by the number of breeding cows owned. Sources of information open to the extensive breeder are not denied to the small one. The man with 100 cows in his home pasture probably cannot learn more at the International than the man with ten. And while the bull in the big herd has an extensive opportunity to impress his excellence, yet the problems of mating may be essentially met with the sire in the small herd. The limiting factor usually is not the number of animals in the herd; it is apt to be found in the whole-hearted application by the man of his best energies to the task in hand. The tendency to undervalue his opportunity and to underestimate his contribution to the sum of the breed improvement and live stock excellence is apt to lead a man to carelessness, which causes him to fail to his best attainments.

IMPORTATIONS OF LIVE STOCK FROM THE UNITED KINGDOM

Upon inquiry of the Steamship Companies, it has been learned that importers are likely to experience considerable difficulty in securing transportation for stock from the United Kingdom to Canada during the coming summer. This is due to the heavy passenger and freight movement, space for which has been booked well in advance, and to the fact that few ships are available for the carriage of live stock and many of these can only be equipped at considerabe expense. Small shippers are likely to suffer most, in view of the fact that accommodation will probably be refused at all unless a minimum of business is offered. £250 has been suggested as the minimum which will be required.

The Steamship Companies indicated their desire and intention to meet the situation in the most practical way possible and the suggestion was made that, so far as possible, shippers should co-operate in making application for space by planning to assemble their purchases for shipment on a particular boat at a given date. Such an arrangement, it was intimated, would greatly facilitate business and justify the Steamship Companies in meeting the needs of the shippers. The Live Stock Branch will endeavor to facilitate any arrangement of this kind and will oe glad to receive letters from importers advising of their requirements. It is suggested, however, apart altogether from any assistance the Government may provide, that importers will do well to arrange for their shipment, in so far as possible, in accordance with the plan as above outlined.

HOW TO DEAL WITH CONTAGIOUS ABORTION

1. In purchasing pregnant cattle, make careful enquiries in order to ascertain if the herd from which they are being obtained is free from abortive disease.

2. If doubt exists as to their freedom from this disease, keep the newly obtained females separate until they calve.

3. As soon as a cow aborts remove her to a separate stable.

4. Thoroughly clean and whitewash the stalls in the stable. The bedding and litter removed from the stalls should be burned, together with the aborted fetus and the afterbirth.

5. Wash off the hind parts of all the exposed pregnant cows with an antiseptic solution.

6. Cleanse the genital passage of the aborting animal with mild, warm antiseptics. This should be repeated daily until the neck of the womb closes. If the washing of the womb is not desirable, make use of antiseptic powders in capsules.

7. Do not allow cows with retained after-births to remain in stalls adjacent to other pregnant cows.

8. Keep aborting cows separate from the others so long as they are discarging. Wash their hind parts before allowing them to return to the herd.

9. Allow a period of at least one or two months to elapse before returning aborting cows to the bull.

10. Wash the end and inside of the bull's sheath after sirvice of doubtful cows and before service of healthy cows.

11. Do not allow the bull to serve the aborting cows which have a discharge from the vulva.

12. Obtain the advice and guidance of a qualified veterinary surgeon as to the use of vaccines or bacterins, combined with the sanitary measures recommended.

13. If calves become affected with White Scours, immediately separate the sick ones from the healthy. Consult a reputable veterinary surgeon for special treatment and as to the use of special serums and bacterins in conjunction with sanitary measures.

14. In the case of valuable cows becoming barren the servimes of a skilled veterinarian should be obtained for the purpose of treating the womb and ovaries.

Antiseptic Preparations

For washing womb during retention of after-birth—1% solution of lysol or 0.1% solution of potassium permanganate. Use lukewarm. For flushing womb after expulsion or removal of after-birth—1% Lugol's solution of iodine, followed by a solution of 2 oz. each dairy galt and baking soda to a pail of lukewarm water.

For washing hind parts, including tails, hips and udders of aborting and exposed pregnant cows—2% solution of lysol or creolin.

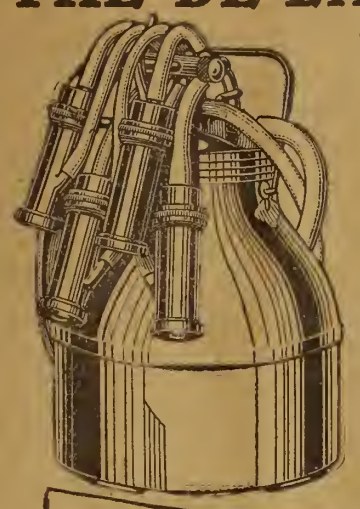
For washing sheath of bull—1% lysol or 3% borax. Capsule powder for disinfecting womb—½ oz. iodoform, ½ oz. boracic acid in gelatin capsule.

There will be no lamentation when the last scrub bull has been removed from Canadian herds.

When leading the bull to water or service keep an eye on him no matter how quiet he may appear. It is in the unguarded moment that he is most likely to strike.

THE DE LAVAL MILKER

What users say



The De Laval Milker was easily installed and the cows took very kindly to the change from hand milking to mechanical milking—all but one, so I sold her.

I milked 15 cows in from 30 to 35 minutes. It would take two men an hour to milk the fifteen cows without a machine. If I had to go back to hand milking at the present time, when it is so hard to get good hired help, I would sell the dairy at once.

A. E. BAIRD,
Valparaiso, Ind.

I was the first farmer in this part of New York State to put in the De Laval, and I bought it without seeing it or knowing anything about the way it operated; but I knew The De Laval Separator Company.

With the De Laval my wife and I milked 37 cows in 59 minutes with the three units and had only a few pounds of strippings.

The Udder Pulsator, with the alternate action and the master control on the Pulsator Pump, is certainly a great idea.

(Signed)
JAMES S. MORROW,
Richville, New York.

The De Laval Milker we purchased in August, 1917, has given us complete satisfaction. During this time it has never failed us.

We have a herd of 50 head of purebred Jerseys. Through indifferent hand milking, the udders of some of these were a little out of shape, but since milking these cows with the De Laval Milker, the teats and udders have improved and all trace of garget has disappeared.

The machine is simple, substantial, reliable and easy to operate. It is being operated by Mrs. Brook, the wife of the foreman.

THE HORSE

THE PREVENTIVE AND CURATIVE TREATMENT OF JOINT-ILL

Joint-ill annually exacts a heavy toll from the foal crop in this Dominion. It is more severe some seasons than others, and is often quite prevalent in some districts and absent from others. The theory upon which the veterinary profession base treatment is that the germ gains entrance through some raw surface, particularly the navel, at time of birth or shortly after. It locates in the joints, multiplies rapidly and gives rise to characteristic symptoms. It was once thought that the disease could be contracted before birth, and was therefore congenial, but modern science does not recognize this as a fact. However, the horsemen at several famous British studs still cling to the belief that preventive measures against pre-birth contraction of the disease are worth while, as the following excerpt from the Live-Stock Journal will indicate:

"A simple treatment adopted at the Carlton Stud of Messrs. James Forshaw and Sons, as a safeguard against joint-ill will save breeders many troubles with their foals. The treatment was adopted by the late James Forshaw, and has been consistently carried out ever since. When the foal is twelve hours old an injection is given of about a pint of warm water (about the temperature of milk when freshly drawn from the cow), to which a little soap has been added. The quantity of soap required is so small that it is sufficient to rub a little on the hands and wash it off into the water to be injected by an enema or rubber ball syringe, the latter being preferred. The whole of the liquid is slowly injected into the rectum. Even if there are signs of looseness or purging after this treatment the dose must be repeated in twenty-four hours.

"The reasons for the process are thus explained. Examination of the young foal often revealed the presence of hard dung, which in many cases could not be discharged until dissolved by the soap solution. This obstruction retarded the cleansing process, and the system became poisoned. A second injection is given because even though the foal may have shows signs of looseness small hard balls of dung have been found in the passage, and great importance is attached to thorough cleansing of the bowels. Without venturing any opinions as to the cause and cures of joint-ill which are matters for the scientists who are engaged on research work, the fact remains that at Carlton there has not been a case of joint-ill for twenty years, and it also important to know that the farmers in the districts surrounding the stud who have adopted the practice, have also had a remarkable immunity from this trouble.

"Another simple form of preventive treatment is adopted in Messrs. H. and H. Ainscough's old-established Burscough Shire Stud, in which there are at present fifteen out of sixteen mares in foal. A few days before foaling time iodide of potassium (five grames to each meal) is mixed night and morning with the mare's feed, and this quantity is given every second or third day. For three or four days after foaling the same doseis applied daily, and then every alternate day until the foal is eight or ten days old, after which time outbreaks of joint-ill are rare. In numerous cases on farms in the district a timely dose of iodide of potassium given to the dam—the foal gets the benefit through the mother's milk—had the desired result."

Preventive Treatment

If we accept the theory that infection occurs at or subsequent to birth, then it is obvious that measures should be taken to prevent the entrance of the germ into the system.

All dust, cobwebs, etc., should be swept out of the stable, and the stall in wihch the prospective foal is to be born, should be thoroughly and regularly cleaned, and it is good practice to scatter slaked lime on the floor each morning before providing fresh bedding. It is good practice to give the stall a thorough coat of hot lime wash with about 5 per cent. carbolic acid, or, if whitewash be objectionable give it a thorough scrubbing with hot water containing 5 per cent. of the acid. It is also good practcei to wash the extenral genital organs, tail and hind quarters of the mare occasionally with an antiseptic and germicide, as a 5 per cent. solution of one of the coal-tar antiseptics or carbolic acid. When the mare is to foal on grass, of course, all these precautions cannot be taken, but there is little danger of the germ existing on grass, but it may be found in sand or clay devoid of grass. The most essential preventive measures that can be observed in all cases is local attention to the navel as soon as possible after birth, and several times daily afterwards until it dries up and is thoroughly healed. The breeder should have on nand a supply of a strong antiseptic and germicide when his mare is about to foal, This may be a 10 per cent. solution of carbolic acid or one of the coal-tar antiseptics, tincture of iodine, or a solution of corosive sublimate 30 to 40 grains to a pint of water. Whatever is used should be applied as soon as possible after birth and every few hours until the navel opening is healed.

Symptoms of Joint-Ill

The symptoms may become apparent soon after the infection enters the system. From a few hours to a few days, and in rare cases a few weeks after birth, the foal is noticed to be dull, lies a great deal, and maniests lameness o stiffness in one or more lirbs.. An examination usually reveals a swelling, heat and tenderness of one or more joints, often in the hocks or knees, but it may be the stifle, hip, elbow, shoulder, fetlock or pastern. Any joint or joints may be affected. The trouble is often thought to have been caused by the dam treading upon the foal, or by injury or other ways. The symptoms increase in intensity, sometimes quickly, in others more slowly. The swellings increase in size and soreness, the patient become weaker, less able to move, and lies most of the time. If helped to his feet he goes lame and sore, but in some cases will nurse fairly well, but soon lies down again. As the symptoms increase in intensity the general debility also increasl es, and the desire for or the ability to take nourishment diminishes. The joint or joints involved become puffy, and if they burst or are lanced a

LOUDEN

Horse Stable Fittings

SAVE EXPENSIVE FEED

WHY continue to use that old wood manger and feed box from which your horses are constantly pulling expensive hay, oats and other feed on the floor and wasting it?

Some horses are worse than others. But watch your horses feeding, and you will find that they all waste feed.

Louden's Mangers, Oat Bowls and Hay Racks are made entirely of the best iron and steel and are designed to prevent wasting of feed. Test Louden Stable Fittings with your horses. You will find there are no conditions so difficult, Louden's cannot meet them.

In Louden Mangers and Oat Bowls there are no dark corners to collect dirt and breed disease germs. They are smooth, sanitary, and solidly built to last a lifetime.

Louden's Steel Stall P sts are perfectly smooth and unbreakable. The beautifully finished Louden Steel Stall Guards not only improve the appearance of the stable, but also permit of a free circulation of light and air—two important factors in maintaining health. They also prevent horses fighting over the stall partitions.

Taking into consideration the prevailing high prices of lumber and the feed-saving, healthful, permanent features of Louden Steel Stable Fittings, you will save money by installing Louden equipment.

Louden Stable Fittings also prevent any possibility of injury to valuable horses. Many animals have been badly injured and disfigured by poorly and improperly constructed stalls.

The Louden Catalogue contains valuable information on Horse Stable Fittings. Write for it.

If you are unable to decide on plans for your new barn or would like assistance in remodelling your old one, our Architectural Department will assist you. Our Barn Plan Book is free. Shall we send it with the Catalogue?

42 WELLINGTON ST. EAST, TORONTO

muddy-colored liquid escapes. In many cases the articular cartilages of the joint become destroyed. In these cases manipulation of the joint reveals a grating sound, caused by the ends of the bones rubbing against each other. When this stage has been reached it is a humane act to destroy the patient, as, though it may be possible in some cases to preserve life by careful nursing and attention, the animal will always be a cripple.

Curative Treatment

When a foal once contracts joint-ill its chances for complete recovery are not good, but success sometimes crowns one's efforts when treatment is persevered in. We cannot do better under this head than to reproduce the treatment recommended previously in these columns by Whip, which is as follows:

Curative treatment is often effective when given early. The use of serums and anti-toxins especially prepared for the purpose, and which can be administered only by a veterinarian, has been reasonably successful both as a preventive and cure, hence it is wise for a breeder to employ a veterinarian as soon as possible after the first symptoms are noticed. Even amateur treatment may occasion ally be successful.. It consists in bathing the joints long and often with hot water, and after bathing rubbing well with a camphorated liniment as made of ½ oz. tincture of iodine, 2 drams gum camphor, 4 oz. extract of wich hazel and alcohol to make a pint. The faol should be given 5 to 10 grains (according to class and size) of iodide of potassium in a little dam's milk three times daily, and it should be helped to nurse at least every hour if not able to nurse without help. The mare should be well fed on milk-producing feed, as bran, rolled oats, good hay, raw roots or grass if procurable, and should be given 1 to 1½ drams iodide of potassium 3 times daily. Such treatment may be successful in arresting the ravages of the germ and destroying those present. When the disease has reached that stage where abcesses are formed they should be lanced, and cavities flushed out well thre times daily with a 5 per cent. solution of carbolic acid. When the articular cartilages have been destroyed and the bones can be heard grating against each other, the patient should be destroyed.

FITTING THE HORSE COLLAR

Much trouble results on the average farm each year from sore shoulders on horses caused by the improper fitting of collars and improper adjustment of hames. The collar should fit the shoulder so that in length there is just room for the flat of one's hand between the collar and the neck at the bottom. In width the collar should fit snugly against the sides of the neck, from a point three inches above the shoulder joint to a point about half-way up to the top of the neck. The upper one-third to one-half of the collar should be wide neough to allow one to pass the thick of the hand between the collar and the side of the neck. If the upper part of the neck is thick a "Quarter-Sweaney" or "Half-Sweaney" collar shoulr be user, so as not to pinch the neck. A collar too wide at the top will produce a sore neck, on account of side motion of the collar as the rorse walks.

Sweat pads should be avoded, as they hold the heat and sweat and produce a tender shoulder, often causing a galled condition.

The hames should be adjusted so as to hold the collar snugly against the sides of the neck, and so as to bring the line of draft at right angles to the face of the shoulder as nearly as possible.

The collar should be kept clean by washing with a damp cloth each night when it is removed from the shoulder.

Washing the shoulder each evening with cold salt water will nelp to toughen the skin and prevent galls.—J. S. Montgomery, Univ. Farm, St. Paul, Minn.

HOW TO FEED WORK HORSE

I have a team of horses that weigh 2,600 pounds. They are workng hard every day drawing sand and stone. How much hay and oats will they require per day, and what will it cost to feed them with hay at $35 per ton and oat sat $1.30 per bushel?—Sub.

The exact quantity that should be fed a team can only be determined by the severity of the labor performed and the individual digestive capacity of the animals; horses differ in this relation to feed and energy spent. If the work is exceedingly heavy, the grain in the ration should be increased and the hay diminished, whereas, if the work s light, the grain should be diminished and the hay increased. The morning meal should be comparatively light, consisting mostly of grain. It should not possess much bulk. The mid-day ration should not be large. The heavy feedng should come at nght, after the day's work is over and when the horse has ample time to masticate and digest his food.

The quantity of hay and oats required per day for a team weighing 2,600 pounds will average, for hay, 28 to 30 pounds per day per team, and for oats 24 to 26 pounds per day per team. A great deal will depend upon the quality of the hay. Timothy hay that has been badly harvested or left till over-ripe has no feedng value at all—n fact, t is not at all a suitable feed for horses, beng too fibrous, and, if given in excessive quantities, will prove dangerous to the health. The cost per day for hay at $35 per ton would me about $2, and for oats $1.10 per day. It would be advisable to add a few pounds per day of bran t othe grain ration and this would increase the cost.

To get the best out of your feed through horse labor, by giving them power of endurcnae and at the same tme comfort at work, much of the successes will depend upon regularity in feeding. A very good practice to follow is to give one-fourth of the daily allowance at least one hour before going to work. It should be in a condition to be easily and rapidly consumed, so as to be well out of the way when the team is taken from the stable again. After beng watered the horses are ready for the forenoon work. If the work is exhaustive, they should be fed after five hours of labor. When they come to the stable at mid-day they should get a drink of fresh, cool water, and then another quarter of the daily feed ration. If possible they should get one hour to consume the noon-day meal. The horses will be greatly refreshed by removing the harness. Water again before going to work. At evening, after watering and thorough cleaning and drying, the team will be ready for the remainder of the daily ration. —Otawa Valley Journal.

MARE HAS BOTS

"Having noticed yesterday that a mare, five years old and in good health seemingly, passed a fairly large bot, I am afraid she has the bots. Kindly prescribe a treatment. The mare, although in good condi- and working every day, is rather rough in her coat and has a terrible appette. I am convniced she has what I believe to be the symptoms of bots."—A. G.

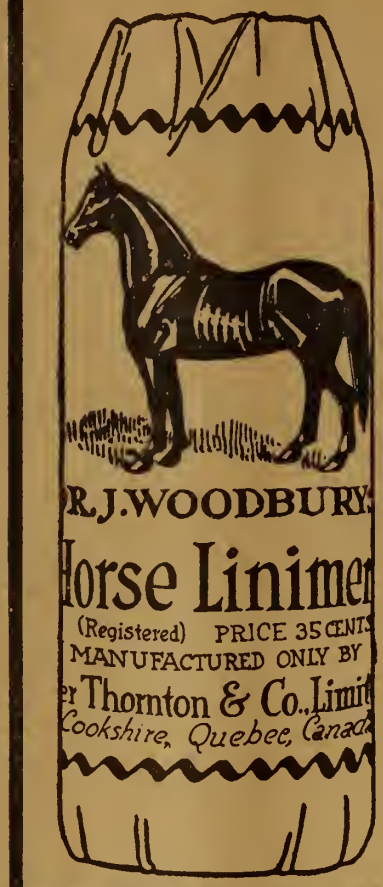
All horses that were exposed to the bot fly last summer have bots. During the spring the bots let go their hold on the membrane of the stomach and pass from the body in the feces. Some of them burrow in earth or manure and develop into flies to bother the horse the coming summer. They usually pass, as you have stated and do not interfere with the health of the animal. The only occasions on which they interfere with health is when they let go of the stomach in large numbers, form into a ball, and acclude the passage into the intestines. This seldom occurs and when it does it causes violent symptoms, soon followed by death. So long as the bots continue to be expelled per rectum you have no cause for alarm. No treatment has been discovered to hasten this process.

WORMS IN HORSES

Kindly give me a recipe for worms for horses.—W. S. M.

Reply: There are two kinds of worms in horses, one living in the intestines proper, and the other living almost exclusively in the anus. The former are not unlike the common earth worm in size; the latter is much smaller, and resembles in size and color a piece of white thread an inch or so long. Give your horse a purge and watch the feces for the variety of worm found. For the intestinal worm give internally oil of turpentine, two ounces; oil of male fern, one drachm; linseed oil, half a pint. Give on an empty stomach after a purge .

If the thread worm, inject up the rectum every other day for a week the following mixture: common salt, half an ounce; carbolic acid, half a drachm; water, one pint.



Every Farmer and Horseman Should Have This Liniment

It means many a dollar saved in time and work; because it quickly makes lame, crippled horses sound as a dollar. No matter what the trouble—whether it is an old Strain, or Sore—a Spavin, Cracked Hoof, Curb or Splint—a fresh Cut or Bruise—an Enlargement or Bunch—you can get rid of it right off by treating the animal with

Dr. J. Woodbury's HORSE LINIMENT AND CONDITION POWDERS

Used internally, the Liniment is a sure acting remedy for Colic, Kidney Trouble, Coughs, Colds and Heaves; while the Powders tone up the general system and help the horse to improve.

Hawkshaw, N.B.

"You may put me on your list of users of Dr. J. Woodbury's Horse Liniment. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable."

G. E. CRONKHITE, Horseman.

Your Druggist or General Store will have these reliable remedies. Get a package of each, so you will have the right thing in case of sickness or accident to your stock.

POULTRY.

THE PRESERVING OF EGGS IN THE HOME

(By W. A. Brown, Live Stock Branch, Otawa)

Eggs are a perishable food product, and while their production is distributed throughout the year with much greater uniformity than many other products, yet it is a fact that new-laid eggs are usually scarce and high in price betweenth months of October and February and plentiful and comparatively low in price in the spring and early summer months.

The cost of preserving eggs by artificial refrigeration is considerable, and while it is not believed that any liquid preservatives will give better results than those obtained in a well built and carefully managed cold storages, yet it is conceded that there are times when those consumers, who will go to the trouble and take the necessary precautions, will find it to their advantage to preserve a reasonable quantity for home use.

Methods of Home Preservation, Recommended

As the result of much technical investigation and years of practical test it has been found that the best results can be obained from the use of water-glass and lime-water. While the lime water method is undoubtedly less expensive and just as efficient, yet popular opinion seems to be constantly growing in favor of water-glass.

The Use of Water-Glass

Water-glass is a solution of silicate of soda, and may be obtained from practicall all druggists. A 10 per cent. solution is generally used, that is one part of water-glass is fixed with nine parts of water.

The water should first be boiled in order to destroy all vegetable or animal substances contained therein. The two substances are then thoroughly mixed, and the solution allowed to stand until it becomes quite cold before using.

Lime Water Method

Previous to the advent of artificial refrigeration, lime-water was used commercially to a large extent. Some large dealers still use it to supplement cold storage, and many people use it as a home preservative. Although authorities differ somewhat as to the relative amounts of lime and water to be used, the proportions of 2 pounds of lime to 5 gallons of water are generally recommended. It is important, however, that the water take into solution as much lime as it is capable of holding. A quantity of fine salt in proportions of about 1 pint to the above is also frequently added. The mixture should be kept well stirred for a few hours, and then allowed to settle. The supernatant liquid is then drawn off, and poured over the eggs. In order that the solution may be kept saturated and of uniform strength throoughout it is customary to add a little lime from time to time, or better, to keep a cloth covered with lime just touching the surface.

Containers

Any receptacle that is impervious to, and does not corrode in, water is suitable for holdink the eggs. Glazed earthenware crocks, galvanized tubs or buckets, or wooden tubs or kegs are most frequently used. In the case of wooden receptacles it is desirable to let them stand filld with water for several days, and then to scald them and cleanse them thoroughly before using. For home consumption it is best to have a number of small containers holding not more than five or six dozen each. Covers should be placed over all containers and these, when filled, should be stored in a cool, dry place in the cellar.

The Selection of Egsg for Preservation

Best results are obtained from eggs which are put down in April and May. At this time, eggs are not only abundant and cheaper in price than later, but they are also fuller, stronger bodied, and of all-round better quality than those available durnig the hot weather. An important and safe precaution is to candle all eggs. This is not a difficult or complicated process, for fortunately an eggs is semi-transparent when held before a light in a darkened room and permits, if carefully rotated of even minor defects being seen.

FIGHTING LICE AND MITES

Many people wonder why their fowls do not lay better during the summer months. I am oftentimes asked to explain why certain flocks do not pay and it is rather astonishing to find what meagre efforts are put forth to control some of the worst pests invading the poultry premises.

There are many poultrymen, farmers and farmers' wives who rarely or never think of spraying their poultry houses or, more especially, disinfecting the roosts and roosting quarters. I have seen poultry houses in different parts of the country literally infested with thousands of lice and little red mites. The lice bother the hens practically all of the time and

even in well cared-for flocks there may be a few lice present. On the other hand, where lice are allowed to increase in large numbers they bother the hens all of the time and affect egg production. The little red mites stay in the poultry house around the roosting quarters during the day time but at night they sap the vitaliy of the hens and this usually affects egg laying.

There are different kinds of lice and mites and in warm weather they breed very rapidly, so that every one who has even a few fowls should make evey effort to keep them under control.

Provide the hens with a dust bath where they can dust themselves at will. This will help to keep the lice in check. Disinfect the poultry houses and particularly the roosts and roosting quarters every week during hot weather. There is no way to keep the lice and mites in check except through perseverance. We find a 10% solution of any of the good commercial disinfectants to be quite effective. This can be sprayed throughout the house soaking the roosting quarters thoroughly. Coal oil does a certain amount of good but where the houses are disinfected once or twice every week there really should not be any trouble from these pests. Where a small flock of birds are badly infested it wil doubtless pay to disinfect the birds individually with dusting powder. Take each bird in the left hand, hold the head downward and sift the dusting powder well into the feathers, then with the right hand rub it thoroughly around the joints. A good lice powder may be made of 3 parts of gasoline and 1 part of 90% to 95% carbolic acid: mix together and add to this enough plaster of Paris to take up the moisture. It usually takes about 4 parts of plaster of Paris to 1 part of the liquid and while being mixed they should be thoroughly stirred. This powder is applied in the same way as described above. Good egg production during the summer months can only be secured where the poultry premises are clean and sanitary and where the fowls are comparatively free of lice and mites.—M. A. Jull.

Poultry manure is undoubtedly the richest manure produced on the farm. In common with all other manures it has not a fixed composition, but the fact that the liquid and solid excreta are voded together as a moist mass insures against the loss of drainage of urine, unavoidable to some degree with larger domestic animals and explains in parts its high nitrogen content. Another reason for its richness in nitrogen and phosphoric acid may be foud in the character of the feed used. This is especially true with respect to laying stock, to which it is customary to feed meat scraps, green bone and similar products with high percentages of nitrogen and phosphoric acid. —Shutt.

Poultry manure being essentially nitrogenous, is particularly valuable for garden and leafy crops generally.

The poultry keeper who does things in the usual way often makes a fair profit but it is the poultry keeper who carefully attends to the little things that makes he greatest success.

If you are in the poultry business for the eggs there are in it, then get the laying kind or in other words spot the non-layers, soup them and take better care of the balance.

Poultry must have grit and in the winter when they are housed more or less of the time, they should be supplied with grit.

Destroy the Insect Pest
You need a perfect insect destroyer, not only for your poultry, but for the garden, live-stock, everywhere.
Instantly kills all insects on squash, pumpkin and melon vines, on rose bushes, currant bushes and cabbage plants. Rids your Poultry, your Horses, Cows, Dogs and Cats of fleas, lice and mites.
Drives out moths and bugs from closets, carpets and clothing.
Pratts Powdered Lice Killer
is perfectly harmless to use. Cannot injure people, fowls or animals, but is sure death to lice and other insects.

EDWARD'S FIRST BABY

(By Claudia Cranston)

AS SOON as he came into my sitting room that evening, I knew he was going to ask me one of those momentous questions the second generation of my family is always bringing to me. And, having lived through almost every question myself, and lived through them over again through my children, I sat complacently and waited.

Edward's brown hair curled damply above his temples, just as his grandfather's had at his age, and the way he dragged his grandfthear's chair across the old rag carpet and sat gazing into the crackling fire—with the selfsame shrug of shoulder, the selfsame wrinkle up and down between his brows—made me forget for a moment the roll of the years. But my eyes fell on my hands at my knitting, wrinkled, stiffened a little at the joints with a thousand tasks, and thin so my wedding-ring—my wedding ring that was such a snug fit—is quite loose now.

And I thought that when the finger got thin enough for the ring to slip from it, then I should know my work had slipped from me. And, some way, the ring seemed a little looser tonight, and I thought how sweetly the grass blew in the breeze out there where Edward's grandfather lay, how erstful beside him, the spot laid out for me.

And then a sudden upshooting of the flame in the fire-place caught and glowed on the wedding-ring on Edward's finger, as he raised his hand to push those damp curls back. And I remembered his dear little son just three months old, my own great-grandchild, my own dear Edward's Edward's son, and his first pair of socks not even knitted, and his first tooth not even cut, and I said to myself, "Dear me, see all there is yet to be done before you go."

AND it was then Edward asked me the question. "Grandrother," he said, and laughed, but I knew from the way he repeated the word "Grandmother," the second time, that this was no chance pleasantry at my expense, but a set speech studied out beforehand. "Grandmother, how much time can a man spend away from his family, and still retain one hundred per cent. affection?

I kept right on knitting, until I turned the difficult place in the shoulder of Emily's sweater. Then I stopped, laid down my knitting carefully on my lap, as I always do, with the knobs of the needles towards me.

Then I asked Edward what he always did when he was angry.

"Why, you know," he said suprised, "what father does, what grandfather always did, 'count ten before you speak, sleep over it before you write.' "

"Well," I said, "I have counted ten, and I do not feel any better about your question. I judge I had better sleep over it. Young people are so—"

I caught myself up suddenly. I was going to say "so irreverent." but he did not look irreverent. He looked troubled. And it came to me, and frightened me, that, perhaps, I had better pray over it, instead of merely sleep over it. There had never been anything "like that" in our family. Affection, fondness and fidelity to family life had been one of the natural qualities of us all so far.

Edward's wife was a pretty, sweet young girl, who had made a comfortable home for him we had all enjoyed. She used to give such good dinners to the family, she used to make their little sitting-room seem so cozy in the evening, she used to—

And suddenly I realized that I was using the past tense quite a bit for a couple in only their second married year. And I remembered that there had not been a family dinner at Edward's house in, well in a long time, and that I had not really been there in the evening in, well in a long time.

AND there sat Edward, his lips drooped in those identical little petulant lines I used to kiss out of his grandfather's lips, or scold out, or "silence" out. So, for the moment, I decided upon silence. I told Edward I was tired, and thought I had better go to bed, and gently sent him home.

After he left, I raked down the fire and bedded the coals, a sort of sacrament to me since he had gone whose last task it had been. I never let any one else do it, not once. Then I went upstairs to my room and sat for a long time looking out at the window at the line of hills, set with their heads together like litle haycocks in the moonlight.

I had thought I knew every inch of Edward Third's soul, as I had known the soul of my own Edward the First, he whose regal mind to both of us a kingdom was. I had thought I knew my grandson's thoughts just as well as I knew every line of his face, every gesture of those capable hands. And yet, here was something alien to our whole clan cropping out in the third generation.

Mull the thing about in my mind as I might, no light came to me. Indeed, the more I thought back, the deeper the situation grew, for I remembered significant things now—a word dropped by Emily about Edward going so often on business trips to Atlanta, a casual mention by Edward's wife that she did not wait dinner because she was never sure whether Edward would be home or not, a bit of a popular song I had heard one of the neighbor boys sing only last week, as Edward, wearing a new suit and carrying a cane, took the train for the city on a business trip.

At the time, I had thought only what bad taste young people had nowadays. Now, my cheeks burned at the remembrance of the words. And I wondered if the young people really did show some reflection of their thoughts and lives in their songs. Certainly, when I was young, we never sang such words as those. Certainly, in the fragrant days of my youth, the sweet old songs had meant something to me—and to Edward.

THEN as I turned from the window, I tried to laugh at the whole weird panorama, though I felt my hand tremble against my damp cheek, and I undressed in the white moonlight, with the words of my husband's favorite song, "In the Gloaming, Oh, My Darling," weaving faintly through my troubled thought, like church bells far away.

I was scarcely asleep when I was awakened by pounding on my bedroom door; not knocking, but pounding. And when I had thrown on my eiderdown bathrobe and opened the door, there was Edward.

"The baby is dying," he said, "and we want wou to come. Maybe you can do something."

Was I dreaming? I stood and blinked.

"He is dying," Edward repeated, in such a strange, motionless, dry voice, I thought i mIght still be dreaming.

I dressed and went with him.

There ewere two doctors and a nurse, and Edward's wife, and her mother. The baby did seem to be dying, breathing in dreadful lurches, and purplish in the face.

"Started as croup," said old Doctor Bloomby, almost as old as I am, and our family physician. "Still croup, I say, thought it may have a new name nowadays."

We were talking in the sitting-room, for with two doctors and a nurse what was there for me to do?

"I believe he will pull through," I said, after going in the room again for a moment to look at him.

"May do it; probably will," Doctor Bloomby replied gruffly. "Fightin' stock, never say die." And we smiled at each other, remembering many's the croupy baby we had sat up with together until the first faint streak of dawn.

And so we wore away the hours of the night—the old doctor and I mostly together, the young doctor and the nurse working over the baby, Edward's wife and her mother relying some way upon each other, as mother and daughter do.

BUT Edward, where was he? Several times I went to the door of his room. And there he sat, in a chair in the middle of the room, a chair which did not belong there at all, a dining room chair I had seen him carrying aimlessly about early in the night. There he sat and stared before him, and spoke not a word when I made my pilgrimages to look in upon him.

In about half an hour a single piercing shriek from the baby rang through the still house like a shot, and was followed by the regular monotonous familiar cries of a sick child getting back the full play of his lungs after croup.

At the first cry, I heard a thump in Edward's room, like nothing but the sudden overturning of that dining-room chair. I surmised that he had dozed off to leep sitting there, and that cry had startled him.

Then it go to be four o'clock, and Edward's wife had not come out of the room, and no one offered her mother or me a bed to sleep in. And the crying had not ceased a moment. Finally, at four-thirty, I went to Edward's room. For all my weariness, my heart was full of thankfulness that his little son was saved, and words of tenderness and congratulation upon my lips.

As I went down the hall toward his room, I heard him walking up and down, up and down. And when I stood at the door, there was the dining-room chair still overturned in the middle of the floor, Edward as white as a sheet, his collar unfastened, his tie streaming down one side of his shirt like a crimson cut, his fingers run through his hair until it stood on end.

He came toward me and stepped close as I shrank back into the hall; the baby gave an extra loud yell, and Edward said distnctily, between clenched teeth, "I wish that baby would die!"

THE words of tenderness were frozen on my lips. Speechless I stood, and shook to my marrow

Make good stoves and Cooking utensils.

THE AFTER EFFECTS OF THE "FLU"

Has Left Many Weak Hearts.

This terrible scourge has left in its train weak hearts, shattered nerves, and a general run-down condition of the system.

Thousands of people, throughout Canada, are now needing the timely use of Milburn's Heart and Nerve Pills to counteract the effects of this trouble which a short time ago swept our country.

Mrs. C. C. Palmer, Keppel, Sask., writes:—"I wish to inform you of the great good Milburn's Heart and Nerve Pills did for me. After a bad attack of the "Spanish Influenza," my heart and nerves were left in a very bad condition. I got two boxes of your pills and I must say they are the best I ever used, and I have taken a great many different kinds. I will always keep Heart and Nerve Pills in the house."

Milburn's Heart and Nerve Pills are 50c. a box. For sale by all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

bones. I wondered if this was the way so many old people died of apoplexy. But even through my blazing anger, I knew I had no intention of seeking my safe place beside Edward with the story on my lips that I had passed out in a fit of apoplectic anger with his grandson. And the mist before my eyes swam and cleared. And there stood Edward, the curls damper than ever on his forehead, his big eyes the deepest wells of misery I haev ever seen. Slowly the clenched look about his jaws relaxed, and his lips curled up, for all the world as I remembered them years ago when we disagreed about the cooky jar. And I gathered him close against me, and hid his face in my lace collar.

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Write for free trial treatment.

BOX 309 WINDSOR, Ontario

How the Udder of a valuable cow was

saved

Chas. K. Robbins, of Cheboyne Point, Yarmouth, N.S., writes:—

"A recent experience in reclaiming what was supposed to be a lost section of a valuable cow's udder has demonstrated again the great worth of Minard's Liniment. I can recommend it in the highest terms to all who have a herd of cows.

"For years I have never considered my household stock complete without a bottle of Minard's. For burns, bruises, sprains, frostbites, or chilblains it excels. And I know of no better remedy for a severe cold.

"I think I am safe in saying that among all the patent medicines there is none that covers as large a field of usefulness as does Minard's Liniment. A real truism—Good for Man and Beast."

MINARD'S "KING OF PAIN" LINIMENT

Yarmouth, N.S. 8

"I just can't stand it, Grandmother. I—I hate him," he said into my collar.

And it was so funny. Whatever else we may not have in our family, we every one have a sense of humor, and this big six-foot boy blubbering invective against his tiny, red, crumpled three months' old son, struck us both form tears into giggles.

And why not? Hadn't we been up all night strained and haggard? Wasn't the baby all right now, but still yelling, his mother hung over his bassinet, unmindful of our hunger and deaf to our human needs?

And it was at that moment that I recevived my inspiration. Edward's question of "how much time can a man spend away from his family and still retain one hundred per cent. of affection" seemed the most logical thing in the world. I did not need to be told another thing, but tae flood gates open, he insisted upon telling me. And I followed him downstairs into the sitting room as he talked. And after talking on and on while I thought of something else, he finished: "And I'm not blaming anybody, but my life has been hell ever since he was born."

And I did not say a word, just patted his shoulders. I had my mind made up what I was going to do, and Edward was too young to know. I remembered now, clear as a bell, how the very same thing had happened when Edward's father was born, my first child. And I fairly chuckled to myself. I had realized the situation after a few months, and one of the very happiest of my married life had followed—every day, every evening of it full of eagerness and romance, until my heart quickened at Edward's step coming up the walk, and stopped almost at the look of wonder love in his eyes. It was all such fun, and such a joke on my dear Edward, for he never knew. It was one of the secrets, I thought, as I patted my grandson's big shoulder, that I could look forward to telling my own Edward when I went to him.

* * *

Her mother had gone home, and there sat Edward's wife beside the baby—white, old looking, her pretty yellow hair stringing about her ears. And there stood the nurse, crisp, starched, capable, and there yelled "him!"

By much persuasion we took Edward's wife—at least Edward's son's mother—away with us. In the sweet warm kitchen, her hand raised involuntarily to open the door I had closed softly behind hed. Then she stopped half way. The quiet came over her eyes like a veil, the meaning of the whole scene seemed to dawn upon her, and she sank down gratefully and ate, and ate.

Goodness knows when she had really eaten before. I raised by eyebrows at Edward and nodded for him to note it. And suddenly he reached across the table and squeezed the hand she held her fork with. She smiled sleepily, and patted him back.

I WAITED a day, so as to be quite rested up, and certain in my mind of what I was going to do. I knew if I went to Edward's wife with one bit of blame for her anywhere in me, she would match it with that much blame for Edward, or his father or mother, or me. It is a very delicate relationship, the second married year. But I knew if I went to her with love that blows like a sweet breeze, I would find her that same.

And Edward's wife understood everything I suggested. She agreed with me that Edward was young, and socially inclined, and pleasuer loving, and nervous of temperament, and more than usually sensitive to noise.

Then, she agreed that what Edward had married was the prettiest girl in the town, the girl with the most beaux, the brightest eyes, the smartest frocks.

Then I pushed her in front of the long mirror in her bedroom door—and let her see what she saw. Her hair never had been curly, though we had all thought so before Edward married her. And her lips had always been colorless though until after Edward married her we had all thought they were like cherries.

Then, as the shadows of evening came, and home coming time for Edward, we began to rustle among tissue papers in bureau drawers, in long-closed fragrant boxes, and over the dressing-table we arranged the "vanity mirror" which she confessed had hung askew for weeks. Then, along at the last, with my old shameless hands I held a rogue stick and a poyder puff while she applied them alternately.

When we were finished, she looked just as she did before Edward married her, curly hair, cherry lips and all. I hugged her myself, and I noticed in the "vanity mirror" how bright my own eyes were, and two red spots on my cheeks. And just then we heard Edward's car at the gate.

The color flung up into her face, as I knew it would, and her smooth, white throat throbbed above her chiffon bodice. "Oh, Grandmother," she questioned eagerly, "shall I get the baby, too?"

And for the first time, the very first time in my life, I was sacreligious; I said "For God's sake, no!"

As she went to the door I whispered: "Whatever you do, don't let on to Edward that you are doing anything particular.." And I pushed her out of the room.

I leaned over the staircase until I heard the staccato of her French heels meet the "plump, plump" of Edward's heavier shes half way down the hall. I could see black arms and white cuffs across her light waist in the back and when I peered into the living room a half-hour later there they were seated on the divan under the shaded lamp.

Oh, oh, I was having such fun with Edward! And I slipped out the back way, and went home.

And that was only the beginning. There were parties and dinners, and excursions of youg married folks to the city. And pretty dresses!

And often my old heart quickened when Edward heard his wife coming down stairs in the evening, and stopped almost at the wonderlove in his eyes.

WHEN CANNING FRUIT

When canning fruit place the jar in a small saucepan with a short strong handle. It can then be held against the edge of the vessel in which the fruit is boiling and will catch any fruit or juice that spills over the jar. It also prevents any risk of burning the hands.

Do Not Neglect The Bad Cold OF TO-DAY

IT MAY BE SERIOUS TO-MORROW

May Develop Into Bronchitis, Pneumonia and perhaps Consumption.

Miss Mary Prouse, R.R. No. 1, Cedardale, Ont,, writes:—"I had the Influenza in November last, and it left me with a terrible cough. I did not attend to it until it got so severe people warned me it was time to see about it. I went to the doctor and got some medicine. He told me it was a bad attack of bronchitis. I could not sleep, and would have to sit up nearly all night, it was so difficult for me to get my breath. The doctor's medicine did not seem to be helping me the least bit.

One of our neighbors came in one day, and told me about Dr. Wood's Norway Pine Syrup. I tried it and took two bottles. No person could believe how it helped me. I have recommended it to different people since, for I believe I have reasons for doing so.

Dr. Wood's Norway Pine Syrup has been on the market for the past 30 years, and stands out by itself as a remedy for all coughs and colds.

Be sure and get the real "Dr. Wood's" when you ask for it. Put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

AH, THESE WOMEN!

"A pretty how do you do, I should say. Just when things began to run in fairly decent shape, the country turns itself upside down, all for nothing."

Why Samuel, what on earth has come over you all of a sudden, and it on the Lord's Day, too? I don't think it did you much good to go to hear the "new minister" from the spirit you bring home, you might as well have stayed at home with me.

I guess it won't make much odds where I am or any of the rest of the men either, if the "new minister" stays here.

Why Samuel, how you talk. I hear he is just a wonder. Only yesterday one of the ladies told me she did hope he would settle here, he seemed so interested in all the folk in the community. I'm sorry I can't get out more.

It's too bad, I'm sure, that there wasn't something to keep the women on the road. I expect the most of them will be in "overalls" and the men in aprons, soon.

Now Sammie, dear—be sweet and do tell me about it, won't you? It's so awfully one sided, this way of talking.

I guess there'll be sides enough soon, perhaps too many. Why, Matilda, just as if the men couldn't run things. Who ever heard of the like, "Women Voting" and holding meetings, and the new minister upholding it too.

What was his text.

Oh, text, I don't remember—something about thinking alike, or being of one mind or some such thing, but when he got started it was—Cooperation—"Cooperation". If the text had been sick with the "small-pox" the sermon never would have caught it, for all he talked about was women and girls voting and forming some organizations, and holding meetings, and—why Matilda, you'd be shocked or then your not Sam Murphies wife.

Why Sammie dear, crooned Mrs. Murphy. "What a splendid thing that would be. It would be such a variety for we women folk, it does get kind of dreary just working in a kitchen year after year, with nothing to think of but hard work.

Now, what on earth does a woman know about voting or farming either. Good gracious wife, it's all foolishness and worse.

And why should a woman know nothing about voting, I wonder?

How would she? Sure, she never goes to a political meeting or reads the papers. Whoever heard of two or three women even talking about the laws of the country, or elections, or farming, or anything of the sort. To my mind a woman's place is in the house.

Why Samuel, you'd be simply furious if I told you that a man's place was in the "barn", yet it would be just as reasonable as to say my place is in the house. If you can do your barn work in good shape and go to a political meeting, why can't I do my house work and go with you, or why can't you stay with the twins and let me go. I wish you'd consent to let me go to church next Sunday, for you have really aroused my curiosity. Now, that would be learning to co-operate, and you really cannot imagine how you'd enjoy our sweet twin boys, so promise me, and now let us forget about it today—and when tomorrow comes I'll tell you whether I have ever thought about politics or not, and maybe you won't think that all women are asleep.

Say, Matilda, look coming down the lane—that's the parson, I vow, and here it is Tuesday and that agent coming with my seeder. How in hatch can I waste time to sit down in the house.

Why, Sammie dear, you just take the time, same as I did when Jean Miles came for me to fit her dress. Sure, I had to let her wait, for you insisted upon me dropping all that fodder corn before it rained. Now be good, he won't stay—and perhaps the agent may be miles and miles away.

Afer an hour of pleasant visiting, Rev. J. P. Smith went on his way, and the Murphies resume their Sunday attitude, with the exception of a few points in favor of Mrs. Murphies' argument.

Why Sam, it's just great, he thinks that it is the duty of all farmers wives to organize into clubs and study and help—to make the lives of the country people especially, more pleasant and more worth the while.

Well wife, where is there one woman who would know how to vote, even if she did study.

Why, Samuel, all women have minds of their own.

Yes, I guess that's so all right, and most of them couldn't be jarred with a cannon.

You have just guessed right, and to my mind, when women begin to vote they won't at least let a $5.00 note change their minds, as many men do, and that is half the reason that we have had so much wrong voting—so many men who are ready to say "What odds is it who I vote for, it don't effect me. Whoever or whatever party gives me the most money, that's the side I'll go on." Now, I can safely vouche for the majority of women, that no candidate, no matter how flattering, will be able to induce them to vote against their conscience, and that they will strive to learn which really is the side of politics that will do most toward making the country better. I rather like the new minister's view of the matter, and like Martha Jones, hope he may move his family here.

There comes the agent with my seeder, Matilda.

Thank goodness for that. Now I can give the time I use every year in gardening (without any credit for it) in meeting with other men's wives, and in studying the best and wisest ways to assist my husband in his work, both by learning the right way to vote and by voting that way. Not because someone else voted that way, but because I fully believe it to be the clean and right way. Men have voted since the world began, and are today displeased with many results. Better allow the women at least a few years to Cooperate, perhaps we may ask at least a trial of 25 years, which will be only a drop in the bucket compared with the time you men have been voting, and I fancy I hear you say: Well wife, I guess the old world would be pretty blue without the women, and I think it would be equally blue without the men—so much will we find in true Cooperation.

FARM WOMAN, N. B.

Poisoned By Gas While In a Well

FRANK CARLSON FOUND RELIEF IN DODD'S KIDNEY PILLS

Saskatchewan Man Who Suffered All Summer Claims That His New Lease of Health is Due to Dodd's Kidney Pills.

Livelong, Sask., June 22nd. (Special.)—Most enthusiastic about the benefit he has received from using Dodd's Kidney Pills is Mr. Frank Carlson, a well known and highly respected resident of this place.

"I was gassed in a well on my farm 25 feet deep," Mr. Carlson says. "I was nearly dead. I was treated for a whole summer for my trouble, but did not get better.

"Then I read in a little almanac about Dodd's Kidney Pills. I had no idea they might benefit me, but was willing to try anything. To my surprise the improvement in my general health was so great, and my kidneys were so much better, that I feel like advising everybody to use Dodd's Kidney Pills. I would not be without them."

Dodd's Kidney Pills are a kidney remedy. They strengthen the kidneys and enable them to do their full work of straining the impurities out of the blood.

Ask your neighbors if Dodd's Kidney Pills are not the sovereign remedy for sick kidneys.

SHORT COURSES IN HOUSEHOLD SCIENCE

FOR "TEEN AGE" GIRLS

JULY 6-16, 1920

TUITION FREE

Practical instruction in Cookery and Canning. Students will lodge in private homes and will prepare and serve their meals at the College, under the supervision of instructors.

Recreation entertainment will be provided, including sing-songs, Folk dancing and Tennis. Only a limited number of Students can be accommodated.

So make application IMMEDIATELY to

MISS HELEN J. MACDOUGALL,
Superintendent Women's Institute,
Agricultural College,
Truro, N. S.

RAW FRUIT DESSERTS

The tart rhubarb appears just at that season when the appetite craves a change. Rhubrb is an excellent spring tonic. It comes from a plant which is closely allied to dock and sorrel. In its native soil, the central regions of Asia, it attains a wonderful growth, developing stalks six or eight feet high. From the roots of this variety are prepared many of our most valuable drugs.

Rhubarb appears very early in the market. The dwarf varieties are the more tender. Stalks grown in hothouses are not tough and stringy, as sometimes is the case with rhubarb grown in gardens.

Rhurbarb possesses the faculty of harmonizing with other fruits in any

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me today for free trial treatment.

A MESSAGE TO WOMEN!!

Mrs. M. Summers, Box 09 Windsor, Ont.

combination. The acid juice congeals readily in making rhubarb jelly; and n combn: tion with peach, orange, quince, strawberry and currant juices it assists these latter to jelly without changing their flavors. The juice of the rhubarb can be brought to the boiling point, sealed and put away to use in combination with the latter fruits, not yet in season.

Molded Rice and Rhubarb

20 medium-sized stalks green rhubarb.
1 quart water.
1½ cupfuls light brown sugar.
1 cupful rice.

Cut rhubarb in smal pieces and boil nutil soft Remove from fire and drain as dry as possible; mash and add brown sugar. Boil rice until soft in water. Mix rhubarb and rice, beating thoroughly. Mold in slightly buttered cups and place on ice until cold. Take from olds just before serving and serve with hard sauce.

Rhubarb with Raisins

2 pints rhubarb cut in inch pieces.
1 cupful raisins.
¾ cupful sugar.

Put ruhbarb in a saucepan over a fire until the juice runs freely. Do not let it at any time boil hard. Add the raisins and let this boil until the rhubarb is nearly reduced to a pulp; then add sugar. Boil up, remove from fire, and put aside to cool. Serve cold with cream.

Rrubarb and Banana Dessert

..1 pound rhubarb.
1 cupful sugar.
1½ tablespoonful gelatin.

Steam the rhubarb, which has been cut in pieces, with the sugar and one-half culpful water; when thoroughly cooked add gelatin which has been soaked in onefourth cupful cold water for half an hour.

1 cupful banana pulp.
Juice of half a lemon.
½ cupful orange juice.
½ cupful sugar.
1½ tablespoonfuls gelatin.
1 cupful whipped cream.

To the banana pulp add lemon and orange juice, sugar and gelatin soaked in cold water, as above directed. When begining to set, fold in the whipped cream. Put a layer of the rhubarb jelly in a mold, then a layer of the banana cream, alternating until the mold is filled. Place in the ice box to harden. When ready to serve, unmold and garnish with whipped cream flavored with banana.

Cherry Cup

Seed one quart of sweet cnerries. Put one pineapple through the food chopper. Combine the fruits with one-half cupful sugar, and chill. When ready to serve, pour over the fruit one-fourth cupful lemon juice and one-half cupful orange juice mixl ed with one-half cupful sugar. Serve in small glasses. Walnut meats and marshmallows may be added; or cream, sweetened and whipped until stiff, may be heaped on top.

A Dainty Strawberry Dessert

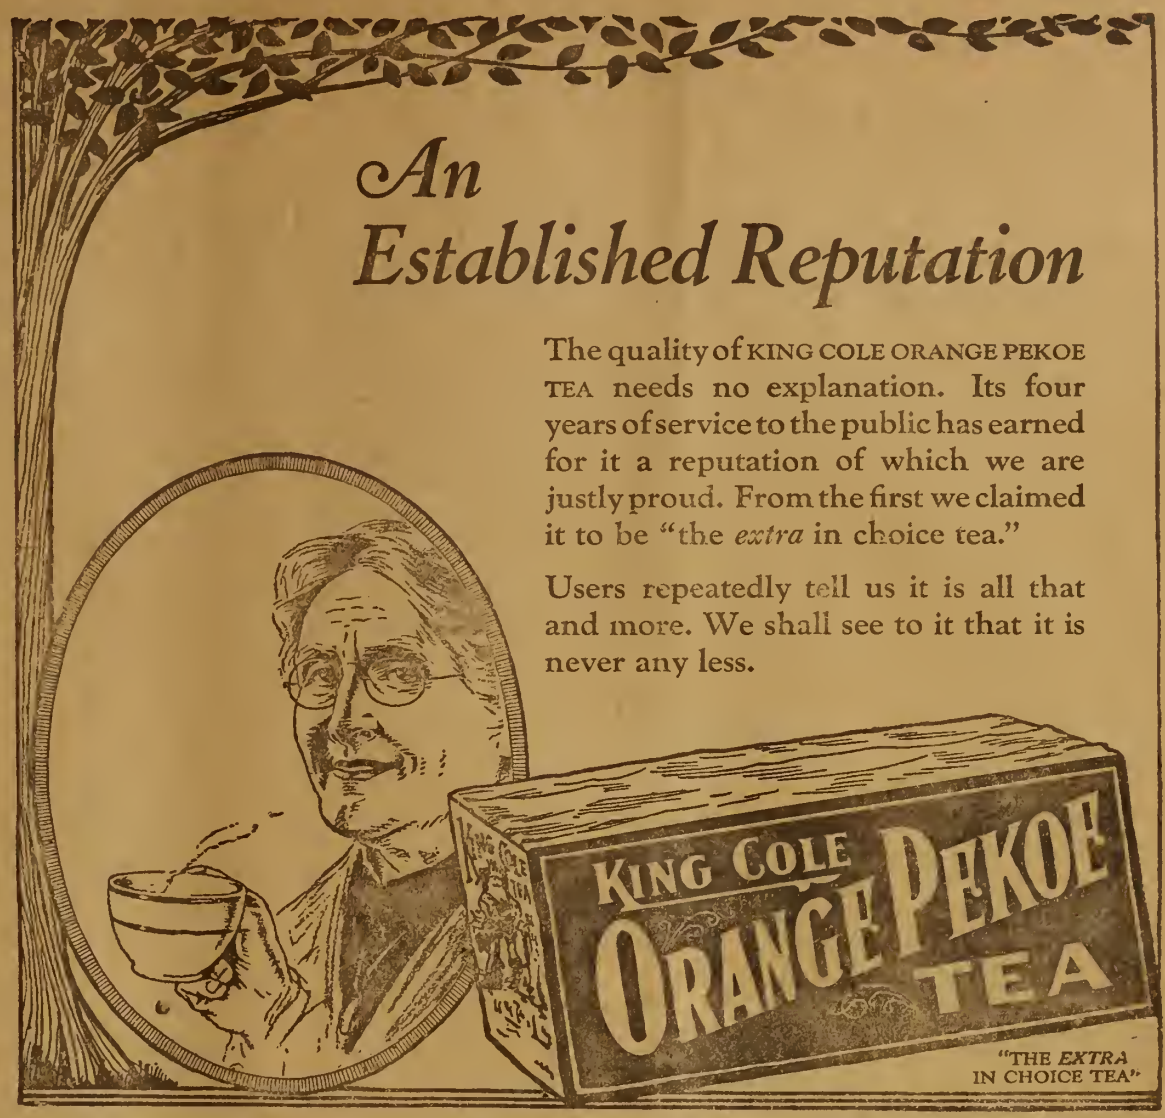
1 cupful ripe strawberries.
1 cupful sugar.
2 egg whites.
Stale cake.

Mash the berries and stir in the sugar. Beat the whites of the eggs stiff; then put in the berries and sugar and whip stiff. Put a layer of stale cake in the bottom ot a dish and pour the strawberry fluff over it. In about an hour the cake will be permeated and softened with the juices while the fluff on top is firmer than before. If you desire to make the dish more ornamental, drop spoonfuls of whipped cream on the meringue, putting a strawberry and a bit of green angelica or real strawberry leaves on each.

Strawberry Blanc Mange

1 quart milk.
¼ cupful sugar.
1 cupful strawberry juice.
4 tablespoonfuls cornstarch.

Heat milk to boiling poit; add sugar, strawberry juice, and cornstarch which as been rubbed smooth in a little cold milk. Cook until thick, and pour into wet molds. When firm turn out and garnish with whole strawberries and serve with sweetened whipped cream.



An
Established Reputation
The quality of KING COLE ORANGE PEKOE TEA needs no explanation. Its four years of service to the public has earned for it a reputation of which we are justly proud. From the first we claimed it to be "the extra in choice tea."
Users repeatedly tell us it is all that and more. We shall see to it that it is never any less.
KING COLE
ORANGE PEKOE
TEA
"THE EXTRA IN CHOICE TEA"

At the Yarmouth Y. M. C. A. Boys' Camp, held at Tusket Falls in August, I found MINARD'S LINIMENT most beneficial for sun burn, an immediate relief for colic and toothache.

ALFRED STOKES,
General Secretary.

A GOOD FARM ICE BOX

Have the tinscmith make from galvanized iron a box six feet long, two feet wide, and two feet deep, inserting a half-inch drain pipe at one end. Set this on the back porch, where it can be shaded. Build about this a larger box, leaving a space of six inches between the inner and the outer box. Generously support the bottom so that the weight of the ice will not cause the inner box to sag. Fill the space between the two boxes with sawdust or chopped hay or straw. Put on a close-fitting double cover; put the ice in one end, leaving the other end for comodities to be kept cool. Such a box will hold 500 pounds at one filling and will not require filling oftener than once a week. This box is a good ice-saver, as it opens on top. Every time the bottom door of arefrigerator is opened all the cold air inside rushes out, because cold air is heavier than warm air. To recool the warm air that enters takes ice, besides keeping the contents of the refrigerator subject to changing temperatures. The box avoids this trouble. Put a trap in the drain.

A CEMENT FOR FLOOR CRACKS

Dust and dirt are prolific sources of disease. Cracks in floors, while being unslightly in appearance, harbor an unbelievable quantity of dirt.

A new floor, if properly laid, is free from this disagreeable feature, but in the course of time, these cracks will begin to appear, due to the shrinkage of the wood. For this identical condition paint manufacturers make and sell a specialty known as "crack filler." If all floor cracks are filled with this material the accumulation of dust and dirt will not be in evidence. Thus you may be assured of a sanitary floor surface and sickness may be avoided.

It is a simple matter to remedy; just clean out the dust from the cracks with some sharp pointed instrument and then thoroughly clean out with a scrubbing brush, soap and water. When dry, the crack filler may be applied. It is made in stiff paste form and should be applied with a putty knife in much the same manner as putty. To make the job complete the floor should then be waxed, varnished or painted, depending, of course, on the present finish and the effect desired.

KILL THE EARLY FLIES

One female fly surviving the winter may have the following progeny:

April 10, ...	1
April 29	10
May 20	200
June 11	4,000
June 30	80,000
July 18	1,600,000
August 5	32,000,000
August 25	640,000,000
September 16 ..	7,600,000,000

Swat 'em early and save yourself later trouble.

A HOME MADE SOAP SHAKER

An excellent soap-shakor can be made by perforating the lid of a baking-powder tin, making about twelve holes in the lid. This I find is a good way of getting rid of scraps of soap that are too small to handle.

TO TIGHTEN THE SPRING IN SHADES

When the spring in your shade becomes loosened, wind it up by using an ordinary button-hook. This will save many sore fingers.

DISH DRAINER AND RINSER

Buy ordinary baking-pan of any desired size and in the bottom about one-half inch from the end make, with a nail, a row of holes. Let this end of the pan extend over the drain board over the sink. Use pan for scalding and draining dishes.

TO SPRINKLE CLOTHES

When sprinkling clothes use a whisk-broom. It is easier and quicker than doing it by hand, and also distributes the water evenly without wetting the clothes too much.

CHIFFIN OR GEORGETTE CREPE

If when sewing thin materials, such as chiffon and Georgette crepe, you will slip a strip of paper under the seam to be sewn, it will stitch perfectly and not draw or pucker in the least. The paper can be torn off when the seam is finished.

COST OF PRODUCING MILK

(Continued from page 712)

price of butter, but is it high when the average price of milk at one of the best paying creameries in the Eastern Townships was $2.54 for the year 1919. By allowing a generous value of $0.79 per hundred for the skim milk which is returned to the farmers and which must be added to the above amount, we have a gross return of $3.24 per hundred weight for the Eastern Townships dairyman, which is less than any of the figures given above for the cost of producing milk under present day conditions.

Te question is often raised by people who have not studied this question. "If the average dairyman is not making any profit, how is he able to live and in some cases lay up a little money?" He lives by marketing his hay and other produce (in the form of milk) at a price lower than the prtvailing market price, and by accepting a less than legal rate of interest on the capital which he has invested; he lives, if he prospers at all, by strict frugality which is usually considered penuriousness; he lives by working 12, 14 and 16 hours a day, while the above estimates are based on a ten hour day; and he lives by the unpaid labor of his wife, his boys and girls, and perhaps by his aged father.

Another argument used against the milk producer often is in regard to the purchased feeds which is cows consume. "Why not raise these on his farm?" they say. Yes, and enough for hogs too! It is perfectly true that some farmers might raise more produce than they are doing, for we are not defending slackers, but any who is in the business himself and in touch with other dairymen knows that most farmers are raising al lthey possibly can with the capital and help at their command and the too often unfavorable weather conditions under which they have to contend. If we kept only as many cows and pigs as could be fed entirely off the farm most of us would be obliged to reduce our dairies by a third and our swine by at least one half. Think what this would mean on the output of our eastern farms, especially now when we are told that the country must be saved by greater production. Then again, it is poor farming to sell milk and meat aff the land continuously without replacing the plant food which is thereby carried away. The cheapest and best way to replace this plant food, in most cases, is for the eastern farmer to buy western grain or grain products and feed it ou to live stock even if he can do no more than get his money back by the transaction.

The statement is often made, and no doubt it is too true, that thousands of children in our cities are ill-nourished from the lack of good milk. This is a sad and terrible thing to contemplate; but should the producers of milk be shouldered with the responsibility of these little lives, as it too often is the case? If, as we have shown, the average dairyman is producing at a loss, what incentive is there for him to produce more and better milk ? I have no excuse for the filthy producer, but at the same time the public should know that it takes more time and labor, as well as a better equipment, to produce clean milk in winter than to produce dirty milk. More bedding must be used, the stables cleaned more frequently and more thoroughly, cows must be groomed more often, the udders washed at times, and the attendants and the utensils kept in a sanitary condition. All this means work and expense and the public is not willing to pay for it. If the wasteful systems of distribution in vogue in most towns and cities could be drastically improved, a saving in price of milk to the consumer could be effected; but if the consumer tries to effect a saving by reducing the price to the producer. (conditions remaining as they are) there will be a lessened production, which must of necessity raise prices. Milk at fifteen cents per quart or cheese at thirty cents per pound are cheaper foods than eggs and meats at prevailing prices.

I would like to close this discussion of the milk question with a quotation from an address by Mr. John J. Dillon before a meeting of consumers organized in New York city to strike against the price of milk. This was in November 1919, and the address published in the Rural New-Yorker.

"Your first concern is the production of a full supply of milk. It must come from the farms. You can get it nowhere else. The production of milk is the most slavish occupation and the most hazardous business in the world. The heavy work of the dairy goes on in rain or shine, hot or cold, Sunday and Monday, from before daylight until after dark. There is no 44 hour week for the dairyman. The day is never long enough for him. Father and son, and oftentimes the wife and daughter, take their part in the work.

"It takes three years to raise a milch cow. Four to five years is her average time of production. In the meantime any one of a score or more of accidents may befall her and disqualify her for production.

"Frost or storm, heat or cold, drouth or floods, blight or insects may destroy the prudent provisions made to feed her. The milk producer takes all the chances, assumes all the hazard.

"I would not have you value this simple, honest toil too lightly. Here in this great city you grow proud of your wealth, and your streets, and your buildings, and your flourishing business and prosperous institutions. Some of pou may not hold in much esteem the simple life and modest institutions of the country; but let the farmers take one Sunday off and practically every breakfast table in the city would be disturbed on Monday morning. If they took a month's vacation we would have famine in the city. Let them stay six months and moss would accumulate on the marble steps of pour counting houses and grass would grow in your city streets."—C. S. Moore.

THEY ALL DO IT.

In our little town—ah, sad to tell:—
There's a merchant who desn't know how to sell,
A laywer who doesn't know much of law,
A sawyer who doesn't know how to saw,
A teacher who doesn't know how to teach,
A preacher who desn't know how to preach,
A painter who can't paint very well,
A printer who doesn't know how to spell,
An odd-jobs man with never a job,
A cobbler who doesn't know how to cob,
A miller who doesn't konw how to mill,
A butcher who doesnt' know how to kill,
A racer who doesn't know how to race,
A mason who doesn't know how to mace,
A clocksmiit h who cannot mend a clock,
And a doctor who doesn't know how to doc:
And since none of them are busy men
You'll find them, again and yet again,
Ever, anon and a few times more
Round the stove in Mendelsshon's store,
Each talking freely and through his hat—
Doing the one thing they're expert at—
Giving advice to the farmers.

—LEE SHIPPEY.

Champion "X"
A-15, ½-inch
Price, 90c.
Adopted by the Ford Motor Co. as standard equipment on Ford cars since 1911.

Champion

DependableSparkPlugs is Ford's selection and should be yours

Nearly half the cars in Canada are Fords. Each one left the factory equipped with Champion "X" plugs.

The significance of this fact, and the proved efficiency of Ford cars, speak volumes to spark plug users in making replacements in Ford cars and those of other makes or in trucks, tractors, farm engines, motor-boats, or motor-cycles.

Service dependability is built into our "3450" insulator, which takes, without breaking,. punishment and abuse that has been considered impossible in anything but metal.

"Champion" on each insulator is your guide to the world's best spark plug.

BUTTER FROM NEUTRALIZED CREAM

The following letter was received the other day, and as similar questions regarding neutralized cream have reached us from other localities we treat the matter in detail.

"Dear Sir:

I have read in the Journal of Agriculture, an article concerning the neutralized cream. I would be very anxious to get some explanation about it. Do you think, with the gathered cream, n cidity 45 or 50%, a buttermaker can neutralize it without pasteruizing it because here I have no pasteurizer? Neutralize cream to be churmned two or three hours after, is it possible to obtain good process?"

The first point for our readers to

remember is that neutralization of the gathered cream does not take away anw of the undesirable bacteria which have accumulated, and which will give the cream and the butter a bad flavor and spoil the keeping quality. The only way to improve the cream and procure a well keeping buter is by means of pasteruization. Efficient pasteruization of sour cream is an impossibility, and the sour cream must be neutralized first before it can be pasteurized. Further, the neutralization of sour cream with caustic soda dissovles some of the casein, and the dissolved casein is easily removed in the butter milk leaving a purer butterfat, and, in consequence, a better butter. The majority of bad flavors develop in the casein found in the butter.

A further question asked in the letter was:

"A cream vat contains 1800 lbs. of cream testing 30%, acidity 46. How much caustic soda should be added to reduce acidity to 32-35?"

The answer to this question would be very simple if we could be certain that pure caustic soda was to be used.

However, 1800 lbs. of cream of 46 acidity contain 18 x 0.46 lbs. acid and 1800 lbs. of cream of 32 acidity contains 18 x 0.32 lbs. of acid. The difference between the two is the acidity to be removed, namely, 18 x 0.14 lbs. of acid=2.52 lbs. of acid. One lb. of caustic soda neutralizes approximately 2 lbs. of acid. This, for 2.52 lbs. of acid, 1.26 lbs. of caustic soda should be added in a very diluted solution, by adding 25 lbs. of water to the soda.

The buttermilk from this neutralized cream looks watery and transparent. It is, a good hog feed though not suitable for human consumption.

Before finishing we want to emphasize again that butter made from neutralized cream, will spoil very rapidly. Further, we cannot imagine a creamery without some kind of a pasteurizer. The inquirer stated that he could not afford a pasteurizer. We cannot see how a man can afford to make butter wtihout one, as it makes a keeping butter that will demand a good price in any market. As soon as a butter market becomes weak the low grade butter suffers most, first quality very little, and extras not at all. Therefore we think it a good policy to make only extras and be independent of market fluctuations.

NATIONAL DAIRY COUNCIL OF CANADA

This Council has saved the milk producers of Canada hundreds of thousands of dollars in preventing shipping rates on milk and cream from being increased.

It wants to educate the consuming Public to appreciate the food and the economic value of milk and its products, so that they will use more of them and increase the home market.

The Council asks every dairy farmer in Canada to help it by giving 50 cents towards its founds.

With the patron's consent this 50 cents will be deducted from his June or July payment by the Concern to which he ships his milk or cream, and will be sent by that Concern to the Council.

All dairymen should help to protect and promote the great dairy interests of Canada.

E. H. Stonehouse, President, Weston, Ontario.
D'Arcy Scott, Sec. Treas. Ottawa, Ont.

One way by which the hard-worked dairyman may continue business and yet curtail his work is to weed out the poor cows from his herd. With the high cost of production of milk no "star-boarders" should be permitted to remain in his stable.

A farmer in the States calls the scrub bull bulshevik.

Stop Wasting Gasoline

SOME persons think that what they do with their money or what they purchase with their money is not any other person's business.

They are mistaken.

A lot of people are buying gasoline to-day and using it wastefully. In so doing they are penalizing all the people.

Those who have studied the subject say that one-half gallon of gasoline per car is wasted a day through carelessness, through over-use of cars and useless mileage. This means 200,000 gallons wasted a day or 7,300,000 gallons per year.

This has to be stopped or the price of gasoline will prevent the use of thousands of cars. Anyone who wastes gasoline is doing an injury to you whether you own a car or do not own one.

There are about 400,000 motor cars and trucks in Canada. The motor car is a great utility. It gives opportunity to many thousands of people—men, women and children—to get out into the country, to have recreation and pleasure that otherwise would be difficult for them to obtain. It is a great agency in the promotion of good roads. It is a great agency, too, in the promotion of good health. Anything that restricts its use is of public concern.

Does the waste of gasoline concern the person who does not own a car, might be asked. Let us see.

THERE are thousands of motor trucks. They do a great work in the transportation of various commodities. If the price of gasoline advances the cost of transporting goods will be increased. You will have to pay it in the higher prices you pay for meat, for vegetables, for milk, for eggs, for moving your household goods, for anything and everything you eat or use. Directly or indirectly it will be in the bill the general public has to pay.

One gallon of gasoline will provide the energy to move a one ton truck 15 miles, or, to put it another way, it will move 15 tons of freight one mile. If the users of automobiles would save the one-half gallon they now waste each day it would equal 109,500,000 ton miles of haulage.

It is estimated that more than 30,000 tractors will be used this year in Canada. All of these require gasoline or other refined oil fuel. Without these tractors, Canada could not plant her crops, let alone harvest and thresh them.

It has been figured that the 7,300,000 gallons of gasoline wasted per year in Canada is sufficient to plant, harvest and thresh 15,500,000 bushels of wheat. Think what it would mean to you, to Canada, and to the world if the production of Canada's food crops were curtailed.

There IS a shortage of gasoline. In the last few years the demand for crude petroleum, practically all of which must be imported for the manufacture of gasoline in Canada, has increased more than 650 per cent. In a like period, production has increased only 150 per cent. A shortage of crude and high prices necessarily follow. Pennsylvania crude is to-day costing $6.10 and Oklahoma crude $3.60 per barrel at the wells, and these prices must be paid in American funds which adds another 10 per cent. These things render gasoline scarce and make it very high in cost.

Economy in gasoline means more than the general public appreciates. More gasoline is being used to-day than is being produced. That means that reserve stocks are being drawn upon. Curtailment of waste is imperative. It rests with users of gasoline to do voluntarily what otherwise they inevitably will be forced to do.

Save Gasoline.

IMPERIAL OIL LIMITED

PROFITEERING FROM THE ALREADY OVERWORKED FARMERS

(Continued from page 703)

to start a store and to the farmers of Victoria Mills combining. Well, if the farmers of that section, who have been buying their flour and feed, just as cheap as the Woodstock store can buy them, desire to pay more for these goods, then they had better start the store. If they think they can compete sucessfully, not with their local stores, but with departmental stores, doing a nation-wide business, that will be the business of the men who put their money into the proposition. All that the Maritime Farmer wishes to observe is that the United Farmer stores have been long on promises. It is pretty nearly time they came over with some of the long-talked of benefits. The farmers of New Brunswick have already proved that they, uneducated in the fine art of buying and selling as they are, can buy and sell cheaper, in some lines at least, than these concerns in which they are invited to invest their money.

But the whole organization, as conducted from Winnipeg, is one in which money figures largely. First the farmer pays his membership fee, which is very proper. Then he subscribes for stock in stores, which tell him on one hand he is to save money, and abuse him on the other because he will not waste money. Then there is the Guide, for which he is asked to subscribe ($1.50 per year, if possible, if not at 25 cents for four months); then there is the foundation fund, a new one designed to raise funds for organization purposes. And when the organization is completed, it will be Winnipeg that will benefit, not the Maritime Provinces. Not only have these various assessments been made, but the United Fruit Growers and the United Farmers were induced to put money into a paper, which is controlled in Winnipeg. So that no opportunity is missed to give the farmer a chance to contribute.

As this organization is being designed for the benefit of Winnipeg, it would seem to the Maritime Farmer, that the Grain Growers' Association might readily spare some of that 500 per cent, profit, to carry on the organization. Surely out of the three and a half million of surplus, there should be enough money to go around without asking the farmer at every turn to pay. Why not use the money, now that it has been made?

But a greater contribution is being advocated. The Canadian Council of Agriculture is asking for the control of wheat by the Canadian Government. That will mean that the west will get the last cent out of wheat. But did you notice this? The United Farmers' Guide had an editorial in its issue of June 9th, top of page five, right hand outside column, in which it drew attention to the delights of the decontrol of feed prices. And the farmer of the Maritime Provinces is reminded that when this protection is removed he will have the privilege of paying eighty dollars per ton for bran. The Guide is surely doing the work which Winnipeg asks for.

What farmer is there in the Maritime Provinces who is asking the right to pay eighty dollars per ton for bran? Where does the Guide stand on the question? We are for all the control that can be given if the west is to get government handled wheat. If they do, then we in the Maritime Provinces, should not stand for eigthy dollar bran. .Just so surely as this article is being written, just so surely will the farmers of these provinces, realize the service the Maritime Farmer is performing, when they get their feed bills this year. The United Farmers' Guide, when it proposes the decontrol of feed prices and eighty dollar bran speaks for nobody but itself and its Winnipeg owners.

May we again say and without apologies, that we are for the Maritime Provinces, and we are against farmers paying one cent more than they have to for any commodity, whether it be flour or bran.

In a word, we hate hypocrisy. We want a straight deal. We do not like 500 per cent. profits, three and a half million surpluses in co-operative companies, nor do we like to see farmers lectured because they are expected to pay unnecessary prices for goods. If every merchant in this province is expected to charge as much as the United Farmers at Woodstock, then the farm population of this province is in for a roasting. We think our farmers are too sensible to take either the Guide or those who would soak them, very seriously.

GLEANINGS OF AGRICULTURAL PROGRESS IN N. B.

(Continued from page 706)

seed with the Government-owned huller, say that this crop is a money maker. It is hoped that the competition will be the means of extending the culture and use of Red and Alsike Clover on New Brunswick farms. The following is the proposed score card for the standing crop. Look it over and if you have a field of sufficient area make your entry and our inspector will pay you a call. The entry fee is twenty-five cents.

The prizes will be as follows:—

1st	$30.00	6th	$19.00
2nd	27.00	7th	17.00
3rd	25.00	8th	15.00
4th	23.00	9th	13.00
5th	21.00	10th	10.00

SCORE CARD FOR RED CLOVER

General Appearance:—	
(1) Uniformity of crop; absence of blank spots and thin places	7
(2) Vigor of growth, profusion of blossoms, acreage, etc.	8
Freedom from Weeds	25
Comments on same:	
Freedom from rust blights and insects	15
Freedom from other cultivated plants	
Timothy, alsike, white clover, etc.	10
Apparent yield and quality of seed:	
(1) Number and size of seeds per head	15
(2) Uniformity of maturity and color of seed	20
TOTAL	100

EGG LAYING CONTEST FOR NEW BRUNSWICK

An egg-laying contest for New Brunswick has been authorized by the Director of the Dominion Experimental Farms. New Brunswick is the only province with no such contest, either Dominion or Provincial, at present, but the record of her breeders pens in contests held in other provinces show they have high producing stock, which should make the contest a most successful one.

Sixteen entries have already been received. Contest beins November 1st, 1920. Further particulars will be published later.

RE-QUEENING THE APIARY

(Experimental Farms Note)

The extent to which attention is paid to the frequently necessary operation of re-queening is a good measure of the efficiency of the management of an apiary.

We find for instance, in the neglected apiary, that no attempt at re-queening is made and the colony or swarm that chances to lose its queen —an accident which frequently happens to colonies that have swarmed or to after-swarms— is simply left to die out.

Then there is the fairly well kept apiary in which the absence of eggs in a colony after the young queen should have started laying is recognized as an indication that she has been lost and a frame of brood in all stages is given to the colony in order that it may raise a queen, which frequently does not begin to lay until the colony is much reduced in population.

Finally we have the well managed apiary in which the colonies are examined at regular intervals, and worker brood in all stages in patches of full size for the season is looked for. If this, or a young virgin queen is not present, or if the brood consists wholly or largely of drones, known by the strongly convex cappings of the pupae, a fertile queen is supplied at once from the nucleus kept for the purpose, or a ripe-queen cell is given. The best beekeepers go further and follow a regular system of re-queening each colony yearly, thus replacing all, except perhaps the best one-year-old queens. The young queens are more prolific and profitable not only in the fall but also in the spring and are less likely to swarm than the older queens.

The best time to raise queens in Canada is during the clover honey flow. Do not delay until the flow is declining when robbing is easily induced.

A simple and good way for the beginner to obtain fertile queens is to save the queen-cells in a colony that has thrown a prime swarm. Five or six days after the swarm has left, the colony should be divided into nuclei, each consisting of a comb or two of brood containing a queen cell or two and honey with the adhering bees.

A frequent object in re-queening is to change the race of the colony from black bees to Italians, which resist European foul-brood better, and are generally more prolific and better foragers in the interior of Canada where the summers are warm. In purchasing Italian queens, untested fertile queens should be specified. They are

Something New

The Remington UMC

8 Shot, .380 Automatic Pistol

It is exactly the pistol you would expect from the organization that for over 100 years has built up the quality and reputation of Remington rifles and shotguns.

Especially designed for quick straight shooting—it fits your hand correctly. Thumb operated safety lever adds safety when pistol is laid away or carried. Also acts as indicator, it and grip safety both showing whether or not hammer is cocked.

Safety sear lock absolutely prevents firing if a cartridge is left in chamber when magazine is removed for cleaning. No shell head blowouts or breech escape of gases. Each time trigger is pulled fires one shot, automaticcal ejects empty shell and reloads, ready to fire. Especially accurate and powerful.

Made only in one calibre, one style, one finish.

See it for yourself and you will agree that the Remington .380 Automatic is the best pistol for the woods, for touring or for any kind of protection.

Remington UMC of Canada Limited
WINDSOR, ONT.

REMINGTON UMC

less liable to be injured in the mails than tested queens.

A good way to introduce a queen to a colony is in the "Miller" cage. The queen is imprisoned by a plug of soft candy which the bees eat away in the course of a few hours, and in so doing liberate the queen. Of course, one should make quite sure that the colony to which the queen is introduced is without a queen, and it is advisable to introduce her to a colony from which the queen has been removed the previous day.—F. W. L. Sladen, Apiarist.

SHORT COURSE FOR 'TEEN AGE GIRLS

Arrangements have been completed for a Short Course in Home Economics under the direction of Miss Macdougall, Superintendent of Women's Institutes. The dates are July 6—16. The course will include training in food values and balanced menus, actual cooking practice, canning, etc.

There is room for only twenty applicants, and there are some names already in. The girls will be under the care of the Superintendent and teachers during their stay in Truro. Meals will be served at the College, and rooms secured in the neighbourhood. The cost will thus be less than for straight board. Application should be made at once to Miss Macdougall, Agricultural College, Truro, N. S.

AYRSHIRE MEETING IN THE UNITED STATES

Optimism and progression was the key note at the 24th annual meeting of the Ayrshire Breeders' Association of the United States, held at Kimbal Hotel, Springfield, Mass., on June 9th. The meeting was largely attended, breeders being present from almost every state in the union. The large number of new and young breeders present was marked. This new blood coming into the Association is bringing renewed life to the organization. The genial President, W. P. Schanck, of Avon, N. Y., presided. He advised the breeders not to lose sight of breed and hardiness of constitution. That has every kept the Ayrshire in the fore front of the advancing ranks of the pure bred dairy cattle that are to exterminate the scrub. The President also referred to the dairy economic conditions which were forcing dairymen to recognize the importance of keeping only high producing cows, and also recognizing the value of the pure bred bull in imprving the coming powers of their herds. He approved of the move to abolish the scrub bull and also the establishing of accredited herds. He considered that a moral responsibility rested upon the breeders of registered cattle to free their herds, ond also a financial loss to our breeders. He stated that "the more we study tuberculin as a diagnostic agent and its limitations ,the clearer we see the importance of securing animals from herds that repeated annual tests have shown to be clean." He referred to the progress made during the year and thanked the members for their co-operation and bespoke for his successor the hearty support that had been given him.

The report of the executive committee showed that considerable publicity work had been done during the year and that the Ayrshire Quarterly showed a profit of $1537. The report of the indefatigable Secretary, J. G. Watson, showed it to be the greatest year in the history of the Association. The Secretary stated that financially, it was a winner, exceeding the year 1918 in total receipts by $4,928.77. The total receipts for the year 1919 amounted to $43,531 and expenditures amounted to $33,819.35, leaving a net income from operations of $9,711.90.

During the fiscal year, the Association invested $9,997 in Liberty Bonds. which with the addition of a $1,000 Bond purchased in 1918, gives us a splendid sinking fund. We had in addition to this amount, cash in bank and petty cash amounting to $6,391.21. During the fiscal year 4,6333 females were recorded(as agains 6,929 in 1988; 1,515 males, as against 1,565 in the previous year, while transfers showed an increase from 3,312 in 1918 to 4,486 in 1919. The decrease in registrations is accounted for by the change in rates which went into effect in March, 1918, which resulted in heavy registrations at that time to avoid penalty fee. However, if compared with 1917, a normal year, we find a very large increase in 1919. Transfers in 1919 show a 35% increase over that of 1918. During the year, one hundred and seventy-eight new members affiliated with the organization, an increase of almost 6% over the previous year. We now have an active membership of 1,359 and 126 inactive members, a total of 1,495 members. He also stated that volm umes 33 and 34 of the Ayrshire Herd book were issued and volume 35 went to the press which brings their records completes to November 20th, 1919 and shows recorded 59,492 females and 23,650 males. He claimed that their publicity work had been a great stimulus to Ayrshire development. During the year, the Association has been active in fostering sales, assisting at fairs, spreading the gospel of the Ayrshire through the columns of the press, putting buyer and seller in contact, answering correspondence and inquiries, assistig in the organization of clubs, etc., furnishing speakers, judges, etc., and in every way possible boosting the Ayrshire.

The Advanced Registry showed that 66 breeders in 21 states had completed 292 records with a total average of 10,229 lbs. milk and 412.84 lbs. fat wth an averiage test of 4.04% fat. A new record had been made by "Bloomer's Queen," 21,820 lbs. milk and 856.41 lbs. fat. Two world records had been made. In the Roll of Honor 39 certificates had been issued with an average production of 10,128 lbs. milk and 413.87 lbs. fat with an average of 4.09% fat in 300 days.

The fololwing officers were elected. President, Capt. A. Henry Higginson, So. Lincoln, Mass.; Vice-Presidents, Hugh J. Chisholm, Port Chester, N. Y., John LLinn, Manhatten, Kan., Percival Roberts, Jr., Nurberth, Pa., and J. H. Meyer, San Francisco, Cal.; Secretary, J. G. Watson; Sec.-Treas., W. F. Stephen.

PRIZE LISTS NOW READY

The St. John Exhibition Prize Lists are now ready for distribution. Copies may be had by applying to H. A. Porter, Sec., St. John, N. B.

NEW BRUNSWICK POWER COMPANY

7%

Cumulative First Preferred Stock

Dividends payable 1st March, June, September and December

Registrars, The First National Bank, Boston

DIVIDEND CHEQUES PAYABLE AT PAR AT ANY BRANCH OF ROYAL BANK OF CANADA, OR IN BOSTON FUNDS TO HOLDERS IN THE UNITED STATES

The New Brunswick Power Company owns and operates the electric light and power business, the gas business, and the system of street railways in St. John, N. B., and vicinity, serving a present estimated population of 65,000. The charter rights under which the company operates are without limit of time and contain no burdensome restrictions.

In March last an Act was passed by the Government of the Province of New Brunswick under which the rights of the preferred stockholders are fully protected and dividends assured.

The following important points are embodied in the Act:

1st. The Board of Directors are authorized to fix from time to time such rates for Railway Transportation, and Electric and Gas services, which may be necessary, after providing for operating expenses, depreciation, sinking funds and all other charges, to give them a net return of 8% on the rate base.

2nd. A rate base of $3,100,000 is declared as of the time of the passing of the Act. This amount covers the Bonds and Preferred Stocks issued.

On the present rate base of $3,100,000 the net earnings will be at least $248,000 per annum. After providing for bond interest, $87,500, this would leave $160,500, or over 2¼ times the amount required to pay the dividends on the First Preferred Stock.

Under the Act just passed, we consider this stock a conservative investment, which we feel justified in recommending strongly.

Ask for Special Circular.

PRICE: 95 AND ACCRUED DIVIDENDS, YIELDING 7.37 p. c.

GETTING RID OF FIELD MICE

A useful pamphlet, "Rodent Pests of the Farm and How to Control Them" may be secured from the U. S. Department of Agriculture, Washington, D.C. Ask for Farmers' Bulletin 932.

The most practical method of destroying field mice on a large scale is by poisoning and the following formula is one of several recommended by this bulletin:

Wet-Grain Formula.—Dissolve 1 oz. of strchnin (sulfate) in 2 qts. boiling water. Dissolve 2 tablespoonfuls of laundry starch in ½ pt. cold water. Add the starch to the strychnin solution and boil for a few minutes until the starch is clear. Pour the hot starch over one bushel of oats in a metal tub and stir thoroughly. Let the grain stand over night to absorb the poison.

The poisoned grain prepared by this formula is to be distributed over the infested area, not more than a teaspoonful at a place, care being taken to put it in mouse runs and at the entrance to burrows. To avoid destroying birds it should, whenever possible, be placed under such shelters as piles of weeds, straw, brush or other litter, or under boards. Small drain tiles 1½ inches in diameter have sometimes been used to advantage to hold poisoned grain and old tins cans with the edges bent nearly to gether will serve the same purpose.

Among the most effective natural enemies of field mice may be named the northern shrike or butcher bird, the food of which consists quite largely of mice, especially in spring and fall. The habit of this bird to impale mice and other prey on thorns and splinters of fences, etc., is well known. Owls and hawks also make a business of feeding on mice. No one acquainted with the habits of these birds will doubt the great mistake made by our legislature in placing a bounty on these useful birds.

Last fall two or three sparrow hawks were observed hovering over a meadow near Wooster, and were seen in the course of an hour or two to pick up two or three dozen mice. Later in the afternoon some hunters from town killed three or four of these hawks. No wonder the price of living goes up when men persist in violating Nature's laws in this manner.

Snakes are of considerable value as mousers, the harmless sort like garter snakes comparing well in value with the more dangerous species of rattlesnakes and copperheads. Minks, skunks and weasels destroy mice in great numbers; also, foxes prey gredily upon them. Grey squirrels probably eat them and of course domestic cats eat them; it is well known that cats prefer them to house mice.

Where it is possible to fence badly infested fields and pasture with livestock, mice the not apt to thrive. Hogs will quickly rid a field or pasture of mice. Sheep and cattle do not devour them, they destroy the nests by trampling so that well-pastured areas are inhabitated sparsely by mice.—Ohio Farmer.

TIRE WASTE FROM SPEEDING

Deductions show that excessive fast driving is destructive on ordinary tires. They also show that if the motorist could maintain an average speed of twenty-five miles an hour without incurring the displeasure of magistrates he would get more mileage out of his tires than at any other mark. Also that if he were one who insisted on "letting her out" he must obey two rules—drive slowly over rough roads and take turns cautiously and, as important as the other, increase the air pressure in his tires from two to eight pounds above normal—else resign himself to prodigal purchases of tires. For speeding, specially built tires are required.

IMPROVE YOUR BAKINGS

By Using

BEAVER FLOUR

THE solution to the problem of—"How to improve your bakings and make bread, cake and pastry which are real food treats"—is simple—use Beaver Flour.

Why? Beaver Flour is made from the finest of selected Ontario Winter and Western Hard Wheat. It contains the world-famed richness of the former, and strength of the latter. When scientifically blended, these grains produce a flour—Beaver Flour—which is unexcelled for purity and baking qualities.

Let Beaver Flour prove to you that it will improve your bakings. Try it and note the difference in your bread, pies, cakes and pastry.

Sold by your grocer.

THE T. H. TAYLOR CO.
LIMITED
Chatham - Ontario

234

It is a well known fact that the faster a tire is driven the more heat it generates internally, and while normal speed will not raise the temperature of the tire to a danegrous point, excessive speeding will raise the temperature to a point well beyond the danger line or to a point where additional vulcanization will take place—more than the manufacturer ever intended for the tire and sufficient to dry out, not only the friction gum between the plies of fabric but the very fabric itself, depriving the tire of considerable of its elasticity and its resiliency, in fact, part of its very life. This excess heat, drying out the fabric friction between the plies of fabric, naturally will cause a separation between the plies resulting in the fabric chafing against itself, or the plies of fabric chafing against one another, weakening it to that point where it can no longer maintain the air pressure, resulting in a blow-out.

Speeding has other bad effects on tires than prematurely drying them out. One of the most common is the result of driving at a fast pace over uneven or rough roads. Some drivers, unfortunately for the tires, drive at the same speed over a rough road that they would over a boulevard and then wonder why it is that their tires wear away so rapidly.

Watch a speeder negotiating a rough road at about as fast as his car will travel and notice the rear wheels in particular as they strike an obstacle, both at the same time; the shock comes so abruptly and forcibly that the rear wheels are raised free from the ground. Perhaps this is only an inch or so but while in the fraction of a second the wheels are off the ground, the tension is released on the engine, the wheels are spinning much faster so that when they again strike the ground the road itself must do some brake work and have an action on the tread of the tire much like that of a rasp being rubbed over its surface.

Now if it should happen that when the tires strike the ground after being thrown into the air, there should be a sharp pointed stone or other sharp obstacle at that immediate point, the result would be a nasty cut circumferentially around the tread. This might extend for but a few inches or it might extend half-way round the tire and might be deep and serious, and all brought about in the wink of an eye. In addition to this, tires used under these circumstances would no doubt lose their treads, not alone from the rapid wearing down but from a separation between the tread and the carcass, for it is easily seen that the tires leaving the ground frequently and coming down again, they would be revolving at such a velocity that their very contact with the road would bring about an extreme wrenching of the treads of the tires at this point. Very little action of this kind is necessary to bring about complete disintegration of the tire itself.

SQUIRREL POISONING AND BIRDS

It has ben asked whether the method of destroying squirrels published in the Gazette of Jan. 1 is not dangerous to birds. The formula used was as follows: Part 1—Add enough water to ¼ of a pound of Gloss starch to make a thin paste. Add 5 pints of boiling water, and boil until a clear smooth paste results. Part 2—strychnine alkaloid, 10 ounces; baking soda 10 ounces. Stir the strychnine and baking soda together and mix to a smooth paste with 2½ pounds of Karo corn syrup. Add enough of the starch paste to make this smooth if it is yet dry. Mix parts one and two and stir until smooth. Then add part 3—saccharine powder, 1 ounce; glycerine, 8 ounces. Add 1½ pounds of salt if necessary. Mix the above paste thoroughly with 160 quarts of

well-cleaned oats. The preparation should be put on runways and near holes; not in piles nor in burrows.

This method of poisoning squirrels is the one which the Bureau of Biological Sorvey recommends. It is being demonstrated by the bureau's repersentatives in Oregon, and extensive co-operative campaigns are now in progress on Government, state and private lands. Essentially, this method of destroying injurious rodents is being used in our campaigns against ground squirrels and prairie dogs throughout the western states. These campaigns have developed to very large proportions, owing to the direct benefit in increased crops and forage production which results from eliminating the pests. The work has already been done over many millions of acres. The method was developed with a view to obtaining a method that would be highly effective and at the same time eliminate as largely as possible destruction of useful birds as proper protection of such forms useful to the farmer is one of the objects for which the bureau is striving, The workers are constantly on the alert to detect cases where useful birds are destroyed in order to safeguard the birds. The bureau has followed these operations carefully and has repeatedly made detailed investigations to the effect of such poisoning operations on birds, and fells entirely safe in stating that no appreciable harm results to the bird populaation in connection with the poisoning campaigns. Few birds feed on cleaned whole oats and barleyl the grains chiefly used. Through the demonstration of the effectiveness of these grains as bait for the rodent pests, the bureau has unquestionably eliminated a large amount of bird killling, which formerly resulted from the use by farmers of poisoned wheat and grain containing small seeds. This has also largely resulted in discontinuing the use of phosphorous poisons for this purpose, these having been exceedingly destructive of game and other valuable birds. The bureau is therefore confident that in addition to rendering a large service to the farmers and stockmen of the west through teaching them the most practical and economical rodent pest and aiding them in organizing effectively for this work, it has also rendered an important service in the cause of bird protection by devising and introducing poisoning methods which eliminate the destruction of birds to a point where such is entirely negligible.—E. W. Nelson, Chief Bureau of Biological Survey, Washington, D. C.

MIXED FARMING vs SPECIAL CROPS

We meet many men of all kinds who claim that the farmer should specialize. Others, on the contrary, think that it is only general farming that pays. According to the best economists both of the United States and of Canada, the following are the respective advantages of these two kinds of farming.

First, what do we mean by general farming? We say that a person does general farming when he cultivates most of the plants and raises most of the animals common to his locality. A farmer who draws most of his revenue from one product or from two or three products of the same kind is supposed to do special farming.

Advantages of Specializing in Farming

1. A farmer who is a specialist usually acquires more competence in his line. It is much easier to gain lots of experience in one special line than in fifteen or twenty.

2. **Economy of capital.**—He who wishes to undertake several branches of farming at the same time must have the necessary equipment for each, which means many machines and buildings.

3. **Economy of labour.**—For example, a man who makes a specialty of growing potatoes can buy, not only the necessary machinery, but also all that which, while not absolutely necessary, is a useful help in this work while he who is raising a number of different crops cannot economically provide himself with all the machines adapted to the different crops.

4. **Easier Sale.**—Little attention is paid to the man who has only a few pounds of tobacco and a few bushels of potatoes to sell, while he who has carloads of one single product to sell easily attracts the attention of large buyers.

5. **Less suffering from neglect.**—With several different crops there are always some which require care and attnetion at the same time and so some have to be neglected while the others are being cared for.

6. **The culture of special crops gives more leisure time to the farmer**—For example: the culture of wheat in the West.

Advantages of General or Mixed Farming

1. **Rotation.**—It permits of rotation of crops which is of great aid in maintaining the fertility of the soil.

2. **It diminishes risks.**—Farmers who devote themselves to one specialty are liable to meet with severe losses at times when crops are attacked by disease or when weather or market conditions are unfavourable.—If, on the contrary, he raises a variety of crops and live stock, he will rarely meet with misfortune in all branches in the same year.

3. **It increases the spirit of economy.**—The same income is much less likely to be rashly spent when it comes in small sums than when it is acquired in a large block.

4. **A more even division of work.**—In mixed farming the work of men, horses, and machines is more evenly divided through every month of the year.

IN CONCLUSION.—Comparing the advantages and inconveniences of these two forms of farming we are of the opinion that in the majority of cases it pays better and is more prudent to follow mixed farming.

Card, the great American economist, does not advocate ordinary mixed farming, but rather a system comprising a limited number of crops which gives all the advantages of specialization, while at the same time permitting a rotation.

The cultivation of one specialty may be recommended under the following conditions:—

1. When it furnishes employment for men, horses and machines for the greater part of the year.

2. When it is very profitable and when the fertility of the soil may be maintained without rotation. For example: Market gardening near a city.

3. When the farm to be cultivated is too small for it to be profitable to establish rotation.

A Solid Cutting Foundation

AFTER all, the principal thing is to get the grain cut — all of it. And in order to do this successfully, a binder must have a smooth-working sickle that will not jam or bind, even when the binder is working on rough ground.

McCormick and Deering Grain Binders cut clean — and continue to do so during the entire life of the machine. There is no twisting, sagging or springing of the cutter bar, because the knife works forth and back on a solid foundation — a T-shaped steel sill that effectually resists heavy strains imposed by operation in rough, uneven fields. There is no rubbing of sickle sections against guards nor binding due to springing or twisting of the sill, for it *does not twist or spring.*

This is only one of many features that make **McCormick** and **Deering Grain Binders** so efficient and dependable — that have won for these harvesting machines a world-wide reputation for economical, satisfactory service.

Your nearby International full-line agent handles these standard-setting harvesting machines. See him, and place your dependence also in **McCormick, Deering,** or **International twine,** and your harvest will be well within your control. Place your order early —service will follow.

MARKET REPORTS, JUNE 15, 1920

Extracts From Reports

Toronto, Eggs—There has been a little easier undertone during the past week, but very little material change in prices. Specials are down one cent and now jobbing at 57c, extras 55c, firsts 53c, and seconds 44-47c. Some eggs have arrived from the prairie provinces, and more are reported en-route. Last week end several dealers had offers of April and May storage for fall delivery, all charges paid and 46½c f. o. b. Chicago. Exporters report the situation to be improving with some sales for fall shipment and a prospect of business for prompt shipment. Storage stocks have increased considerably during the past week. From June 1st stocks on hand of fresh and storage at Ontario points amounted to 81,260 cases (for comparative figures see eblow. Poultry—There has been a material increase in the receipts of broilers and fowl during the week, and prices are lower. Other varieties unchanged.

Montreal, Eggs—This market has undergone little or no change during the past week, prices ruling about steady with specials jobbing at 57c, rehandled current receipts 54-55c and seconds 48-49c. There seems to be some different in opinion among exporters and some still claim that they have not had bids high enough to warrant business, while others have closed contracts for fall shipment. Receipts for the week ending June 12th were 15,961 cases as compared with 16,981 cases for the previous week and 13,609 cases for the same week last year. Poultry—The poultry situation continues practically unchanged except for a slight increase in the receipts of broilers and fowl.

Winnipeg, Eggs—Receipts continue to show a falling off and the quality from some sections is very poor. The interprovincial movement during the past week has been light, the bulk of receipts being stored. Quotations to country shippers have declined to 38c delivered and current receipts are jobbing at 43-44c. Poultry—A few shipments of live fowl are now arriving.

Regina, Saskatoon and Moose Jaw, Eggs—Receipts continue light, though there is still a slight surplus for local consumptive demands. Prices to country shippers range from 35-37½c, cases included. Poultry—No business reported.

Calgary, Eggs—Dealers dropped their buying price last week to 35c delivered loss-off. Quality of fresh receipts continues very poor, some packers stating that 75% are seconds. Poultry—No change.

Edmonton, Eggs—This market is unchanged since the commencement of last wee kand price to country shippers dropped to 35c. A few eggs are still going into storage and the jobbing trade is reported dull. Poultry—No business reported.

Vancouver, Eggs—This market remained unchanged last week for local fresh, with United States fresh slightly lower at 52-53c and prairie province fresh at 48-50c. Imports during the past week amounted to 134 cases of States eggs, 40 cases of frozen eggs, and 4 cases of egg albumen. Poultry—Market unchanged. Live broilers continue to arrive freely, also hens. The market is firm for dressed poultry.

Maritime Provinces, Eggs—From 44-46c is being paid at country points on Prince Edward Island and current receipts are retailing at 48c. Production is reported very heavy and country storekeepers claim they have never handled as many eggs in any previous week as last week. Quality still continues good. For the week ending June 12th, 2,565 baby chicks were distributed from Charlottetown. The inter-provincial movement of eggs last week amounted to 885 cases and the export movement 50 cases. On the main land prices are slightly lower and in New Brunswick 40-42c is being paid to producers, while the St. John trade is offering 44c f. o. b. to country shippers and 46-48c delivered.

Review of the Situation

Eggs—An effort has been made to get prices down at country points in Ontario, but judging from reports received from track shippers, this pressure has had little effect so far. They claim to have paid stores and farmers 46-48c, and the latest sales they have made were on a basis of 49c for current receipts cases returnable, and 53-55c for firsts cases free f. o. b. Government inspected. Some of the large operators at Toronto say they have received eggs from the prairie provinces costing 42½c f. o. b., and have more on the way. These they claim can be sold at 48c and even less, and show a profit. There has been no material decline in production although at some points there is a falling off in receipts. Several wires were received from Chicago towards the close of the week, offering Minnesota firsts April, May at 46½c f. o. b., all charges paid to end of season.

The western situation is easier and the prairie province trade is offering 35 to 38c delivered loss off to country shippers. Though receipts are falling off there is still some surplus over consumptive requirements that is being stored.

Inspections last week for interprovincial and intraprovincial in the East, numbered 15 approximately 6,000 cases, and there were 6 inspections in the Western provinces.

The United States markets have remained fairly steady. Supply was large and demand only fair, principally for northern stock. Chicago quotations current receipts firsts 38-39½c, storage packed firsts 41½c, extras 41¾-42c.

Storage stocks June 1st were as follows:—

1920, June 1st.....	5,106,747 cases
1919, June 1st.....	6,098,448 cases
Decrease.....	991,701 cases

Poultry

There has been a material increase in the receipts of broilers and fowl during the past week and prices in consequence are lower. Other varieties remain unchanged. A few crates of live spring ducks were received at Toronto during last week from a duck farm in Quebec. These are being sold to a special trade which is limited owing to the high cost. Storage poultry is now in small compass and is fast cleaning up.

The United States dressed poultry market has been barely steady, a good deal arriving in poor condition dues to delay in transit. Live poultry opened this week easy but there has been a gradual improvement in the demand.

Storage stocks June 1st were as follows:

1920, June 1st	30,540,230 lbs.
1919, June 1st	55,615,989 lbs.
Decrease	25,075,759 lbs.

EXPORT

Eggs

There has been quite a revival in the export egg trade and it is reported a number of sales have been made for fall shipment by country packers in Ontario. The prices obtained have not been learned, but it is said they will show a useful profit. A small shipment of fresh firsts went forward last week to Great Britain. Recent cables indicate a much better tone to the British market. (See below.)

Poultry

No business.

Latest British Prices (Cables)

London, July 14th, 1920:

Market again firmer, English 32/—34/, Irish 29/—32/, Danish 32/—33/, Chinese 23/—35/. Large chickens short and wanted, Irish plentiful and lower.

Glasgow, June 14th, 1920:

Market firmer, Irish spot 29/—30/ f.o.b. 27/—29/, arrivals limited, demand good. Danish sixteens 28/, eighteens 29/6 strong demand supplies insufficient due Irish shortage. Retail 2/10/ 3/4, Government considering maximum prices for autumn.

British Market Letter

There has been a fairly steady market during the past week, though at the commencement, trade was quiet owing, no doubt, to the holidays. All descriptions of best eggs, including Danish, which have arrived at various ports this week, have moved freely, and prices are unchanged form last week, except perhaps in the case of some out of condition lots. Next week there will be Chinese, and a small shipment of States to be dealt with, also further arrivals of Irish 27/- 28/-, Danish 27/ 32/-, according to weight. Quotations from Ireland are inclinde to be a little firmer, though I do not think there is any likelihood of this market advancing. James Gillanders, London, Eng., May 29th, 1920.

NO more fears when the thunder clouds gather—if your buildings are roofed with Pedlar Steel Shingles. These shingles lock together on the roof into one continuous sheet of steel that repels lightning. A Pedlar steel roof cannot take fire from any cause. It is also proof against every kind of weather. Send us the dimensions of your buildings for free estimate. We will prove that, service considered, a Pedlar Steel Roof is the cheapest Roof to buy.

AGENCIES EVERYWHERE

British Egg Imports, 1920

The British Board of Trade have issued figures on the imports of eggs for the first four months of this year, January, February, March and April.

1920 .....22,011,340 dozens
1919 .....15,784,480 dozens

Increase ..... 6,226,860 dozens

The United States proportion of these imports was:

1920 .....2,297,630 dozens
1919 .....4,610,410 dozens

Decrease .....2,312,780 dozens

United States Export of Eggs

The following are the comparative figures for the exports of eggs from the United States for month of April, 1920, and 1919, as compiled by the Bureau of Markets, United States Department of Agriculture.

April, 1920 .....1,743,480 dozens
April, 1919 .....3,087,928 dozens

Decrease .....1,344,448 dozens

Cold Storage Eggs

A bulletin has been issued recently by the New York Division of Food and Markets from data assembled and compiled by H. D. Phillis of the Bureau of Markets and Cold Storage. The following is an extract dealing with certain prejudices and misapprehensions regarding eggs that have been held in cold storage:

"Much of the bad reputation which cold storage eggs have gained is ill-founded. The mere fact that an egg has been held several months in storage does not mean that it has deteriorated to any great extent, for its quality at certain times of the yaer is actually apt to be better than that of the average "fresh" egg arriving on the market. The unpleasant flavor usually acquired by a cold storage egg may or may not be sufficient to injure its use for most forms of cooking, depending on the conditions under which it has been stored. Lastly, an egg which has not been in storage over seven months is not apt to have acquired a sufficient flavor to be objectionable nor to have deteriorated far enough to affect its wholesomeness or edible qualities."

HERD IMPROVEMENT IN PRINCE EDWARD ISLAND

In 1914 a number of patrons of the Tryon Creamery took up cow testing and have followed the work consistently right up to the present time. For the five years ending in 1919, every farmer has made a substantial increase in the average production of his herd.

In one or two herds the increase was as much as 74 percent. which meant that these men received nearly twice as much milk from the same number of cows in 1919 as they received in 1915. The average increase in butter fat production for all herds was 33.1 lb. per cow. or in other words the increase in the average production of each cow was 33 percent. One farmer had a net profit of $78.57 per cow from his herd of 14 cows. after allowing on an average of $100 per cow for feed.

If the production of every dairy cow in Canada could be increased as much as the production of these Prince Edward Island herds, it would mean an increased revenue of many millions of dollars from dairy products. This is just another instance of what can be accomplished by cow testing. It pays big returns.

UNITED DAIRYMEN COOPERATIVE LIMITED

The United Dairymen Cooperative Limited. held their first auction sale of cheese in the Board of Trade rooms. Montreal, on the 4th instant. The cheese sold by the United Dairymen Cooperative Limited, will be graded by an official of the Dairy and Cold Storage Branch, Department of Agriculture, Ottawa. The grades and standards used will be those adopted by the conference of Dominion Dairy Officials held in Ottawa in November, 1918, and are as follows:—

Special Grade—Score 94 to 100 points. Minimum for flavour, 41 points.

First Grade—Score 92 and under 94 points. Minimum for flavour, 39 points.

Second Grade—Score 87 and under 92 points. Minimum for flavour, 37 points.

Off Grades—Score under 87 points and under 37 points for flavour.

Standards for Grading Cheese

Special Grade—Flavour, clean, sound and pure; Texture, close, firm and silky; Colour, good and uniform; Finish, even in size, smoothly finished, sound and clean surfaces, straight and square; Boxes, strong, clean, well made and close fitting. If made of wood the ends to be of seasoned timber. Weights stencilled or marked with rubber stamp.

First Grade—Flavour, not quite clean; Texture, slightly weak or open; Colour, uniform; Finish, fairly even in size, well finished, sound surfaces; Boxes, strong, clean, well made and close fitting. If made of wood the ends to be of seasoned timber. Weights stencilled or marked with rubber stamp.

Second Grade—Flavour, "fruity" not clean, "turnipy", or other objectionable flavour; Texture, weak, open, loose, "acidy", too soft, too dry; Colour, uneven. mottled, or objectionable shade; Finish, very uneven in size, showing rough corners, black mould, dirty or cracked surfaces, soft rinds; Boxes, too large in diameter; top edge of box more than half an inch below the top of the cheese. Made of too light material. Ends made of improperly seasoned material.

Off Grade—Flavour, rancid, badly "off", anything inferior to second grade; Texture, very weak, very open, showing pin holes, or porous, very "acidity", very soft or very dry; Colour, badly mottled or very objectionable shade; Finish, anything worse than second grade; Boxes, no question of boxes sufficient to make off grade if other qualities are good.

THE USE OF ARMOURIES FOR POULTRY SHOWS

The Canadian National Poultry Association recently made representation to the Federal Department of Agriculture with a view to obtain permission from the Department of Militia and Defence to allow the use of armouries for the holding of poultry shows and exhibitions.

In this connection the Dept. of Militia and Defence state that subject to the interests of Militia Units not being adversely affected, instructions were issued some time ago to General Officers commanding districts that they were authorized to permit the loan of armouries for any specific purpose by non-military organizations, subject to either fire insurance being taken out on the building by those proposing to use it, or special arrangements satisfactory to him (General Officer commanding District) being made to safeguard the building

In the event of any Poultry Assoc. wishing to use an armory for show purposes, a request should be made to the General Officer commanding the District stating the dates upon which the show is to be held.

The efficiency of the hog is determined by his ability to make a maximum gain on the minimum amount vof feed. To do this the young pig must be kept thrifty and suffer no set-back through improper feed or feeding.

MONCTON

You Can Count on Moncton, N. B. Here in the most progressive City in The Maritime Provinces. The Population Has Doubled in the Last Ten Years ; The City is well kept and Boasts more Miles of Paved Streets and better Streets generally than any other Maritime City.

Excellently Located, it is the most convenient railway and Distributing Centre and was selected by The T. Eaton Co. Ltd. for their Maritime Province Branch on this account; other large Institutions are to follow.

Moncton is essentially a City of Homes and Industry, the home of Marven's Biscuits. Atlantic Underwear, Humphrey's Woolens, etc.

We offer as one of the Remarkable Investment Opportunites which this year affords.

NEW ISSUE

$200,000 City of Moncton 6 p.c. Bonds

DUE JULY 2, 1940 and

$193,000 City of Moncton 6 p.c. Bonds

$9,500 DUE EACH YEAR, BEGINNING JULY 1, 1921

PRINCIPAL AND SEMI-ANNUAL INTEREST PAYABLE AT MONCTON, ST. JOHN, HALIFAX AND MONTREAL.

Denominations, $500 and $1.000. Price, $98.50 with intereet

AS THIS ISSUE IS SMALL AND AN ATTRACTIVE ONE, IT WILL BE QUICKLY ABSORBED. SEND ORDER ON ATTACHED FORM BY RETURN MAIL.

AGRICULTURAL MACHINERY BECOMING MORE AND MORE COSTLY

Agricultural machinery, like everything that is now sold, shows a continual advance in price to which there seems to be no limit.

The lack of manual labor, the constantly growing demands of agriculture, which expand with its progress, oblige farmers to supply themselves with all the latest and most improved machinery, to which additions are constantly being made.

It is only natural, therefore, to suppose that the present high cost of living would have led all farmers to take a little more care of their agricultural implements, which formerly completely neglected.

Unfortunately this is not the case. What particularly strikes one, when visiting what is considered to be a well kept farm, is to see a number of farm implements of all kinds, not in the yard of the farm, but scattered here and there all over the fields; and this is true in the case of even more or less complicated machinery, such as seeders, reapers and sometimes thrashing machines.

We are not speaking of ploughs, harrows and rollers, which are forgotten for years and lie covered with a vegetation that seems to be respected. Nevertheless all this material is worth something. It is difficult to understand why such a condition of mind should be found among the people on our farms today and why there is not more effort made to make some use of what represents real capital.

It is true that very often material thus abandoned in the fields is in such a condition that it is impossible to get anything but scrap iron out of it. Even so we should think of the old material and gather it up and get rid of it.

How are the different machines cared for on most of our farms? The plough, once the polughing is finished for the season, is put back in a corner without any preliminary cleaning; the reaper or the binder, still dirty and covered with cobwebs meet with similar treatment, and all agricultural tools are treated in the same manner. This will not do. The consequence of such neglect is fatal: rust caused by exposure to rain encroaches upon all the metal parts; mud and dust accumulate on the gear and in the openings intended for oiling purposes, thus rendering the instruments unfit for all work when they are required for use. Under such conditions these machines wear out more quickly when remaining stored than when in actual use. The owner will be lucky, too, if at such a time, an employee, attempting to become a mechanic all at once, does not attempt to put in order a piece which is not working well: with the aid of a wrench or a crow-bar, the new machanic attempts to set things going and with a hammer bends the piece if he does not cause a serious break. As to the dirt of the parts to be oiled, it will cause the machinery to clog and stick, necessitating repairs by an able blacksmith.

Thus simple neglect of proper care of the working stock, will always result in a loss of money, and in addition, a loss of time, which s equally very costly. Yet, it appears very easy to avoid the inconvenience due to such a lack of care. What is easier than to clean up the farming implements when we have finised using them? At present prices it is well worth while.

BIGGER PROFITS FROM LAMBS

Farm flock owners, particularly those of the east, are being exhorted by the Bureau of Animal Industry, sheep specialists and livestick interests to dock and castrate their lambs. For some unexplained reason the sheep raisers of these sections have been prone to neglect these operations, although they are in the interest of both the lambs and the pocket books of their owners. These same farmers, it is pointed out, would never think, of letting their bulls or their boar pigs, not intended for breeding purposes, remain entire, and yet they fail to follow the same practice in the case of their buck lambs.

Numerous sound reasons are advanced for docking and unsexing lambs, the mose forceful being perhaps of profit. "Bucky" lambs are frequently discriminated against on the market, because when left entire they are generally coarse and strong in flavor. The castrated lamb is a better lamb and deserves a better price. It is said to develop more rapidly and to flesh mor uniformly. Unsexed ram lambs are more easily managed, they are quieter and can be allowed to run with the ewe flock.

One of the strongest arguments advanced for castrating lambs is that this practice is almost universal in the west, where lambs for market are raised in lots of thousands. The range men have learned by experience that it pays. And yet it is estimated that about eighty per cent. of the ltmbs coming to market from the farm-flock states are both uncastrated and undocked.

Docking is urged primarily for the reason that the tail is an appendage of no particular benefit to the lamb—male or female. Removed, it makes for a neater and more attractive animal and guards against the accumulation of filth around and beneath the tail. Left on the femles, it may interfere with breeding. Sanitary reasons, if none other, make docking important.

"We consider it very essential that lambs be trimmed—not only castrated but docked," writes H. A. Phillips, of Armour & Co. "A lamb that is so treated matures into much better animal, the quality of meat is improved and he sells on the open market for from two to three dollars per hundred more than if left entire."

As far as the market is concerned failure to castrate is a two-edged weapon. Bucky lambs bring less themselves because they are inferior in quality to wether lambs and ewe lambs, and because of the large numbers that are thrown on the market from the so-called native-born lamb states, they pull down the price for better-quality stuff.

Sheepmen are greatly interested in the "Eat More Lamb" campaign now being carried on to induce the meat-eating public to consume more lamb and mutton. But a roast from a bucky lamb, coarse-fleshed and strong-flavored, may undo at one sitting weeks of educational effort.

"The marked discrimination shown by buyers against strong weight and heavy ram lambs and the harmful influence on consumptive demand accruing from the slaughter of such great quantities of stock that cannot make a satisfactory food product cannot be fully realized by the producers," writes G. H. Bedell. of the Bureau of Animal Industry.

"Big, coarse ram lambs produce by no means the best meat, neither do the thousands of thin, untrimmed cull native lambs that have to be slaughtered because the feeder will not buy them. It is not surprising that the consumer balks at such meat and refuses to eat it. With our markets flooded with low-grade lamb the average consumer, a poor judge of meat on the block, has

Objections by farmers that castrating and docking are difficult and risky operations are swept aside by all sheep specialists. To the contrary, they declare, both operations can be performed safely by any average person.

THE MANUFACTURE OF CLOVER SILAGE

(Experimental Farms Note)

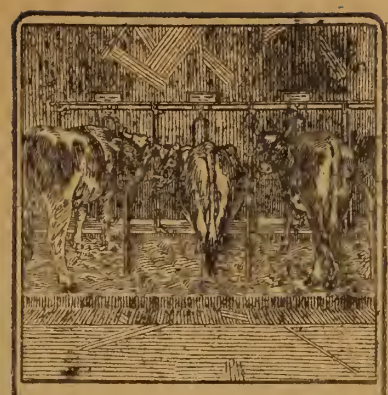
We are but beginning to appreciate the value of clover silage in modern stock feeding. When properly made clover silage is an excellent feed for nearly all closses of live stock. Aside from its higher protein content, it has an advantage over corn silage in point of lower cost of production. The yields of clover compare favorably with those of corn when the land has ben equally well prepared.

Seldom are fields seeded down to a purely clover mixture. Usually some of the standard grasse are added. On the Agassix Farm we use a mixture containing red, alsike and white Dutch clover, also Italian rye and orchard grass. This makes good silage but the greater the percentage of clover in the mixture the higher the feeding value, and the easier it is to make a silage of good quality. The grasses are inclined to be more wiry stiff and dry, thus requirng more weght to press the mass firmly into the silo to exclude air.

The most common practice is to cut the clover for the silo when in full bloom, that is, when right for hay making. Care must eb taken not to leave the harvesting period too late. It is better to err on the early side rather than postpone the cutting too long. While the plants are young the stalks and leaves are more tender and break up more easily. There is also the advantage of obtaining an earlier second crop. Only as much should be cut at one time as may be placed in the silo during the day. The mower should be started early in the morning while the dew is on and followed at once by the rate. The clover should not be left to wilt between cutting and siloing. If severe wilting does take place better results are obtained by adding water. The clover ought to feel wet as it drops in the silo. Frequently attempts are made to make silage out of clover after it is spoiled for hay. This is a poor policy. Partly spoiled clover makes very inferior silage as it loses its colour and likely decay has begun.

Clover silage has been made with some degree of success by placing in the silo without cutting. This should not be done if it can be avoided. Not only is there less liability of the clover spoiling when cut into short lengths, but it can be placed in the silo and also removed with much greater ease. The knives on the cutter must be kept sharp and set to cut approximately half inch lengths. It is a good plan, where possible when siloing clover, to put a layer of corn on top to weight down the mass below and secure a more thorough packing and thereby also a better quality of silage.—W. H. Hicks, Superintendent Experimental Farm, Agassiz, B. C.

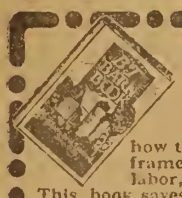
Some one has said that it is better to be a pessimistic optimist than an optimistic pessimist. It is well to keep this motto in mind at this time when labor is scarce, and the cost of production is sky high. Conditions will in time change for the better and those farmers who have "carried on" in spite of many discouraging factors will be in a position to profit when normal conditions return. The world needs more farm produce, and there will be a big demand for such for many years to come.



1. BT Steel Stalls keep the flanks and udders of the cows clean. Cows are lined up so that the droppings fall in the gutter. The cow has all the freedom necessary for her comfort, but is tied so that she cannot dung on the cattle stand.

2. If cows are tied with chains in double stalls they can move forward and sideways. The cattle stands are always dirty. When the cows lie down of course they get dirty too. That means that you must clean them off carefully before milking, or else get dirty,, unsanitary milk.

3. Babies, children and invalids depend upon milk for their lives. It must be clean. Cities and Dairy Companies are becoming very particular about its cleanliness and purity. Clean, sanitary cow stalls are absolutely essential if milk is to be clean. The coupon below will bring further proof. Send for it to-day.



Send this coupon for the 352-page Barn Book. Tells how to plan and build the barn, how to ventilate, how to frame, how to save steps, labor, time and feed. This book saves you hundreds of dollars in building. It is free.

Two Cents a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 2 cents a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is 2 cents a word, each insertion. MARITIME FARMER, Sussex N. B.

FOR SALE.—Pure bred Holstein bull calf, born April 27th. For particulars write H. MacINTYRE, Box 525, Campbellton, N. B.

A BOOM IN SHEEP BREEDING

Compared with the product of other countries sheep breeding in Canada does not appear prolific. In Australia there are twenty-five times as many sheep as there are here. In the United States thirteen times as many and in Great Britain nine times as many. That this fact is becoming recognized and that efforts are being made to improve the situation is shown by a series of articles on sheep extension work in the different provinces that appear in the Agricultural Gazette of Canada for May. These articles show that the subject is being taken up in a very practical way by at least seven of the nine provinces. Presumably in the other two, British Columbia and Prince Edward Island, although not set forth, like measures are being taken. In short, there are prospects that sheep raising and mutton and wool producing are going to receive in the next few years very considerable impetus. The efforts put forth to bring this about consists mainly of the distributing of pure bred rams, the holding of competitions for which prizes of considerable value are given for the best eyes and for the best flocks, of organized sheep sales, of obtaining the highest price for wool through the provincial departments of agriculture and through the Canadian Wool Growers' Association, of demonstrations in shearing and of other matters connected with sheep raising, and by placing flocks, as in Ontario, on a share basis. In addition drastic legislation has been passed looking to the protection of sheep from dogs. It is noteworthy that in many instances credit has been arranged with the banks so that funds may be procured on fairly easy terms to be used in the purchase of pure-bred rams and high-grade ewes.

EGGS 45 CENTS

For the next two weeks we will pay 45 cents pe rdozen for fresh eggs, delivered St. John. Send in case lots by express to The Maritime Farmer, St. John. We will take one or more cases but shipments should be in three case lots or over, wherever possible. If you can't ship eggs this season, get in line for later business. Induce your neighbors to co-operate with you. All eggs must be strictly fresh. This is more imperative, now that warm weather is coming on.

DAIRY BUTTER.—We will pay fifty cents per pound f. o. b. St. John for good dairy butter. This price will hold good the next two weeks. Ship in lots of one hundred pounds or over and send by express. We want good butter. Do not ship stock that is inferior. Address all packages to The Maritime Farmer, St. John, N. B.

In forwarding parcels put your name and address on all goods, as well as The Maritime Farmer, St. John, N. B. Notify us at Sussex, of any shipments.

SELECTING THE SOW

The gilts that are to be developed for brood sows should be separated from the remainder of the herd of hogs at weaning time. In selecting them choose first of all gilts from mothers that have been satisfactory sows. Then get those that have a feminne aippearance about the head. It will pay also to count the teats on the udder and keep those that have twelve or fourteen teats rather than those with only eight or ten. In conformation the sows that have good long bodies, strong backs and large heart girths will invariably give the best results as brood sows. In so far as possible only gilts with good big bone in their legs and strong pasterns should be retained. Having made the selection the gilts that are to be developed as brood sows should be run in a pasture field and fed in such a way and with such feeds as will develop rapid growth but avoid excessive fattening.

Praise your own breed of cattle all you like but don't knock your neighbors breed. There is a place for each breed of cattle. There are good and bad representatives of all breeds.

There is little excuse for any one using a grade or scrub bull when it is so easy to secure a pure-bred bull.

SUNNYSIDE STOCK FARM

Ayrshire Cattle and Chester White Swine

Present offering: one bull two years old, two aged seventeen months. Also a number of younger ones. Females any age. This herd is bred for production having the combined strain of "Jean Armour" and "White Heather"

Phone 111. - - - - Sussex, N. B.

HIGHLAND LAKE HOLSTEINS

Herd sire, AVONDALE PONTIAC ECHO (under lease) a son of MAY ECHO SYLVIA, the world's record cow. Only one other 41-lb. bull in Canada.

We have young bulls for sale whose two nearest dams (both Canadian champions) average as high as 35.62 lbs. butter in seven days; another whose two nearest dams are both 100-lb. cows; and one ready for service from a 41-lb. sire and an 18,000-lb. two-year-old dam. Send for our BOOK OF BULLS. A few females for sale. Satisfaction guaranteed.

R. W. E. BURNABY (Farm at Stop 55, Yonge St. Radial) JEFFERSON, ONT

NETHERLAND FARM, HAMMOND RIVER, N. B.

We are offering for salo calves of both sexes, sired by Dutchland Pietcrje Count, a bull of splendid size and type, whose four nearest dams have records averaging 28.61 pounds of butter in seven days. His dam is a daughter of Colantha Johona Lad, who was 101 A. R. O. daughters 4 over 32 lbs., 7 over 30 lbs., three of them world's records for 365 days. If you want something choice, come and see these calves or write for further particulars.

We will also book orders for young Yorkshire pigs for the next spring's delivery.

WM. S. HARDING, Prop.

ELMHURST SHORTHORN STOCK FARM

Present Offerings—Six exceptionally good red and roan bulls, 10 to 18 months of age, from superior milking dams. Write me for prices and particulars before placing your orders elsewhere

C. C. H. EATON, - - - CANARD, N. S.

COBEQUID FARM HOLSTEINS

We have a number of fine young registered bulls, to offer. They are sired by Prince Colanthas Canary B., and out of good producing dams.

We can make prompt shipment. Correspondence invited.

S. DICKIE & SONS, R. R. No. 5, TRURO, N. S.

BULL'S CREEK FARM

R. O. M. HOLSTEINS

EXTRA SPECIAL—I recently imported several Tuberculin Tested R. O. M. daughters of "Sir Lyons Segis" whose six nearest dams average over 30 lbs. butter each in seven days. These cows have in turn been bred to "Riverdale Lyons Echo Posch" whose dam, grand-dam and great grand-dam and dam's sister average officially 34 lbs. butter each in seven days. Am offering young bull calves of this remarkable combination of breeding and will sell a heifer calf or two. Get your orders in quick, they won't be here long.

J. H. STOCKTON, BULL'S CREEK FARM, WOODSTOCK, N. B.

Special Offering

Maple Green Farm Holsteins

On account of the great shortage in the supply of milk in our home town, we have decided (with regret) to dispose of our entire crop of Bull and helfer calves.

If taken inside of the next 30 days will price them away below their value.

The Dams of these calves are now running in the R. O. P., and the last official test conducted by the R. O. P. inspector showed an average test of 4.62% fat for the lot.

All are sired by our 32.32 lb. herd sire "King Korndyke Johanna", whose Dam is a full sister to Canada's Champion R. O. P. cow, "Jemima Johanna of Riverside". Milk in 365 days 30373; butter in 365 days, 1280 lbs.

Phone or write,

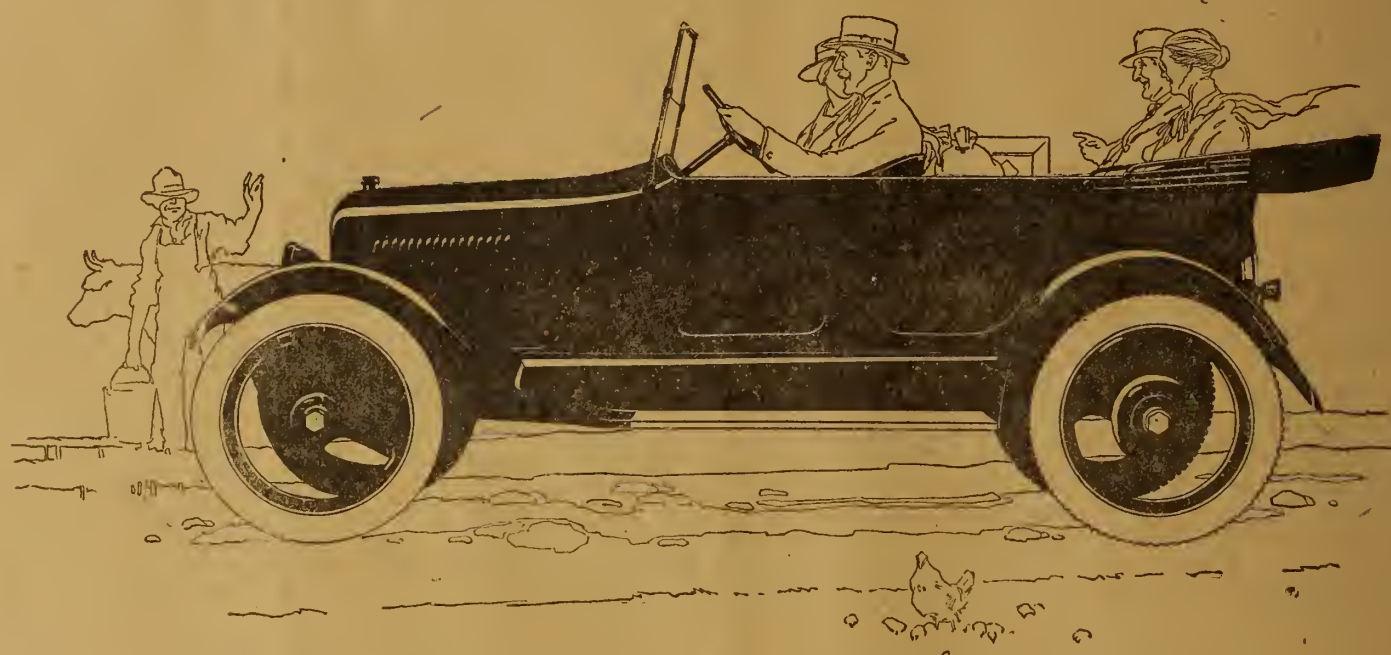
Overland

TRADE MARK REG.

Features That Specifications Fail to Describe



FARMERS want facts. It is a fact that farmers all over Canada testify to the remarkable comfort, economy and sturdiness of the Overland.

It is a fact that the car has demonstrated its stamina to farmers in every province---its capacity to stand all kinds of punishment without damage.

It is a fact that farmers everywhere are finding that the Overland handles and turns easily, and that it costs little to own and operate.

Examine its bright, weather-resisting enamel finish.

See how easily its detachable upholstery removes for carrying farm produce to town, or farm supplies from the city.

Experience its many conveniences, such as electric starting and lighting, and three-speed transmission.

Note how high-grade and complete it is in every respect.

To fully appreciate how smoothly it rides, pick out rough roads and drive it.

Then you **know** what a wonderful car the Overland really is for rural districts and varied uses on the farm, and why it is gaining in popularity among farmers.

In one large Canadian plant, the Overland is built under the supervision of Canadians who appreciate Canadian conditions and build accordingly.

Have your nearest Overland dealer demonstrate this car over a particularly rough stretch of road.

Or send for illustrated catalogue.

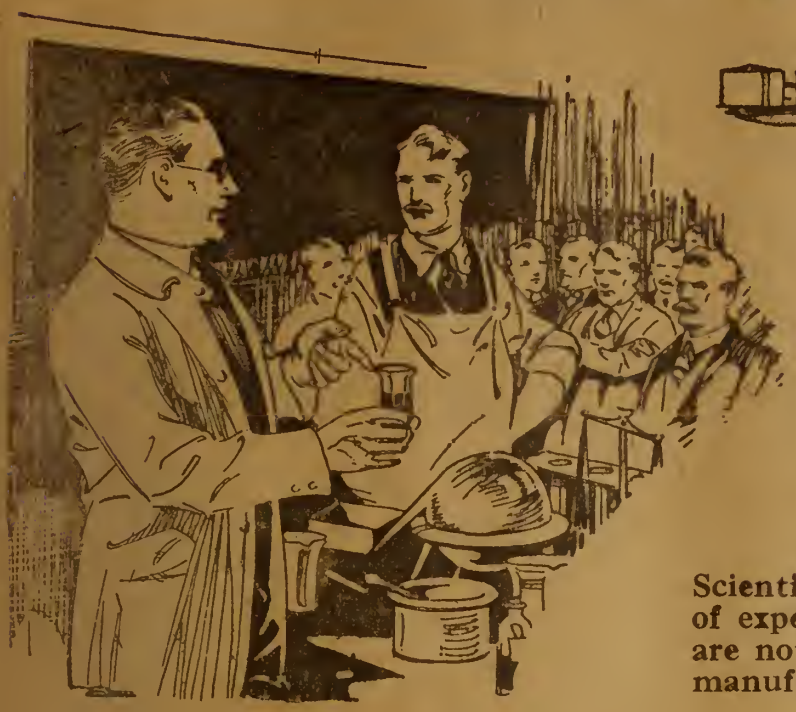
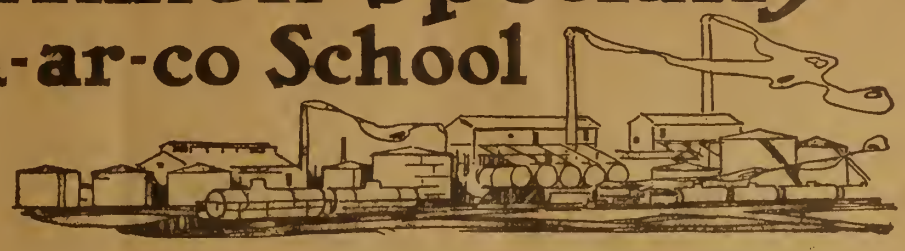
We Train Workmen Specially in our En-ar-co School





for the scientific production of

En-ar-co Motor Oil

Scientific processes of refining, developed during 35 years of experience and testing in the En-ar-co laboratories, are not entrusted to "green" hands when it comes to manufacture.

Trained Workmen

who have passed strict examinations in our special school, are employed in the production of En-ar-co Motor Oil.

This ensures a uniformity of quality that makes En-ar-co Motor Oil absolutely dependable. It never varies: every barrel is the same.

What This Means to the Farmer

Scientific refining has made En-ar-co Motor Oil a perfect lubricant for your tractor, car, truck, stationary or other farm engine. And perfect lubrication means more power and longer life for the engine.

No clogging deposits can form when you use En-ar-co Motor Oil. It coats all moving parts with a smooth, velvety film, that will withstand pressure and remove fricton.

Other Members of the En-ar-co Family:

White Rose' Gasoline

A pure, dry engine fuel, that means extra power and "pep."

National Light Oil

A clear-burning, sootless oil for lamps, stoves, incubators and brooders. Best fuel for kerosene-powered tractors.

En-ar-co Motor Grease

For differentials — gears — transmissions, on motor cars and tractors.

Black Beauty Axle Grease

A smooth, wear-resisting grease, that removes the grind and squeak from axles.

Order En-ar-co Products from your local dealer. If he hasn't got them, write us direct and we'll see you are supplied promptly.

This Game Sent Free

A fascinating game in which autos compete in a cross-country race will be sent FREE to any auto, tractor, truck, motor boat or engine owner who will fill out the attached coupon and mail it to us.

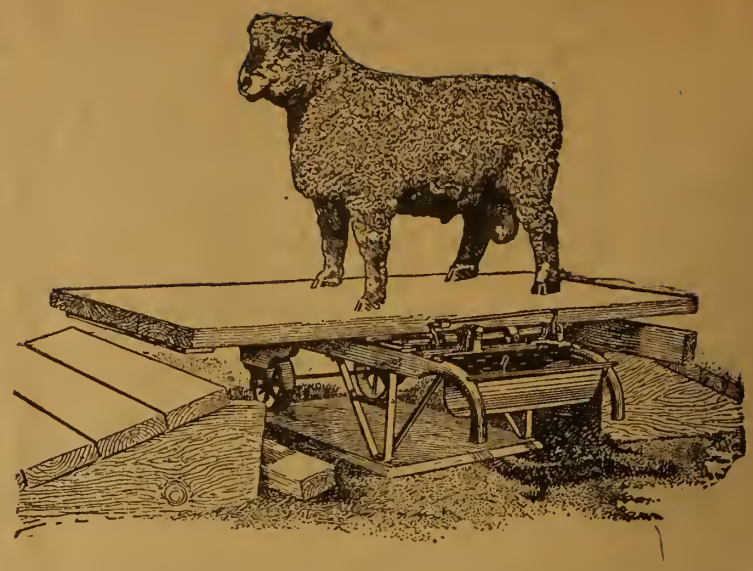
A Reliable Scale Takes the Guess Out of Selling



SCALES on the farm will save you money. They take the doubt out of your business transactions. Even the smallest grocer who has only about one-twentieth as much money invested as the average farmer, and does not do nearly the amount of business, has a pair of scales.

The Renfrew Handy Two-Wheel Truck Scale will weigh anything from 1 lb. to 2,000 lbs. It can be wheeled around as easily as an ordinary truck, and when not in use can be tipped up and stood in a corner out of the way. The

Renfrew
TRUCK SCALE

will weigh accurately wherever you use it, whether in the barn, on the road, or in the field. It is self-adjusting, and will weigh accurately on uneven ground. This makes it particularly desirable as a farm scale. There is no need of having to level up the scale every time you use it.

The sills are made of solid oak, with 7-16″ bolts. Everything about the scale is staunchly and carefully built. It is carefully tested and inspected during the various steps in the process of manufacture.

MADE IN CANADA

The Renfrew Truck Scale is a purely Canadian product. It is manufactured with Canadian capital, by Canadian workmen, and every Scale that leaves the factory is certified correct by the Department of Weights and Measures. Every Scale has its Government Certificate.

The Renfrew Truck Scale saves Canadian farmers thousands of dollars annually.

Send a post card to-day for full particulars, or see our nearest dealer.

THE MARITIME FARMER

AND

CO-OPERATIVE DAIRYMAN

REGISTESED TRADE MARK

Official Organ of The Farmers' and Dairymen's Association of New Brunswick, The Nova Scotia Farmers' Association, The Nova Scotia, New Brunswick and P. E. Island Fruit Growers' Associations, The Maritime Stock Breeders' Association, The Maritime Bee-Keepers' Association and The Newfoundland Agricultural Board.

Volume 25. SUSSEX, NEW BRUNSWICK, JULY 6, 1920. Number 20.

Farmers Should be Represented in Nova Scotia

Winnipeg's Advice That Farmers' Opportunity to Reach the Legislature Should be Disregarded---Farmers Should Insist Upon Representation

That the Winnipeg forces, presently engaged in endeavoring to organize the farmers of the Maritime Provinces in their own interests, care little about eastern representation in the legislatures of the three provinces, is painfully apparent. At a meeting in Truro, on June 9th, it was decided not to enter the local field. Why?

Long before the United Farmer movement, as directed from Winnipeg, ever reached this part of Canada, the Maritime Farmer urged the farmers of the three provinces to see that they were properly and effectually represented by candidates and to see that farmers occupied more seats in our Legislatures.

But that is not to be. Mr. John M. Pratt, who was introduced as a Saskatchewan Farmer, but who has been for years connected with the circulation department of the Grain Growers' Guide, of Winnipeg, briefly summarized the reasons for farmers organizing. If Mr. Pratt's reasons were sound, they were evidently not along the line of provincial organization.

The facts are that Winnipeg does not care a rap about the local trouble of the farmers of Nova Scotia, New Brunswick, or Prince Edward Island. It is interested in just one thing. That one thing is the price of a bushel of wheat. Every effort is being made to lead the farmers of this part of Canada to think something else. But actions speak louder than words, and every effort is being made to devote the whole organization to electing farmer candidates on the platform of the Canadian Council of Agriculture, of Winnipeg, whose fight is for the middle west and all the middle west all of the time.

But there is no good reason why the farmers of Nova Scotia should take a back seat at Mr. Pratt's suggestion. That gentleman was in New Brunswick, where he declared that the Grain Growers would spend their last dollar, in forwarding their ideals. We ask again is thee any other reason why such huge amounts are being spent in the east by the Winnipeg interests? And therefore the Maritim Farmer again urges the farmers of these parts to see that they are properly represented in the elections which are to be held in Nova Scotia.

See to it that farmers are placed on every possible ticket. The Maritime Farmer has faith in the average farmer. This paper believes that he will vote true on any question affecting the agricultural interests of his community, without any interference from Winnipeg. The absolute abandonment of the farmers to their fate in many of the Nova Scotia constituencies by the self-styled leaders, from Winnipeg, is most conclusive evidence that nothing will be done by them except in the Dominion field and in support of a policy in which no farmer from Nova Scotia ever had a say. These fellows from Winnipeg are not losing any time in gathering funds, either. Apparently this money is not to be wasted in helping farmers get to Halifax.

The Maritime Farmer has for months pointed out this feature of the Winnipeg campaign. The result pretty clearly justifies what we have said, and except in a few isolated cases, little will be done for the farmers of Nova Scotia in their own local circle.

The whole policy of Winnipeg has been to deceive. We have repeatedly exposed the attempts of the Grain Growers, now the United Farmers, to get wheat handled again this season by the government of Canada. A bill to enable this to be done was passed at the last session of Parliament. It was passed at the instigation of the Canadian Council of Agriculture, backed up by resolutions of every branch of the United Farmers of the west.

To show to what lengths the United Farmers' Guide of Moncton is prepared to go, it may be stated that in its issue of June 30th it tried to place responsibility for government control of wheat on the shoulders of Mr. R. W. E. Burnaby, of Ontario.

When the Guide did that it knew it lied. The lie is so deliberate that it is astounding. Mr. G. F. Chipman, of Winnipeg, knows that at the instigation of the Canadian Council of Agriculture, when Mr. Crerar was its president, every branch of the Western Grain Growers passed resolutions favoring government control.

The Maritime Farmer warned the eastern farmers that the adoption of any such policy should be Canada-wide and should include eastern farm products. We were denounced by men who were to profit by the deal and we warned eastern farmers that some day they would pay dearly for not insisting on the rights of eastern agriculturists. Evidently the farmers of the Maritime Provinces are waking up and now realize that they have had one put over on them. Hence the deliberate and despicable attempt to shoulder on Mr. Burnaby responsibility in which he had no share.

But the United Farmers' Guide was established to fool the farmers of the east. That is why it is controlled in Winnipeg. That is why three of its directors are Winnipeg men, with only two from eastern Canada.

It was because of this knowledge that the Maritime Farmer refused to sell to the Grain Growers' Guide, of Winnipeg. This paper is owned by local capital, and there has never been a change in the ownership of its capital stock for over eight years. The Maritime Farmer is just the same paper as it always has been. The United Farmers' Guide has a full list of its stockholders. We challenge that paper or any of its staff to come out in the open and make one suggestion of graft or wrongdoing against any stockholder in this company. If that paper will do so we will give the person concerned a chance to make good.

This paper has made some very serious charges during the past few months. We have invited our western friends to take action against us; we repeat that invitation. And we also say again that we have exposed cases in which these high-professing politicians have been robbing the farmers, while they profesesd to help them. We are willing to stand behind our statements and the trial would be before a jury of farmers.

So there is our position and that of our accusers. We defy them to make charges against any stockholders in this paper and we dare them to have what they term damnable falsehoods investigated under oath in the courts of this country. This about states as plainly as we can state, where we stand in this matter.

The Maritime Farmer, however, was not the only paper to refuse to bow to Winnipeg. In British Columbia, Winnipeg tried to buy the leading agricultural paper of that province. The deal was blocked by the farmers of the province, who declared their opposition to tieing up with Winnipeg and prevailed upon the owners to save the paper from falling into the hands of the middle west propagandists.

That the British Columbia farmers were wise has been evidenced by the move of Hon. T.A. Crerar to place apples on the free list. Apples are not grown on the prairie, so the middle western grain growers are willing and anxious to admit United States apples free of duty. British Columbia farmers, as a result, are up in arms, and declare that they will have none of it. They will not stand for it, is the way they put it, and they have served notice on Winnipeg that they are not to be fooled with anything that the Canadian Council of Agriculture has offered in the way of policy.

So we suppose that now some of the polite things that are being said about the Maritime Farmer and the indepenednt farmers of the Maritime Provinces, will be directed the way of those men in British Columbia who have sand enough to stand up for their rights, and who have no regard for the "bushel of wheat policy."

The Maritime Farmer did what the farmers of British Columbia requested of their leading agricultural paper. We refused to sell out the farmers of eastern Canada and leave them in the position of having no paper with courage enough to speak for the east.

We are straight out for farmer candidates in Nova Scotia. There is no good reason why the farmers of that province should not be represented by men who will not be dictated to by Mr. Pratt, the circulation manager of the Grain Growers' Guide, or Mr. George F. Chipman, who for the sake of the dollars necessary to carry on the policy of the Guide in support of western farmers, was willing to sell all his subscribers to men whom he described as guilty of the most serious crimes in the calendar.

The Maritime Farmer advises the farmers of Nova Scotia to disregard the advice of any but themselves. They know their wants and they should insist that despite the finding of a hand-picked convention, they are entitled to representation among the candidates being nominated in Nova Scotia.

As to how the farmers vote, we do not presume to advise any farmer as to how he shall vote. We are not a political sheet. But we do not care to etand for the stuff that Winnipeg is trying to impose on this part of Canada.

When the farmers down east come to pay their feed bills next fall they will appreciate that the warnings we have uttered are not as groundless as the United Farmers' Guide would have their readers believe.

THOSE WESTERN APPLES.

A few weeks ago we published a photograph of a page in the Grain Growers' catalogue, in which western apples were recommended as the only thing on earth to tens of thousands of western farmers. The Grain Growers are strong for things western. In the issue of the Grain Growers' Guide of May 12th an article over two pages of that paper is devoted to western apples and their superiority. As the Grain Growers' Guide remarks, referring to Okanagan apples, "these varieties are recognized as peers in the apple kingdom." Gravenstein is one of the varieties mentioned. We venture to think that with all the boosting done for western apples, a Nova Scotia Gravenstein can knock the spots off any British Columbia apple of a similar grade that can be produced. The McIntosh Red is another apple cited as being "peer in the apple kingdom." Well, the Maritime Farmer will back a good New Brunswick McIntosh against all comers. And the Maritime Farmer has been getting some free lectures for maintaining that there is such a place as eastern Canada. If the Grain Growers can exclude eastern apples from the west, they intend to do so, judging by the earnest way in which they are keeping the merits of western apples before their readers. Did somebody say something about "no east, no west, but Canada for all"? Seems we have heard something like that.

Annual Convention of the Women's Institutes of N. S.

The opening session of the seventh annual convention of the Women's Institutes of Nova Scotia was held on June 22nd, at 8.30 p.m., in the Science building of the Agricultural College, Truro, with Dr. M. Cumming in the chair.

Rev. Mr. Knott offered prayer, invoking God's blesisng on all the deliberations of the session.

D. Cumming, as principal of the Agricultural College, extended a most hearty welcome to the visiting delegates. He spoke of the sincere interest he had in the organization of Women's Institutes in Nova Scotia and of the benefits which would materially accrue to the province through the development of policies for the betterment of life in the rural dsitricts. He was pleased that the convention was metting at a time when the delegates would see the college grounds at their best and extended the freedom of the same to the members of the convention.

Mayor Coffin followed with a cordial welcome to the visitors from the town of Truro and hoped they might have a profitable session.

Mrs. A. S. MacIntosh, of Oxford, on behalf of the visiting delegation, replied to the address of welcome in a few well chosen words, and also thanking the Truro ladies for their kind hospitality. She paid tribute to the ever-ready assistance given their newly organized society in Oxford by Miss McDougall, the efficient supervison. She esteemed it a privilege to attend the convention and meet on common ground to discuss with open minds the various problems of the home life and hoped all would return home with renewed vigor and enthusiasm to live up to the Institute motto: "For Home and Country."

Mrs. J. P. Landry extended a more cordial welcome from the Bible Hill Institute, which welcome at the close of her remarks, took the tangible form of a very delicious lunch, served by the ladies of said Institute, in the course of which ample opportunity was given to mingle in a social way, meeting new and renewing old acquaintances. The meeting then closed with the singing of the National Anthem.

Wednesday Morning.

The wednesday morning meeting opened by the singing of the Institute ode. Miss McDougall, supervisor of Women's Institutes, in the chair.

The first business was the appointing of Mrs. Hatfield, of Berwick, as secretary of the convention. Then followed the reading of reports from the various Institutes. These reports were commendable for the concise manner in which they were presented, a feature worthy of note in a gathering where of necessity so many reports have to be gone over. The work reported brought to mind, very forcibly, the great power for good and the real improvement in rural conditionas which is being wrought throughout Nova Scotia by the Women's Institutes. Thirteen of the Institutes reporting are yet in their infancy but the amount of work already acomplished was amazing. Nearly all of the societies are working for betterment of conditions in the schools, looking after the sanitary conditions, inteersting the children in school gardens, and as in the case of Acadia, providing the seeds for this work and also providing an open air rink.

Aspen and Glenelg memhers all belong to one congregation and are buying a new organ for their church. They meet at the homes of the various members. Tea is served, for which they charge 25 cents, which is added regularly to their funds.

Barss' Corner reported an increase in membership. They work for a school exhibition to be held in September, also for repairs to their hall. An autograph quilt made to raise money, and the doing of considerable beneficient work,, contributing to the Salvation Army drive, etc. They also reported having a good circulating library.

Berwick has affiliated with the Local Council of Women, and in this way extended their community work. They have interested themselves in the welfare of th feeble-minded children n thieir community, have taken up work among the schools and are now taking the school census. They also have decided to help establish community singing in their district.

Bear River, although only three months' old, is very active. They are particularly active in bettering school conditions. They interviewed the school trustees nd appointed a committee to meet with them each month. Now they are working hard to procure fire escapes for the schools. At the request of the Soldiers' Settlement Board they are interesting themselves in the new settlers in thir midst and will hold a reception for them during the next week, as a means of getting better acquainted. They applied to McGill for a ravelling library and by paying a small sum extra have secured a wider range of subjects. Each member has donated one volume which now gave them a spelndid circulating library in their town. They are trying in every way to better the social life of their community.

Bridgewater reported considerable hospital work, the preparing of the necessary linen. They also are ready to furnish one room. While they have closed their meetings for the summer, each member is pledged to earn $2.00 to be contributed to the funds before the beginning of the fall meetings.

Caledonia is interested largely in school work and are prepared to take up a modern health crusade at the beginning of the next term. When questioned regarding this it was explained that the literature in regard to this modern health crusade could be obtained from the Dalhousie hospital branch.

Canning Institute is taking an active interest in the school garden and school exhibition. A skating rink has been obtained in which the Institute has taken stock. The condition of the poor house has been looked into and donations given. They are now doing war memorial work and hope to raise $1000 for this object.

Cambridge Station, a new Institute, reported making application for a McGill travelling library and are planning to improve the school property.

East Leicester has made many improvements in the social life of the community and are now to meet with the Local Council for the purpose of making plans for the improvement of the cemetery.

Grand Pre Institute has accomplished much work in the schools, sent donations to the Infants' Home in Halifax and have met with the Local Council to plan the betterment of conditions in the poor house.

Gaspereau, a new society, reported the valued assistance which Miss Stuart of Grand Pre had rendered them. Much progress has been made in the improvement of sanitary conditions in the schools.

Glace Bay, also a newly organized society, has established the Victorian Order of Nurses and are financing the same. Each member pledged 25 cents a month. They also have received generous donations from various other societies in Glace Bay towards this purpose. The sanitary conditions of the jail are also receiving attention.

Halfway Brook has concentrated efforts towards a new chlurch in their community, all members being of one denomination.

Hantsport reported splendid community work accomplished. They have a committee meeting with the Town Council to improve conditions of their cemetery. They also have a committee to meet with the Board of Trade re the improvement of sidewalks. The Children's Aid Society has their undivided support.

Indian Brook has chiefly worked in the school, donating $10 toward a school library and offering prizes for school garden work.

Lakeville reported splendid work done in their community in relief of the needy and in the improvement of life of their community.

Lawrencetown reported as their chief work an interest in the schools. Pictures, among the world's best subjects, have been bought for the schools. They are now agitating for supervised play grounds, the ladies of the town having volunteered two afternoons each week to carry out this plan. They have a good circulating library and have purchased a piano.

Medford reported an improvement in the social life of their district, interesting meetings are held. The child welfare problem being of paramount interest.

Maplewood has purchased an aisle carpet for the church, raised money by two autograph quilts, did considerable children's sewing, helped with school exhibition last year, and improved local conditions generally.

Millville in common with the other branch societies of which they are a part are working for the new church and improving the cemetery.

Mahone Bay Institute members are putting forth their best efforts towards the erecting of a suitable memorial for the brave boys from their community. They are planning for a big money-making day towards this end on July 1st.

Brookfield reported a committee visiting the schools and looking into conditions each month. Preparations are under war for a school fair this year. Two magazines are taken which go the rounds of the community. They also had a McGill travelling library.

Oxford, which boasts the largest membership, has a committee looking into the various needs of the schools and reporting the same. They serve hot soup and cocoa at the noon hour in the schools during the winter months, which is most gratefully appreciated. They also offer prizes for certain fsubjects. A number of needy families have been helped and donations have been sent to the Amherst hospital. A Victory bond of $500 has been purchased by this progressive Institute. Much of the credit for the splendid work accomplished is due to the untiring energy of their president, Mrs. MacIntosh.

Paradise reported a McGill library started and much done in the improvement of conditions in the rural schools. Now their energies are toward the improvement of their cemetery.

Port Maitland has also done considerable work among the schools, has bought an equipment for their kitchen and provided sign boards for the many dangerous places encountered in travelilng the roads. Tea is served for 10 cents, thus constantly adding to their funds.

Riverside, another branch of the Stewiacke, has been working principally for the new church. They are now fixing up their cemetery. A donation has been given to the Armenian Relief.

The Supervisor's Report.

The reports were then laid aside for the morning and the Supervisor submitted her report for the year. There are now 64 Institutes in Nova Scotia, which, with the loss of two from the 53 reported last year, makes 13 new Institutes organized this year. Ten of these were organized by Miss McDougall. Total membership 1567. During the past year the sum of $10,000 was raised. Thirty-five of the Institutes were personally visited during the year.

Miss McDougall paid tribute to the splendid assistance given her by Miss Campbell, of Grand Pre, and Miss Hyson, of Lunenburg. During the winter 10 courses in home nursing had been arranged for in connection with the St. John Ambulance Soceity, which had proved highly instructive. Two hundred and fortyo-ne had registered for these courses.

She told of her visti to the New Brunswick Institute convention of last fall; also of attending the Federation in Toronto in November. Plans were under way this summer for demonstrations in canning, also for a short course to be held the first of July for girls in the teen age.

Miss McDougall urged that the Institutes would see that the girls take advantage of these courses, which will be so beneficial to them.

She also urged the Institutes not to be too materialistic, not to think that because their funds were low that they are doing nothing, but to always remember there are thing of infinitely more value than money. And lastly to send in their reports regularly each month to her as it was the only way she could know just what they we re doing.

After a short discussion on various phases of the work brought forth in this interesting report, a nominating committee of three was appointed by the chair: Convenor, Mrs. Hamilton, Mahone Bay; Mrs. MacIntosh, Oxford; Mrs. Jackson, North Sydney.

The meeting then adjourned.

Wednesday Afternoon.

Supervisor in the chair. Reports of Institutes resumed.

Round Hill reported active meetings, work done on their cemetery and considerable energy expnded on momerial work.

Scotia Village found their meetings very helpful and had taken advantage of the home nursing class. They were now turning their attention to the painting and repairing of their public hall.

Scotsburn has assisted a number of families belonging to returned soldiers that were in need of help. They have renovated the hall and bought chairs for same. They also have taken up work in the schools.

Southside Branch of the Stewiacke are working for the new church practially to the exclusion of all else, although they are now looking into the condition of the cemetery.

Sheffield Mills has done considerable sewing for some needy families of the neighborhood and gave a Christmas treat to the children. Doinations had been sent by them to the Infants' Home in Halifax. Community work has been taken up through voluntary offerings by the members. Money has been raised to paint the walls and ceilings of the primary department of their school. They have also been instrumental in having some road work done, cleaning the sides, etc.

Tatamagouche reported social life in their community very active. They have purchased books for the school library, improved the condition of their sidewalks, had a clean-up-week and appointed a committee to see that these streets are kept clean.

Upper North Sydney has made several improvements in their school property and are now improving their institute building. They have decided to affiliate with the Women's Council.

West Brook has made improve-

ments in both church and cemetery grounds, has built an extension to the school house for a library and interested themselves in school work generally. Donated, too, a good circulating library like may of their sister institutes.

West Gore society found their meetings foth interesting from the social standpoint, and profitable. Many interesting features of their meetings were spoken of, among which perhaps the outstanding was the passing of a resolution to use only 1 lb. of sugar per week to a family of five during the present excessively high prices. This was being religiously carried out and none seem to be suffering in consequence.

Westville reported improvements made on their school house and work along the same line being now carried on in their hall.

St. Andrews reported a new school building had been erected in which they are taking a deep interest and an advance made along all social lines in their community.

Bridgetown reported the play grounds they had started last year a great success and that they were to have supervised play grounds this summer. A drinking fountain has been placed in the school grounds, and much work done in the homes of the needy in the way of providing comforts and little pleasures at the Christmas season.

Port Williams reported an active society, doing good work for the Infant's Home, Halifax, and other worthy subjects, school exhibition work and help given in teaching the girls to sew. The ladies giving two afternoons a week for this purpose. The outfitting of dolls for an exhibition, providing the necessary work on which the children could learn the different stitches.

This finished the reports of the different institutes represented.

A very interesting letter was then read by Mrs. Walker, telling of the extreme suffering in Austria and the great need for reels of cotton and bandages. This was a personal letter but it awakened much interest and many donated voluntarily money with which to buy reels of cotton to send for relief.

Miss MeCain, Supervisor of Women's Institutes for New Brunswick, who was to have brought greetings from her province, was unable to be present, owing to the recent death of her father.

Miss Saunders, Superintendent of Women's Institutes for Prince Edward Island, brought greetings from the Garden of the Gulf, and told of the work being carried on by their various societies.

School improvements were commanding the greatest interest and wonders had been done in remodelling school grounds, planting trees and teaching the children to take pride in their school, planting trees and instilling in the children a pride in their school property. The sanitary conditions of the schools sadly needed attention and a committee was appointed to see that this state of affairs was remedied. The open bucket had been done away with and in some cases pumps put in the school rooms. Prizes were offered for the school fairs. In some places hot lunches had been served at noon to the children during the cold weather. Membtrs of the Institutes were put on the school boards in many places.

Some institutes built rooms and bought equipment, some bought organs or pianos. Cemeteries were improved and a general cleaning up of the towns was started with prizes offered for the best kept grounds. War memorial work had also been taken up.

Much was accomplished and better work was well under way for this year.

Miss Saunders, in closing, wished the Nova Scotia Institutes a prosperous and successful year.

Miss Jennie Fraser, for many years the Superintendent of Women's Institutes in Nova Scotia, was the next speaker. She expressed her great pleasure at seeing once more those with whom she had been in former years so closely associated. She could see considerable growth in the work since she had left and the thing that interested her very much among the reports was the mention of community singing. She had the pleasure whlle at McDonald College, of attending a demonstration on communlty singing and folk dancing given there by an American.

She thought the possibilities ln connection with the practice of community singing were unlimited and that too much stress could not be laid on its revival. She had often heard her father say "Social life in the country died when community singing went out."

In regard to child welfare, she thought when the state had taken it up the Institute cannot afford but to be interested.

A very interesting report was read by Miss Annie Stuart, of Grand Pre, of the first convention of the Federation of Women's Institutes, which will be published in full in the next issue of the Maritime Farmer.

Dr. MacMurchy then brought up a discussion on the letter from Vienna read by Mrs. Walker and sald she shought something definite should be done in regard to sending bandages and reels of cotton to the sufferers in Austria.

In the rolling of bandages, Dr. MacMurchy sald, perhaps it would be a help to know that the cotton could be rolled in any length and then cut with a carving knife in 2½ inch widths. This simplified the work connected with the making of these bandages. It was then moved by Mrs. Lovitt, of Bear River, and seconded by Mrs. Hamilton, of Mahone Bay, that a subscriptoin list should be opened to raise funds for this worthy object, Mrs. Walker to be the recipient of these funds and attend to the buying of the reels.

An address was then given by Mrs. ohn Stanfield, Truro, on "The Value of the Library." Mrs. Stanfield welcomed the visiting delegation in the name of the Woemn's Council of Truro, in the absence of the president of that organization, and gave a short outline of the work carried on by the Council among the girls in the factories of the town, in the way of social evenings given them, etc., and also along the lines of child welfare. A number of children had been outfitted for school, who otherwise would have had to stay at home. They had secured the services of the dentists of the town to look after the teeth of children whose parents could not afford the necessary expense.

Taking up the subject of her address Mrs. Stanfield told of the beginning of the public libraries of our land and the system by which this work is carried on, and its development. The late Andrew Carnegie chose free libraries to improve the mass of people. We must dismiss the idea that a library is only a collection of books for students. It places before the individual what will apply best to his need and adds happiness to the community at large. Teaching the children to read without providing proper readlng material is absurd. A good library cannot fail to be a benefit. All cannot afford a private library and a community library benefits all.

This interesting address brought forth some discussion on a subject in which all seemed interested. Miss Fraser, of New Glasgow, Mrs. Staddard, of Lawrencetown, and Mrs. Stanfield, told of how the libraries had started in their home community, some just through the donations of individuals, and of the happiness brought to many homes by these libraries.

This finishing the afternoon programme, the meeting adjourned.

(Continued on page 760.)

How to Use the Common Potato Poisons

By Geo. E. Sanders, Dominion Entomological Laboratory
Annapolis Royal, N. S.

Poisons for the potato are divided into two groups, one of which groups is safe when used straight or alone on potato foliage, and the other safe only when used in a particular manner in Bordeaux mixture.

The poisons of the first group as a rule cost more than those in the second, as they are more expensive to manufacture. The following table gives names of the poisons which are safe when used alone on potato foliage and the amount that should be used in 100 gallons of solution:

Dry arsenate of lead, 5 lbs. per 100 gallons.

Paste arsenate of lead, 10 lbs. per 100 gallons.

Paris green, 2½ lbs. per 100 gallons.

Arsenate of zinc, 3½ lbs. to 100 gallons.

Arsenate of lime, 4 lbs. per 100 gallons.

These amounts all give one pound of metallic arsenic in 100 gallons of water.

These are absolutely the only poisons that are generally available that can be used straight or alone on potato foliage. Of this group Paris green may occasionally give some slight burning. They are arranged in descending order of cost, taking prices generally, the dry arsenate of lead usually costing the most, while arsenate of lime is almost invariably the cheapest poison in this group.

The second group of poisons enumerated below, must never be used excepting in combination with Bordeaux mixture. The weight given opposite to them given from three-quarters to one pound of metaillic arsenic per gallon of Bordeaux mixture.

Sodium arsenate (arsenoid and solarsate) 3 lbs. per 100 gallons.

London purple, 3½ lbs. per 100 gallons.

Solium arsenite (handy killer), 3½ lbs. per 100 gallons.

White arsenic, 1 lb. per 100 gallons.

The poisons in this group are cheaper than those in the first group and generally will kill very much more rapidly. When used alone they will destroy foliage, but when used properly in Bordeaux, they can be made both safe and efficient. Each of them needs to be used in a particular manner and when the saving which results from their use is considered, it seems well worth the while of the largest growers to learn how to use these cheap and effcive poisons.

Sodium Arsenate.
(Arsenoid or Sol-Arsato)

This poison is entirely soluble and for 100 gallons of Bordeaux, three pounds of poison should be dissolved and poured either into the lime solution before making Bordeaux, or poured into the completed Bordeaux. This is done in order to cause the arsenate to combine with the lime rather than the copper. Combining an arsenate with copper has a tendency to make the arsenic slow in its action on insects.

London Purple.

This is one of the old poisons which is comfing back into use in several sections. It is really an arsenite of lime and while not wholly soluble will give quite serious burning, as a rule. To use London purple it should be dumped into the water intended for a stock solution of copper sulphate and the copper sulphate dissolved into the poison and water. Three and one-half pounds of London purple should be put in ten gallons of coarse crystal copper sulphate dissolved into this mixture. After stirring this should be used in the same manner as any other stock solution and in combination with the proper lime solution. This will give a very safe and effective poison.

Sodium Arsenite.

This material is made and sold in New Brunswick in bottles under the name of Handy Killer. To be absolutely safe, this should be put into the water intended for a stock solution of copper sulphate, and the sulphate dissolved into it ln the same way as described for London purple. The stock solution and the Bordeaux which will result after the lime is added will be green instead of blue.

As asrenite of sode (Handy Killer) is entirely in solution, a fairly complete combination with the copper may be effected by pouring the poison into the copper slphate solution a few minutes before making the Bordeaux and stirring rapidly. This will give a green stock solution as described above. In order to have the cheaper arsenites safe in Bordeaux, the stock solution and the Bordeaux made after the lime is added must be green and not blu.

White Arsenic.

The formula given below which enables growers to use this base or raw product is that worked out by Mr. A. Kelsall and the writer during the past three years.

White arsenic must be used exactly according to directions and is one of the safest, most lasting and effective, as well as the cheapest of poisons if the simple directions are followed:

1. White arsenic must be ground finely enough to pass a two hundred and fifty mesh screen, and must be mixed with an equal weight of hydrated lime, when dry, in order to make it wettable.

2. To each ten gallons of water intended for copper solphate or bluestone stock solution, stir in two pounds of the mixture made up of one pound of white arsenic and one pound of hydrated lime.

3. In each ten gallons of water containing the poison and intended for stock solution, hang a bag of coarse crystal copper sulphate at the top of the water. The copper sulphur must be dissolved into the poison ln the stock solution. Stir occasionally while the copper sulphate is dissolving.

4. Use this green stock solution just exactly as any other stock solution of copper sulphate in making Bordeaux. Stir before dipping out. Dilute it before adding it to the dilute soultion. Use the usual quaniity of lime regardless of the lime that was mixed with the white arsenic.

The Bordeaux made in his manner with white arsenic will be green and

(Continued on page 766)

Gleanings of Agricultural Progress in New Brunswick

Investigational work carried on by the New Brunswick Department of Agriculture has shown the very great need of lime on the majority of the soils in the province. It is a surprising fact that tests have shown it would require from two to three tons of ground limestone to neutralize the acidity per acre of ground in the various counties of the province.

The following table shows the requirements as determined by a number of tests of representative soils in various parts of each county:—

County	No. soils tested	Lbs. limestone required per acre
Restigouche	3	5150
Gloucester	42	5683
Northumberland ..	30	4085
Kent	20	4681
Kings	44	5690
Albert	10	6690
Queens	8	6262
York	25	6326
Carleton	35	6553
Victoria	29	5876

It can be seen from this table that not less than two tons per acre should be used and better two and one-half tons when applying ground limestone.

With this information before him, the Minister of Agriculture, the Hon. J. F. Tweeddale, decided that the question of supplying cheap ground limestone to the farmers of the province was one of the important things to be considered. If lime could be placed within the reach of farmers at a reasonable price, it would mean a big increase in the crop production of the province. It would mean that the clover acreage would be increased and grown much more successfully. To the man raising potatoes, or dairy farming, or, in fact, doing any kind of farming, this would be a very practical benefit and work out in profits of dollars and cents to all using the lime.

A survey of the lime deposits of the province revealed the fact that abundant supplies of high grade lime were available, the largest deposit being in St. John County. The lime in this district is also of high quality, testing 94% Carbonate of Lime. It was finally decided by the Hon. Mr. Tweeddale, because of the unlimited quantities available at this point and the high quality of the material, to establish the plant at Brookville, St. John County.

Satisfactory arrangements were made by the Minister with the Railways in regard to the matter of freight rates, which solved one of the big problems that faces the working out of a lime policy in any country, namely, that of economic transportation. It must essentially be delivered to the farmers at a low cost, in order that they can use it in the quantities required. Frequently in other provinces and States of the Union the transportation has cost more than the lime; in which cases the cost often runs up to a prohibitive figure when it is delivered.

A definite contract has been entered into with Messrs. Smith & Merrithew, Limited, Brookville, St. John County, to supply ground limestone to the farmers at $5.00 per ton in bulk, car lots, delivered, freight prepaid to any station on the C. P. R. or C. N. R. lines in the prvince. If put up in bags the cost of bags and bagging to be charged extra. They are now booking orders for summer and fall delivery. One of the most modern lime-crushing plants in America is being placed at Brookville. This plant consists of a large preliminary crusher through which the rock is put as it comes from the quarry. The broken material then passes direct from this into a large roller-process grinder, which grinds down to the required fineness. The material can be run from this directly into the cars or into a large storage bin as required. The plant has a capacity of 80 tons per day and will be in operation early in July. A 75 h.p. electric motor supplies the power.

Farmers' organizations, Agricultural Societies or individual farmers may place their orders with the Smith & Merrithew Company, Brookville. Orders may also be placed with the Dept. of Agriculture, Fredericton, who will forward them to the company. The company having agreed to fill them up to the full capacity of the plant. Delivery will be started as soon as the plant begins operations. Terms will be sight draft attached to bill of lading, which means cash upon the arrival of the car.

Farmers will appreciate this opportunity of getting any quantity of limestone and delivered to them at as low a cost as $5.00 per ton. At that price it will be widely used and the results from its use will speak for themselves.

In conclusion, in regard to the use of lime, this might be said: Probably its most important function is in acting as a neutralizer of soil acidity and thus make soil conditions more favorable for crop production. To some extent it does act as a liberator of plant food, which is locked up in the soil, both potash and phosphoric acid. It is thus a very valuable indirect fertilizer. Its effects in putting the soil in the best possible conditions to make the best use of fertilizers and manures is unquestioned. It also puts the soil in condition to grow clover, which is one of our best soil fertility building crops. By this means it becomes possible to add considerable humus to our soils and increase their productive capacity. Farmers thus should not look upon it as an element that can replace entirely the fertilizer and manure which they are using, because in itself it is not a direct fertilizer. The incorportion of clover roots in soil and the sweetening of soil will, however, make it possible to reduce somewhat the amount of fertilizer used and get as good results. It will thus increase crop production at a considerable saving to the farmer. Practical tests made by farmers in different parts of the province have shown its vlaue. Ask any farmer who has used lime on his farm and he will tell you of the marked results obtained. The farmer who maintains the fertility of his soil and its humus content, and keeps it sweet by the use of lime, will find his crops responding to such treatment and the yield per acre brought up to a very high standard.

CO-OPERATIVE MARKETING OF WOOOL IN NEW BRUNSWICK

From all indications, 1920, will be a banner year in the co-operative marketing of wool in New Brunswick. At the phesent time, the wool market is very weak, with very little demand for wool. Local buyers are paying from 16c to 25c per lb. Although this looks bad for the flock owner, it is haped that these conditions are only temporary, and that wool will be selling at about normal price in 2 months, after the bulk of the wool has been placed on the market. With these conditions prevailing, the farmer who markets his wool co-operatively is sure to come out a winner, as all wool marketed in this way is handled by the Canadian Co-operative Wool Growers Association, which is a Dominion wide company, handling the bulk of Canadian Wool, and is therefore in touch with the latest market conditions and able to demand the highest price.

Due to a backward spring followed by continued dry weather, wool raisers have beena little slow in shipping to the grading station at Fredericton. Nevertheless, wool has been coming in very rapidly in the past week, and now over 50,000 lbs. have been received. It is expected that between 40,000 and 50,000 lbs. more will be received in the course of the next week or 10 days. The time limit for receiving wool is June 25th.

James D. Thompson, Expert Wool Grader, Livestock Division, Ottawa, arrived at Fredericton on June 10th, and grading commenced the following day. A. E. McLaurin, of the Livestock Division, Ottawa, who is supervising wool grading in Canada was at Fredericton at the same time, and stated tht he considered the Warehouse, which is situated in the rear of the Main Fredericton Exhibition Building, a very fine one. If you have not shipped your wool, do so at once.

Notes From the Nova Scotia Agricultural College

TIMELY HINTS TO CREAMERY PATRONS

These are the days when the creamery manager's peck of troubles is full to overflowing. Late June and early July give him the most difficult period in the year's operations. Nearly all creameries are really undermanned, so that every member of the staff is as busy as he can be. The cream supply is at its height. The butter at this season is being put away for next winter's use, and must be at its best in quality.

This, then, is the time when the cooperation of the patron is most necessary. In the hot weather the cream quickly sours unless special precautions are taken to keep it sweet. Sour cream not only does not make as good butter, but it is practically impossible for the manager to get samples for testing. Consequently there are more complaints of variation in cream tests than at any other season.

The patron who has ice and uses it is fortunate. The main matter is to keep the cream sweet. Delivery should be frequent enough to give it a chance. Aove all else the main principles to be observed are in the words CLEAN and COOL. The milk or cream should be cooled to a temperature eblow 55 degrees as quickly as possible after milking.

This whole question is clearly outlined in two bulletins which may be obtained from any creamery manager, entitled "Care of Cream for Butter Making", and, "Causes of Variation in Percentage of Fat". A little time spent in the reading of these will add to the quality of the cream, reduce the manager's peck of troulebs, and make the business more profitable and satisfactory, if acted upon. If the bulletins are not on hand at the creamery, drop a card to Dairy Division, Agricultural College, Truro, and you will receive copies by return mail.

WOMEN'S INSTITUTE CONVENTION

The Seventh Annual Convention of Women's Institute workers was a most successful gathering. Reports of the past year's work indicated untiring activity all along the line. The ideals of the Institute are being worked out in a great many communities along the lines of greatest need. Thirteen new Institutes have been organized since last October.

Seventy-five delegates were present at this convention. All were proud of the work done and enthusiastic in planning for the future. Several of the addresses were worthy of a verbatim report to the general public. The main tendency of the plans for the future is toward a greater cohesiveness within the organization, and a more definite continuity of work between conventions. To secure these ends standing committees were appointed on Education, Health, Publicity, Home Economics, Legislation, Agriculture and Finance.

FIELD CROPS COMPETITIONS.

Farmers intending to enter the Field Crops Competitions in Nova Scotia are reminded that entries must be made beofre August 1st. Bulletins giving necessary information may be obtained by writing Mr. F. L. Fuller, Agricultural College, Truro.

The new features appearing in this year's announcements are, (1) a competition in clover growing for seed in each county where gve or more entries offer. The area required is a half acre under either first or second crop. By the time this issue reaches its readers it will be rather late to risk preparing for a second crop, as the first crop should be cleared away by the 25th of June, over most of the province. If this has not been already done the first crop must be allowed to mature.

2. A special competition for encouraging the production of seed oats. The terms of this competition run as follows:

Competition to include two or more districts.

District No. 1—Antigonish county and that portion of Pictou county east of West River.

District No. 2—The remainder of Pictou county and that portion of Colchester county lying north of the Canadian National Railway and Cumberland county.

Other counties or districts securing the necesasry number of entries and making application for competition may be considered.

Five acres all of one variety to be seeded with approved seed.

To qualify for competition there must be ten or more entries in each district. Entries free.

Competitors may enter both the regular Field Crops Competition and the Special Seed Oats Competition, but winners of prizes in the Special Compeition cannot receive prizes in the regular Field Crops Competition.

The prizes for the field scores in each district will be as follows: 1st, $25.00; 2nd, $20.00; 3rd, $15 00; 4th, $10.00; 5th, $5.00.

Additional and equal prizes will be awarded for 1½ bushel samples shown at Maritime Winter Fair or subsequent Seed Fair held in the district. Total product of field must be offered for sale and sample shown at Seed Fair must be representative of total product as certified by Inspector of Seed Branch.

Competitors failing to win a prize in the field score in this competition are eligible to compete for prizes at Seed Fair.

WOOL MARKET AT PRESENT UNSATISFACTORY.

Very small quantities of wool are now selling in the big markets of the world. As a result the Canadian Co-operative Wool Growers, Ltd., have been compelled to reduce their first payment on wool collected at receiving stations to 15c. per lb. However, it is quite possible that the second payment will be much larger than the first.

In the first place, May and June are always depressed months in wool marketing, recovery taking place later in the season. Then, the fact that the Canadian Co-operative will have on hand a thoroughly graded lot of wool to sell when the market gathers strength will give them a decided advantage. Hence, although farmers may be disappointed in the original advance made, they may reasonably expect a decided improvement when the wool is finally placed on the open market.

Just now manufacturers are believed to be heavily stocked with high priced wool, and are hoping to recover themselves by buying at decidedly lower prices. Those who adopt the heretofore prevalent practice of selling outright to local buyers at once are likely to lose out. Those who market co-operatively and wait for future developments have every reason to expect just as much better results proportionatly as in the past three or four years.

Your correspondent has clipped the following from the market section of a big Toronto paper: "If anything will save the producer from the vicissitudes of exploitation on a falling market it will be the system of co-operative marketing on the basis of scientific grading and selling in large bulk. Standing alone farmers would have to accept the offers which dealers might care to make them, but selling co-operatively they are able to sell direct to manufacturers, and get whatever the wool is worth on a manufacturing basis. After all, the wool must go to the manufacturers, and they will pay no more than they have to for it; thus they will try to buy as cheaply from a leader as from the co-operative sellers, and the dealers' profit must come out of the wool."

THE VALUE OF PRESS NOTES.

Following a short note recently issued in this paper, and in the press of Nova Scotia, calling attention to the necessity of beginning to spray potattoes with Bordeaux mixture for the prevention of rot by thre first week in July, no less than seven letters were received in a single mail at the office of the Secretary for Agriculture, asking for detailed information on this important matter. This indicates two noteworthy facts, viz:

1. That articles containing useful agricultural information are being read and appreciated by our farming population.

2. That a very considerable number of people in the province have made up their minds to begin this year the practice of spraying for the prevention of rot, a measure of incalculable value.

Reports from some sections are to the effect that supplies of the necessary materials may run low. Farmers will be well advised to place their orders early therefore. Those who cannot get supplies locally will be directed to sources of supply if they write to the Department of Agriculture, Truro.

FOR SALE AFTER JULY

Pure Bred Holstein Bull, 3 years old (No. 32708); dam of this Bull tested 5% butter fat. Enquire

N. S. EGG LAYING CONTEST.

Such splendid results have been achieved to date in the First Nova Scotia Egg Laying contest, and such interest manifected, that the management of the Poultry Departmentment at he Agricultural College have made arrangements for a second year. Announcements are now ready and will go out to poultry clubs, etc. One of the new fetaures in the second year of the contest is the opportunity of any owner of a pen of birds to send a suitable male bird to mate with his pen. Thus opportunity will be offered to secure the best possible laying strain under the most favorable conditions.

As in the first year of the competition the number of pens is limited to thirty. Interested parties should write at once as the space is likely to be snatched up very quickly.

DAIRY PROGRESS IN CAPE BRETON.

Dairy Superintendent McKay has recently returned from an extended visit to the creameries and some of the larger dairy farms in Cape Breton. He reports that both the Baddeck and Margaree creameries have greatly increased their business this year over last.

The prospects of the proposed new creamery at Port Hawkesbury are very bright. A site will soon be settled upon and work begun. It is hoped that the plant will be ready to begin operations at the opening of the season of 1921, probably my May 1st.

Some splendid dairy herds have been developed in Cape Breton in recent years. Among these is one of pure bred Guernseys owned by Mr. H. C. Corsion at South Ingonish. Mr. Corsion is a wealthy American manufacturer who has for many years spent his summers at beautiful Middle Head. He has done a fine piece of work in demonstrating what can be done in the way of dairying even in outlying districts. The weekly shipment of butter from his herd is now 200 lbs. All in all dairy prospects in Cape Breton are very encouraging.

HANDLING CLODDY SOIL.

Of all the things I ever abhored in the making of a seedbed it was that of the difficulty in handling clods. Clods are not a very good indication of proper tillage methods, but occasionally we get a few of them under certain conditions and they say we'll never let it happen again when starting out to pulverize the clods.

In plowing the driest and hardest soil where clods turn up it will be noticed that the clods, and all the dirt turned over in fact, are a little moistre than they will be the next day. As soon as the clods are turned up with the plow capillary action is cut off and the lumps begin to dry out rapidly with the increased surface exposed to the air. The time to tackle those clods is just as soon after plowing as it can be done rather than to wait for a rain to soften them. A disc harrow while cutting them in pieces will also pulverize many of them if harrowed while freshly plowed.

be a nuisance all summer etaosihrdlu

If clods are not broken before the corn or other crop is put in they will be a nuisance all summer, interfering with harrowing and the cultivation. Summer rain and the rollign about over the land with the cultivators will tend to wear down clods before the time to sow wheat but yet you will find a big clod still left to interfere with the wheat drills. Clods even as small as your fists are always rolling over onto the young corn, sometimes breaking it off or covering it.

Thorough preparation is urged for several reasons. It is one of the ways of getting rid of clods. If you don't get rid of them before planting it will be a good deal bigger job trying to get rid of them after planting. The roller, culti-packer, disc harrow, and drag are about the best tools to handle clods with. You can cut, crush, or break them, which ever proves the most effective. It takes a great deal of work and persistent effort to handle them properly.

I have seen many farmers plow all their land before ever putting a pulverizing tool on it. There may be three weeks pass beofre a foot of soil is worked. Perhaps a half of their land will be pulverized in fine shape and the rest a mass of clods. The best plan I have ever found of avoiding these clods is to put the pulverizer on just as soon as the soil will work nicely. This may be the next day, or within a few hours. A good practice is to unhitch from the plow early enough in the afternoon to drag or harrow all that was broken that day. This is a pretty sure way of detecting clods. Soil seldom works up best immediately after being turned, but after a few hours exposure to the sun and air it pulvrizes finely.

When soil is plowed too wet clods are exceedingly hard to combat unless the soil contains plenty of humus or is sandy. The best advice that can be given in this case is to quit plowing, wait until it turns ocver less compactly. Plowing land too wet tends to pack the poil, while plowing when the soil is drier or in the right condition produces just the opposite effect. The furrow slice when turned over should break and settle in a loose mass when soil conditions are favorable.

If clods turn up where cattle have tramped duirng wet ewather or wagons have crossed, break them up before they become hard and unmanageable. Hauling over wet fields or allowing live stock out on the fields when soft is favorable to clod formation. It is a good deal easier to avoid the clods than to try to get rid of them. But it pays to get rid of them before planing your crop.

There is a good point in tractor farming, you must not go on your land while it is soft. With a tractor you do not need to, you have plenty of power and can defer plowing until plowing conditions are exactly right.

TYPE IN BREEDING.

Form and function are co-ordinated in dairy cattle. The vitality and high production of our cattle result from their form and functional development, and these are the results of thousands of years of favorable environment with selective breeding. These things constitute the pure-bred of today and thus there come to your hands these wonderful instruemnts, the work of untold generations who have gone before. The type of the pure-bred as so devloped should be approached with reverence. No hasty hand should seek to radically after the type so attained and which is so correctly indicated in our scale of points. But danger there is, and lamentable as may be the fact, that in the hands of most owners a retrograde movement sets in, due to our own carelessnes sand neglect or perhaps the striving after false ideals.

Be again reminded that you must ever keep in mind an ideal in your breeding operations which shall ever consist of the trye type of the breed, and not neglect proper and liberal feeding as the essential accompaniment to your efforts.

FOR THE LOOKS OF THINGS.

How much is a man to be judged by the appearance of his surroundings? How much is a community benefited by the neat appearance of the farms? These are questions which may be purely speculative but which leave a strong impression on the visitor. One of the things which strikes the visitor in a prosperous dairy community is the fine appearance of the farm buildings. He thinks at once "here must be a prosperous country." When one travels through some sections he gets a very strong impressions but in exactly the opposite direction. The unpainted barns and general appearance of neglect go together and the visitor gets the impression that either the land is too poor to support well built and well kept premises or the people have no pride in these things.

This condition misrepresents the value of the country and the thrift of the people. A little money spent in paint and in keeping the place in order would add actual cash value to the dalry farms along the St. Lawrence Valley. These things are a matter of habit and if a few men would fix up their places nearly everyone else would follow.

One reason for the genereal lack of paint on all buildings but the dwellings is that they are built of rough sawed lumber, and the practlce of leaving such buildings unpainted started years ago when lumber was cheap and there seemed to be no real economic value in paint. That day has passed and a few farmers are using paint even on this rough lumber, adding many dollars to the appearance of their farms.

The looks of the farm has another value which is more important than the mere money value. It is due the children on the farm that they be given a chance to grow up in pleasant and inspiring surroundings. Youth is usually responsive to the beautiful. If they are going to be made to like the country and stay in it, one of the factors is to make it beautiful by harmonizing the work of man with the work of nature.

Too little attention is given to these things on the farm. Utility is necessary, but it is not necessary to sacrifice beauty and harmony for utility. The two can very well go together.

Well kept lawns, fances kept ship-shape, paint on the buildings, shade trees and flowers, are all things easily obtainable, and add not only to the actual value of a farm and a community where every one looks after these things, but it adds to the well being and satisfaction of living in such a place. There are some men who would be content to sleep in the hog pen if by so doing thy could make a dollar or escape the spending of one, but the women and children almost without exception crave. the beautiful and treasure every opportunity to make the place in which they live a fit place for humans to live.

MORE WORK.

Laborers of the city are trying to meet the high cost of living by asking for increased pay. But they forget that an increase in wages is only intensifying the present conditoni and will occomplish nothing but to further advance prices.

We must ever bear in mind that money does not feed or clothe the nation. If we want more food, more clothes, more homes, more of all commdities, more work must be done. Work is the solution of our high cost of living—not higher wages or shorter hours.

Professor H. C. Filley, Chairman of the University of Nebraska Department of Rrural Economics, recently stated:

"If plumbers, painters, and carpenters receive $1 to $1.25 an hour, the farmer must pay equivalent wages or limit his farm operations to the work which can be done by himself and family. When he recalls the efforts made to compel dairy farmers to sell milk at less than cost of production, the drive on food prices, the losses incurred by feeders due to the sudden decline in the price of live stock, and the continued increase in the price of retail goods, he is not apt to compete very strongly with the paving contractors, automobile companies, and clothing manufacturers for the limited number of men who really want a job.

"As long as men are drawn from the farms by the high wages and short hours of city occupations, we cannot expect an increase in the production of farm products. As long as the production of manufactured goods per worker continues to diminish, due to the short hours and inefficiency, we cannot expect the cost of living to decrease.

"The remedy for the high cost of living is not on the farm but in the cities. When the city workers lengthen their working day to approximately the average length of the farmer's working day, speed up production as the farmers have done, and curtail their consumption of non-essentials, we can expect a reduction in the cost of necessities."

WAGES AND THE FARMER.

The National City Bank of New York keeps in very close touch with the business enterprises of the nation and evidently gives more than passing attention to the effect which the farmer has upon the prosperity of the nation and ihe wages factory men receive. If labor leaders in our cities would give the same intelligent study to our national problems, they would not be looking for shorter hours, higher wages, and cheaper food.

In a monthly report, the National City Bank of New York made the following comprehensive statement regarding the effect of the price of farm products upon the prosperity and the welfare of all other industries:

"The grievance of the farmers is that the prices of what they have to buy do not go down with the prices of what they have to sell, and this complaint is commended to the attention of all who think that the prices of manufactured goods can be maintained after the prices of farm products have generally declined. The purchasing power of the farming population is in the prices of farm products, and as they decline they will pull down the whole wage scale and price level.

,'Labor leaders may say that present wages will never be reduced, popular opinion may theoretically approve and employers may assent, but if the purchasing power of the great interior districts of this country decline, those districts will buy fewer goods unless hose goods ocme down correspondingly. The prosperity of the farming districts has been a very large factor in the demand for labor in the manufacturing cities. So long as employers are able to add wage increase to the price of their products they will grant the latter, but employment and wages depend at last on the purchasing power of the consuming public. The entire price and wage situation mlght change rapidly."

THE COST OF A SCRUB BULL.

It is estimated that in herds in which a scrub or grade bull is used each cow produces at least 50 lbs. less butterfat per year than if the herds were headed by a pure-bred bull. Fifty pounds of butterfat may be easily estimated to be worth $25.00 net to the farmer, over and above what it would cost to keep a pure-bred bull and the extra care in feeding the cows better.

A survey of Sheboygan County, Wisconsin, shows that it contains about 40,000 cows and that 37% of the herds are headed by pure-bred bulls. This leaves 63% of the total number of herds headed by grades and scubs or, in other words, about 25,200 cows in that country are sired by and bred to scrubs and grades. This number of cows, allowing 50 lbs. fat for the value of a pure-bred bull, would produce 1,260,000 lbs. less butterfat than if they had been sired or brad to pure-bred bulls. Calculating butterfat at 50c a pound, the loss amounts to the munificent sum of $630,000 annually. This is a large expense, if it may be expressed in this way, for the privilege of keeping grade and scrub bulls.

We appreciate that men who have reached the stage of keeping pure-bred bulls are better educated dairymen, but the stubborn fact remains, nevertheless, that those dairymen keeping scrub and grade bulls to head their herds are losing large sums of money. It shows that they need a better dairy education so they may be able to handle better dairy blood.—Hoard's Dairyman.

* * *

The better the farmer, the less sure is he that he has heard the last word on efficient farm management. There is no business in which more time and thought are being expended for finding better ways than in agriculture.

* * *

Let the young man about town out of a job try a year on the farm. Plowing will give them a new constitution, take the kinks out of his head, the fog out of his threat, the gas off his stomach, the weariness out of his legs, the corns off is toes, and give him a good appetite, and an honoset livlng.

HORTICULTURE.

WEEDS WE SHOULD KNOW.

Weeds are among the most commonplace of all plants. This fact everyone knows who has ever tried to grow a crop of any kind. We see very little use for this group of plants, and everyone knows that they mean work if a piece of land is to be cropped successfully. To learn something about the habits of our common weeds is the first requirement to possess in order to combat them successfully, and if all who are engaged in growing crops either in the field or in the garden would carry on a warfare against weeds, the time would come when these ugly pests would be on the decline. Talk against weeds ever becoming very serious has been laughed at by those who were farming newly broken land. This might be expected because weeds are rather scarce for a time at least under these conditions. The parents of many of you juniors know this to be a fact. But today much of the land which was at one time rather free from weeds is overrun by them, in fact some of it to such an extent that it has been abandoned. And all because we have been too careless in the matter of looking after them at the proper time.

Annuals, Biennials, and Perennials.

These are three big words with rather simple meanings. Any seed is an animal which lives by one season. Many of our most common field and garden weeds belong to this group. They start from a seed in the spring, grow up, blossom, and produce seeds and then die. This is all done in a single season and that is the erason they are spoken of as annuals. Perhaps you have noticed that no matter how clean you have kept your garden for a single season, not allowing a single weed to go to seed, there are always some weeds which come up again the next year. You have wondered at this, have you not? It is an easy thing to explain for one who knows the habits of some of these weeds. The soil contains so many seeds of various weeds that there is always the chance that some of them will live over in the soil for long periods of time. You ask, how can that be, since the seeds of our garden and field crops rot if left in the soil for any length of time. It is like this. Nature has provided many of the weed seeds with hard coats which enable them to resist decay for long periods. They may have become buried so deep that they could not germinate on account of not getting a sufficient amount of oxygen, but when the plow brings them near to the surface of the soil they are ready to grow. This explains why there are always some weeds to be found in the garden no matter how clean it is kept the preceding season.

Since annual weeds spread largely by their seeds, it is a comparatively easy matter to keep them in check by preventing them from going to seed. Any method which will stop them from forming seeds is good. In the garden where the numbers are usually limited, cutting them off or pulilng is the safest method. This should be done before they have formed any of their seeds, because when they are in the seed developing stage, there is sufficient nourishment in the leaves and stems to continue the seed formation, and the result will be that in many cases the seeds will be formed completely enough to germinate. Furthermore, when a weed is cut or pulled, care should be taken to see that it is entirely removed. To be sure of this they should be cut beneath the surface of the soil. If any of the lower branches are left, they will form seeds and the trouble will repeat itself next year. Cutting is usually done with a sharp hoe or with a spade, the latter being a good instrument to use when the weeds are large and scattered.

In the case of field crops ilke corn, cultivation is the one big way to keep the weesd down. This must be done at the right time, and done thoroughly, if the work is to be effective. Many corn fields in the fall do not look as though they had ever been cultivated. This is because the owner did not cultivate at the right time, or because he did not do the job effectively.

Rotation of crops also helps in keeping down annual weeds. When a piece of land is seeded down to clover and timothy, and a good stand has been secured, the weeds are crowded to such an extent, that this, together with the fact that the cuting of the hay crops retards their growth, tends to destroy them. If for no other reason than this, it pays to pactice a well worked out rotation system. Annual weeds may be destroyed in large numbers by using such implements as the drag and the weeder in corn and potato fields while the plants are still small or just coming up. If the work is odne on a bright day, the first crop of weeds in such fields can be eradicated very easily.

Annual weeds as troublesome as they are, are not half as bad as those which are classed as biennials and perennials. A biennial weed takes two years to mature seed. Like the annuals, it too starts from a seed, but instead of forming seed the first season, it just grows a big healthy plans, dies down in the fall, and starts again the following spring from the root. The burdock is a good example of such a weed. Usually biennials store up large quantities of food in a fleshy root the first season so that the next year the plant grows very early in the spring, using this food supply. Perhaps you have noticed the big root which the burdock has at the close of the figrst season's growth. Carrots and parsnips, although not weeds, are good examples of this. In order to get rid of biennials, we use the same methods already mentioned for combating the annual kinds, since like the annuals they usually spread from seeds. They do little damage the first season, beyond that of taking moisture and food that the other crops should have.

Undoubtedly the worst weeds which we have to contend with are to be found among the group known as perennials. A perennial weed lives on far an indefinite period of time and may produce seeds very year. Many of the worst ones spread in other ways than from seeds, and this is why they are so difficult to get rid of. Many of these are called noxious weeds because they are so difficult to eradicate. And the only way to get at them successfully is to first know their life habits. Two of the worst perennial weeds which every junior should learn to recognize at an early date are quack grass and the Canada thistle. These two have always been condemned by those who have had any experience in trying to rid the soil of them. They perhaps are the two worst ones in many sections of the northern part of the United States. Methods which are advocated for the eradication of annual and biennials are not at all effective in combating these two.

Quack Grass

Quack grass is among the very worst of all weedy grasses. It belongs to the same family of plants as all of the small grains, timothy and red top grass, but unlike them it is very undesirable. More than one acre of land is lying idle because this pest has taken complete possession of the soil. Usually all of this has been due to either carelessness or ignoraace.

This plant not only spreads itself by its seeds but also by a system of underground stems. In fact it is the latter which makes this grass noxious. These underground stems run along underneath the surface of the soil, usually at a depth of three or four inches. They look like roots and may easily be mistaken for them. They possess a great deal of vitality and hence they are not very easily killed. But you ask why they are so troublesome? The answer is this: At every joint or node a new plant starts to grow, and since each one has so many joints a single plant in time will produce a very large number of others, and in turn each of these is capable of doing the very same thing. Consequently it only takes but a short time before the soil is completely occupied with these underground stems, and a dense turf or sod is formed with which the other desirable plans cannot compete. If one plaws through a patch of this grass, some of these underground stems are bound to catch on to the plow and are then carried to other parts of the field where a new patch is soon started. This accounts for the rapid spread of this grass in many sections. It is quite evident then that to eradicate quack grass one must know at least this much about the plan.

Canada Thistle.

If the Englishman who brought the Canada thistle from England to Canada, thinking that it would make pretty good feed for mules, had to labor at eradicating this weed, the chances are that he would have thought twice before doing what he did. So persistent is this plant, that it, too, like quack grass, has taken possession of large areas of some of our best land. No one yet has ever found a place for the Canada thistle among forage crops.

Some people think that the Canada thistle does not produce seeds that will sprout. This idea is all wrong for the seeds of this plant will grow just like those of any other plant. Perhaps this idea was gained on account of the peculiar blossoming habit of the plant. Some plans produce stamens only and hence are not capable of forming any seeds. They blossom like any other plant, and because they do this but do not form seeds is a reason why this idea should have gained ground. It is only those plants which pjroduce thistles that form seeds.

But Canada thistles do not have to depend upon seeds in order to produce new plants. Any portion of a root is capable of doing this. In this respect they are like quack grass and for this reason Canada thistles are difficult to get rid of and are also considered noxious.

It is not difficult to learn to recognize this plant. It grows from 1 to 3 feet tall and has leaves of a bright green color which are smooth on the upper surface and rough underneath. The edges of tse leaves are wavy and are equipped with short stiff spines. The flowers are purple and are about an inch long. The seeds are smooth and brown in color, and are larger at one end than they are at the other. At the larger end there is a depression in which there is a projecting point.

Can These Weeds be Eradicated?

Any plant will die in time if it is not allowed to form leaves. This is because the leaves of a plant manufacture the food upon which the plant must live. So any method which will prevent them from forming any leaves will be effective if it is followed up. About the only way to get rid of either of these weeds is to destroy the roots and underground stems. To be sure it is a difficult task, because these parts of the plants are so persistent. Therefore we must be just as persistent in following up the method we adopt.

For large areas, about the only effective method to use is the fallow method. This consists of keeping the soil plowed or harrowed os that the plans cannot form any leaves. If this is followed up consistently during the fall and spring months and then a crop like corn is planted which can be thoroughly cultivated during the remainder of the season, the weeds will be so weakened that many of them will disappear the first year. But this will not probably be enough and unless followed up during the next few years, they will come back as strong as ever.

For small patches of either of these weeds one may resort to what is called the smother method. By covering the patch with thick tar or building paper, the plants will be smothered. Care should be taken to weight the edges of the paper down with stones or soil so that the wind will not blow it off. This method is very effective; the patch will die out in a single season. For Canada thistles one may resort to salting them. This is done by cutting off the plant close to the ground when it is in bloom and throwing a handful of salt on the top of the root. One application is usually sufficient. Of course this method can only be used when the thistles are confined to small patches. A good stand of alfalfa on a field infested with Canada thistles is another way of getting rid of them. The alfalfa crop grows so rapidly and the crop is cut so frequently that the thistles are weakened and finally die. Many alfalfa growers report that they have had good success with this method. When the field is again broken up it can be planted into corn. The cultivations which follow will entirely eradicate the thistles.

Do You Know These Weeds?

Here is a list of weeds which we lieve every junior who lives on a farm or who works in a garden should know. It will be interesting for you to check off from this list all of those which you already have learned, and then make it your business this summer to become acquainted with the others:

Canada thistle, burdock, oxeke daisy, snapdragon, cocklebur, sow-thistle, yellow dock, wild mustard, wild parsnip, Russian thistle, wild barley, morning glory, wild onion, quack grass, pig weed, lambs quarters, purslane, common plantain, buckhorn, common milkweed, sheep sorrel, corn spury, bouncing bet, dandelion, wild lettuce, green foxtail, yellow foxtail, common wallow, Indian mallow, back bindweed, chess, dodder, catnip, chickweed, sticktight, chicory, common ragweed, mayweed, mullein, lady's thumb, king head, bull thistle, and roadside thistle.

Fruit Packages

We Manufacture Strawberry Boxes and Crates for same, 6 qt. Baskets, Apple Boxes, Box Shooks, Apple Graders, Wheelbarrows. Now is the time to lay in a supply of Fruit Packages for the coming season. We have a good stock on hand, order early and ensure prompt shipment. Price on application to

HANTSPORT, N. S.

LIVE STOCK.

STEER SELLS AT 75c. PER LB. ON HOOF.

The Toronto Fat Stock Show held its tenth annual exhibition at the Union Stock Yards on Thursday, Dec. 11. There were upwards of twice as many entries as were forward the year before, and the quality of the animals compared favorably with any previous year. It is apparent that a great deal of renewed interest is aroused in beef cattle areas, and that fewer scrub animals will be seen at stock yards in the future. The well filled classes of the desir able blocky type were a source of admiration to the thousands of stockmen that visited the exhibition. Hon. Manning Doherty, Minister of Agriculture, spent a few hours in the yards, apparently taking a keen interest in the competition. He complimented the stockmen and Fat Stock Fair management on the progress made during the past few years in the quality of exhibits .

As at Guelph Fair the Grand Champion animal was a grade steer, "Black Hector," owned by W. G. Whitelaw, Elora. He is an Aberdeen Angus cross, and is exceptionally well finished, and firm to the handling.

The winner in the pure bred classes was a white Shorthorn steer owner by John Barr, Blyth, gaining the Walker House Cup and the sweepstakes for the best pure bred steer.

The grand championship for the best three cattle was awarded to T. A. Russell, Downsview, with a red, a roan, and a white, that were a picture of admiration for the beef cattle stockmen. G. E. Rowntrdee, Woodbridge, won the grand champion for car lots.

Some of the finest sheep ever seen at Toronto were in the pens and competition was keen and close. Hogs were out in greater numbers than ever and the uality was up to the usual high standard.

More remarkable than the show was the sale that was held on Dec. 12, the day following the show, where amazing prices were paid for prize animals. For "Black Hector," the grand champion steer, the price of 75 cents per pound on the hoof was paid. He weighed 1,290 pounds, and thus realized $967.50, a splendid price for a yearling. He was bought by H. P. Kennedy, Toronto. Immediately after H. P. Kennedy had purchased the champion steer, he wired the Live Stock Commissioner at Ottawa and offered to send him overseas to show the Old World that Canadians know how to raise cattle. The Live Sctock Commissioner eagerly accepted the offer, and along with a number of other cattle that Mr. Kennedy is exporting, Black Hector will travel to Europe. He will be consigned to the Canadian High Commissioner, and when it is thought that he has done his duty in advertising Canada, Mr. Kennedy will present him to whoever the High Commissioner suggests.

Along with Black Hector, the champion carload of cattle will cross the seas. Mr. Kennedy purchased them from George E. Rowntree, the owner, for 21 cents a pound.

The steer owned by J. M. Gardhouse, "Roan Jasper,," weighing 1110 pounds, and sold for 40c per pound, thus realizing $444.00. "Snowball," owned by J. Barr, Blyth, weighed 1220 pounds, and sold for 31c. per pound, thus realizing $378.00.

While single animals, as a rule, went for more sensational prices than the groups, carload lots sold remarkably well. Two carloads from Sprucedale Farms, 30 animals in all, brought the sum of $9,113.50. For three heifers under one year Short Bros, of Elora, received $650.

Sheep and hogs were sold in separate rings. The record price for sheep was paid by the Swift Canadian Company. For a pen of ten lambs or ewes, under 100 pounds, Swift's paid the owner, C. E. Meggs, of Paris, 41 cents a pound, a total of $371.05.

Hogs sold all the way from 26 to 50 cents a pound. A litter of hogs owned by J. K. Featherstone, of Streetsville, winners of the United Farmers' Co-operative Company's special prize, brought the tremendous price of $815, purchased at 50 cents a pound by the Harris Abattoir Company.

All the animals were quickly picked up, and the demand far exceeded the supply. The sales ring was crowded. Buyers came from Buffalo, New York, Chicago and Montreal. Bidding was keen, and though prices

AMHERST SPECIALS

In Sporting Footwear

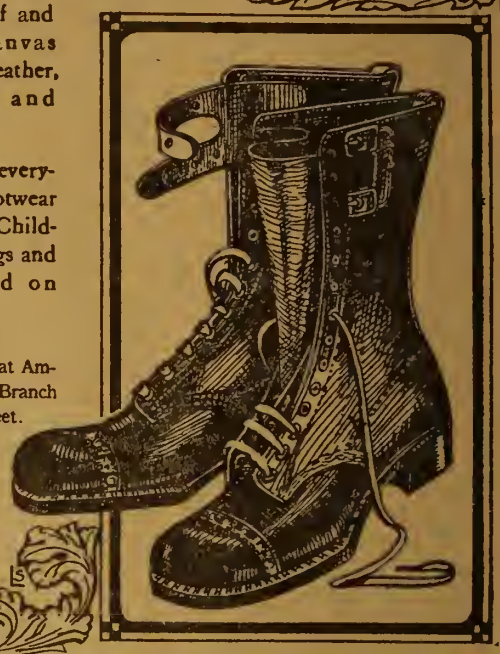
We manufacture a wide range, the Model featured in our illustration, with certain variations, covers a series of at least ten different leathers, colorings, etc., all strong, well made, serviceable and correct in line.

Our general range of Sports' Footwear includes Tennis, Yachting, Golf and other Specials in Canvas with Rubber or with Leather, also High Shooting and Fishing boots.

We have practically everything in Rubber Footwear for Men, Women and Children. Illustrated catalogs and price lists furnished on request.

Full and complete stocks at Amherst and at our Halifax Branch at 164-166 Granville Street.

AMHERST BOOT & SHOE COMPANY, LIMITED.



The Name behind Champion

Dependable Spark Plugs

For years we have been building a reputation for the dependability of Champion Spark Plugs. To-day "Champion" on the insulator of a spark plug is the world's synonym for dependability.

Champion dependability is based on thousands of experiments and tests, resulting in our famous "3450" insulator, which, because of its indestructible quality, gives exceptionally efficient service in all types of gasoline motors and engines.

No matter what makes of motor you own, there is a "Champion" that will give efficient service under any condition the motor itself will stand.

Look for "Champion" on the insulator as well as on the box.

were three times as high as on the ordinary market, the quality of the animals offered showed an equal difference.

SCOURS AND BLOATING IN SHEEP —SUDDEN CHANGES IN FEED THE CAUSE.

The season has come again when it will require some extra care in looking after the health of the average flock of sheep. It is often a question with the careful farmer how to handle sheep that have been fed on dry winter feed, in order to get them accustomed to grass. Sheep are very liable to bloating and scours, and when once an animal has had an attack of any one of these troubles it is apt to come back again on the least provocation when a sudden change of feed or pasture is given. There is never any trouble with sheep that are in climates that allow them some green herbitage or grass during winter, except the scours that come from sheep worms that are generated on sheep foul pastures but serious inroads to sheep health very often arise from bloating and scours that are the result of faulty management where dry winter feeding is suddenly exchanged for grass feeding.

The Danger of a Sudden Change of Feed.

The spring activities of the farm field are likely to divert attention from the sheep flock. The grass shows signs of coming along speedily and the sheep man is glad to be relieved of the sheep feeding chore. Lambs are well a-foot and able to look after themselves, but summer weather experience has not yet been their lot. In view of this fact it is convenient to take some thought in regard to training them for the new experience and grass feed.

There is a great diversity of opinion and accordingly diversity of methods adopted in turning a flock of ewes and their lambs on to pasture. There is very little written on the subject as to guidance in the matter. This may be owing to the fact that a hard and fast rule can hardly be laid down, seeing that spring seasons start away with a very slow growth of grass in which the digestive organs of the sheep naturally adapt themselves to the change at other seasons the growth is rapid and if the animals are not trained by some medium of gradual change, many deaths will occur.

It is necessary for every owner of a sheep flock to make some provision by artificial arrangement at the barn and in the field, so that little trouble will be found in giving the sheep a chance to become accustomed to grass feeding. Of course a whole lot of the success of the change depends upon the healthy state of the sheep before going on the grass. This is imperative in any case. Sheep that are inclined to be constipated will readily scour when turned out even only a short time to newly grown grass. The bowels of the sheep, previous to their being sent to grass hould be in a laxative state, and this can be done by allowing them free use of plenty of salt, clean pure water, and green clover hay and roots, and if grain feeding is done the addition of bran will improve it.

How Scours Can Be Avoided.

The writer's method is to arrange a barn or shelter shed that has access to a paddock or grass field by lane or pasasge way. When fed their usual winter feed in the barn or shelter they move lackwards and forwards between the grass field and the shelter as they wish. They thus get accustomed to grass, so that when the time comes that they can be out all night they are hardened to meet any cold night that may come around. and their digestive organs are gradually accustomed to summer grass. Without this arrangement the flock will cost a deal of bother at a very busy season. If kept in winter quarters till the grass is well grown there will be trouble if not closely watched when sent to pasture for the first week or so. A short time each day on rank pasture will have to be the order, and when taken home to the winter lot they will be restless. And restlessness acts on a mother ewe in the same way as it does on a dairy cow, and less milk will be forthcoming for the lambs.

Not only will a sudden feed of fresh-grown pastures cause scouring, but slight frosts that often occur in the spring mornings are fruitful of mischief among lambs. This will occur even after sheep have been accustomed to grass, and it is one incident in keeping sheep that is difficult to guard against its occurrence, chiefly because the frost generally comes on unawares and as late as the first weeks in June. When scours appear in a flock after eating frosted grass, it will be well to take the affected ones in hand and administer to them some remedy.

A similar condition will also arise with sheep that have had a long fast in a stockyard or on a railway journey. Here prevention is better than cure. Sheep or lambs shipped long distances should first be given dry feed and very cautiously turned upon rank pastures.

When frosted grass or overeating is the cause of scours, laudanum in tablespoonful doses for mature sheep, and less for lambs, is a standard remedy. It is best to give it in milk or water. If the appetite of the animal shows signs of being affected and it is dull and not inclined to eat, a teacupful of ginger in a cup of warm water will be found beneficial. There is always the danger of a recurrence of scouring when once it starts, and the shepherd's best method is prevention, by planning ahead how he can best secure the gradual change from winter to summer conditions.

WHEY TO CALVES.

Whole milk gives such splendid results with calves that we consider it essential for the first week or ten days. After that time, skimmilk can be gradually substituted for it. These two feeds are so well suited to the needs of the young calf that we would not try to do without them. Especially when calves are to be put on whey, it is essential that they be given a very good start.

By the time calves are three or four weeks old, the skimmilk can be gradually substituted with whey. Only that whey which is sweet and undiluted and has been kept clean should ever be fed calves. To be successful it is necessary that special attention be given to regularity in time and quantity of the calf pails.

In feeding whey, a feed relatively high in its carbohydrate value is supplied, the very opposite of skimmilk, which is comparatively high in its protein. It is necessary, therefore, to combine with whey feeds which have considerable protein.

By the time calves are five to six weeks old, they may be receiving 10 to 25 lbs. whey daily. Alfalfa or mixed hay should be fed in as liberal amounts as the calves will consume. Such a mixture as 200 pounds of ground oats, 200 pounds of bran and 100 pounds of oil meal should be very satisfactory as a concentrate allowance. Calves should have as much of such a mixture as this as they will consume until they have gotten a very good start, when the concentrates may be cut down slightly.

It pays to give calves the very best possible attention to see that they make the best gains which can be secured. Success may be attained in feeding whey if every precaution concerning cleanliness and concerning a balance of neutrients is employed. It is more difficult to raise good calves with whey than with skimmilk.—Hoard's Dairyman.

The De Laval Milker

Used on Breidablik Farm, Wilmington, Delaware

The De Laval Milker is in constant use on Breidablik Farm, milking sixty high-grade Guernsey cows daily.

The Breidablik Farm manager reported recently:

"The De Laval Milker has proved very satisfactory. It saves from two to four men and about an hour and a half at every milking. It is very simple to operate and to keep clean. In fact, so much so that a green man can do the work as efficiently as an old hand. It pleases the cows, as can be seen by our high records. Ten of our cows average over 10,000 pounds of milk a year. We have never missed a milking since we have had the De Laval Milker."

The De Laval Milker is a distinctly different type of machine. The Master Control of pulsation speed insures that every cow in the barn is milked in just the same way every day.

World's Record Jersey Blood by Auction

Not of one cow, but of the three most remarkable cows the Jersey breed has yet produced.

Sophie 19th of Hood Farm—189748. World's Champion Long Distance Dairy Cow—all breeds. Eight years authenticated tests, 100,557 lbs. milk, 7,235.3 lbs. butter.

Plain Mary—268206—World's Champion Jersey Cow. 15,255 lbs. fat, 1300.9 lbs. of butter.

Successful Queen—278743—one of the most remarkable cows of all breeds. 4 years record 59,907 lbs. of milk, 3840.2 lbs. of butter. Three three-quarter sisters, one half-sister of Successful Queen and sons of these cows will be sold.

We purchased the herd of 40 head that produced Plain Mary, including two of her sons. Five sons of their sire from high-producing cows, heifers and cows bred by or to these bulls, son and daughter of Plain Mable, half-sister to Plain Mary and the privilege of retaining on the farm some ten cows at the purchaser's option to be bred make up the contribution of Plain Mary and this herd to the sale.

The world-renowned Sophie Tormentor stock of Hood Farm will be represented by a beautiful son of Sophie 19th's Tormentor, one double grandson and several grandsons of Pogis 99th of Hood Farm, son of the celebrated cow—Sophie 19th of Hood Farm. Other cows of this breeding, in all 24 cows and heifers in milk and a total of 58 head of Jerseys will be sold.

DAIRYING.

TO CONTROL RINGWORM TREAT WITH IDOINE.

"Ringworm, a disease of the skin of animals characterized by the appearance of sharply defined roundish areas, may be cured by application of idoine or salicylic acid and alcohol. These spots are usually covered with scabs and crusts and are free from hair or nearly so," says B. A. Beach of the department of veterinary science in the University of Wisconsin.

"Cattle are most susceptible to ring worm," declares Dr. Beach. "Animals kept in damp, close, filthy quarters are more apt to have the disease.

"Ringworm is caused by a fungus which grows in the outer layers of the skin. The spores are very resistant and will live a long time in infected quarters. They grow when conditions become favorable. The germs are spread from infected animals or quarters to healthy animals. Blankets, harness, curry combs, fence posts or other objects against which the animals rub spread the disease.

"The disease may appear on any part of the body," declares Dr. Beach, "though the favorite places are the head, neck, shoulders, and back. If untreated, ringworm will spread over a considerable part of the body. Itching always accompanies ringworm in cattle, although it varies in intensity in different animals. In horses the itching may be absent."

Dr. Beach suggests this treatment: "Care should be taken to prevent contact between animals or infected objects. Thoroughly cleanse and disinfect as far as is possible everything with which the diseased animals have come in contact. The treatment consists of clipping the hair when necessary. The crusts are softened with green soap or ordinary soap and soft water. The diseased parts should then be painted with tincture of iodine, or salicylic acid and alcohol, one part to ten."

EFFECT OF FEED ON DAIRY PRODUCTS.

Milk and butterfat are the marketable products from the dairy farm and it is important that no deleterious effects be produced on those materials by the feed given to the cows. Hence, the effect of the feeds on the flavor of milk and the consistency of butterfat are worthy of consideration.

It is now generally believed that good feeds have no influence on the flavor of milk, though it has often been said that silage imparts a disagreeable flavor to milk. If the feeding be done carelessly this is true but if the silos are shut off from the barn, the cows fed silage after milking and not before, and given only what they will clean up in a short time, the danger of having a silage odor or flavor in the milk is negligible. The same applies to rutabagas. If the silage or roots are fed just before milking, or unused feed is allowed to remain indefinitely in the mangers, the milk, if not removed from the barn immediately after drawing, will take on a disagreeable odor. The presence of a silage flavor or odor in milk is due to carelessness.

Garlic and other weeds will impart an unpleasant odor and flavor to milk when they are consumed by the cows. This is due to volatile substances present which are absorbed from the alimentary tract, carried to the udder, and eliminated in the milk. Such substances, being volatile, do not affect the flavor of the milk for any considerable time after they have been eaten.

Certain feeds influence to a limited extent the chemical and physical characteristics and, consequently, the consistency of butter. Linseed oil meal, peanut meal, and gluten products have a tendency to produce a soft, salvy butter with inferior flavor, while cottonseed tends to produce a hard, tallowy butter. These feeds do not produce marked effects unless fed in too large quantities, and by properly balancing the constituents of the ration these influences can be minimized. The feeding of cottonseed meal in the summer time is often advisable as the butter produced at this season is generally soft and cottonseed tends to make it more firm.

Milk is remarkably constant in composition and general character and can be affected but little by feeding. Its flavor is not affected by feeds when the feeds are carefully handled. The nature of the butterfat can be altered somewhat; however, by the feeds given.

SALT FOR COWS.

All animals that consume large quantities of vegetable food require salt in addition to their regular feed. Old settlers of the middle west can still show you where the buffalo scooped large pockets in the ground by licking, in order to get at the salt in the soil. When cattle are confined for any length of time without being fed salt, they will make similar licks in the ground for the reason that there is always some salt in all soils.

When properly fed, salt has a beneficial physiological effect on the body, and serves somewhat as a spice to stimulate and increase the palatability of many foods. It also stimulates the secretion of digestive fluids, assists in the circulation of the fluids of the body, and prevents digestive disturbances. Formerly it was thought that salt increased the digestibility of a ration, but experiments have proven that digestibility is neither increased nor diminished by the use of salt.

54A

The dairy cow consumes a large amount of roughnes and requires salt continually, in order to thrive well and keep the milk bucket well filled. It has been shown, by evperiments, that for ordinary live stock three-fourths ounce a day for one thousand pounds of live weight is about the amount of salt required.

With the dairy cow it is a different proposition. Experiments in which producing cows were allowed to consume salt at will show that they require considerable more salt, in many cases several times as much, as do dry animals. The amount of salt consumed varies greatly with individual cows, and the only system of giving salt that allows for this is where the cows are allowed free access to it daily, or have a supply in the manger continually before them.

Another important factor to be taken into consideration is that salt requirements will vary greatly with feed from different localities. Soils which contain large amounts of salt produce crops containing more salt than soils low in salt. The water of streams and wells also varies in salt content. The farmer who keeps saft before his cows at all times need not worry about whether his feedingstuff and water supply contains a high or low salt content.

Barrel salt or compressed dairy salt should be used for salting cows. Never use crystal rock salt. Because of its extreme hardness, it requires too much licking to get enough of the crystal rock salt, and the sharp edges produced in the rock by licking frequently cut the tongue severely and cause eating to become a painful process. There is no donger of the animals consuming more salt than is good for them if loose barrel salt is kept before them continually, and they know how much salt they need must better than does the feeder. On the other hand, when supplied in large amounts, at intervals of one or two weeks, as is the practice with many farmers, there is danger of the animal eating an excessive amount of salt. This excessive amount of salt consumed after being kept from it for some time greatly increases the amount of water secreted in the urine. This causes an abnormal thirst and the animals will then drink large quantities of water which is apt to injure the digestion and lead to other disturbances in the system. Also, when an abnormal thirst for water has been created, and sufficient water is not supplied, the water content of the body will be lessened due to the increased loss through the kidneys. This causes an increased breaking down of protein and results in a loss of strength and vitality.

In experiment on a number of cows at the Wisconsin Station, it was found that cows would exhibit an abnormal thirst for salt when kept from it for two or three weeks, but the diminishing effect on the milk yield, or detrimental effect on the health of the animals, was not apaprent for a much olnger time. This period varied with different cows from one month to one year. The breaking down in health was always sudden and very extreme. The condition was indicated by a marked loss of appetite, hagagrd appearance, lusterless eyes, rough coat, and rapid delcine in weight and in yield of milk. When the salt was again supplied, they would quickly recover their normal condition. In one case, potassium cloride was given instead of common salt, which is solium chloride. The cows consumed considerable of the potassium salt, although normally, when getting sufficient common salt, they refuse to touch the other, and recovery followed as quickly as when common salt was given. This indicates that it is the solium and not the chlorine which is so necessary for the body to properly perform its functions.—C. O. Levine, in Hoard's.

ROPY MILK.

I have a cow 5 years old that has been fresh about 4 months. She has been giving just as good milk as any till 3 days ago. Now the cream is tough and stringy, acts like paste, and will stretch three inches from spoon and acts like it had rubber in.—H.E.C.

The ropy condition of milk is caused by bacteria which usually get into the utensils from the udder of the cow, the wash water, the dust of stables, or rfom the cooling tank. Sterilize all milk utensils by boiling after cleansing with hypochlorite of soda solution. If the cow in question has been giving milk for 10 months or more and is nearing calving, "dry her off." Eliminate sources of contamination of milk so far as found present.

FOULS.

I have some cows that are sore between the claws, some on the front feet and some on their hind feet. It looks just like thrush on horses and it smells just like thrust does on horses. Some have it on their heels and some in front, right between the claws.—H. F. K.

Manure, straw, or other irritants lodged between the toes start the trouble and then the excoriated skin becomes infected by pus germs or in the worst cases by the filth germ bacillus necrophorus. Perfectly cleanse the foot and then immerse it for two or three minutes in hot water containing 2 ounces of sulphate of copper (blue-stone) to the pint. Afterward cover the affected parts with oakum or cotton saturated with a 5 per cent. solution of coal tar, dip to be help in place by means of a narrow bandage criss-crossed between the toes and tied around the pastern. Renew the drssing daily until grat improvement results. Then apply pine tar twice a week.

HOT WEATHER

the season when a DE LAVAL SEPARATOR saves most over any other separator or skimmiug system

IT'S A GREAT MISTAKE for any dairy farmer without a separator or using an inferior machine to put off the purchase of a New De Laval Cream Separator in the summer months especially with butter-fat at the present unusually high price.

Great as are the advantages of the New De Laval over all other separators, as well as over any gravity setting system, at every season of the year, they are even greater during the mid-summer season than at any other time.

This is because hot weather conditions occasion greatest butter-fat losses with gravity setting and render it most difficult to maintain quality of product wiih any gravity system or unsanitary separator, while, moreover, the quantity of milk is usually greatest, and any loss in either quantity or quality of product means more.

There is the great saving in time and labor wirh the simple, easy running, easily cleaned, large capacity New De Laval machines over all other methods or separators, which naturally counts for more at this time of the year.

Hence the great mistake of putting off the purchase of a New De Laval Cream Separator in summer, whether you already have a poor machtne or none at all, and every dairy farmer should keep in mind not only that a De Laval will pay for itseff in a few months but may, if desired, be bought on such liberal terms as to actually save its own cost while being paid for.

Every claim thus made is subject to easy demonstration, and every De Laval local agent is glad of the opportunity to prove these claims to you in your own dairy, without cost or obligation on your part.

Why not see the nearest De Laval Agent at once ?
If you do not know him, write to the nearest office for catlaogue or any desired information

EGG LAYING CONTESTS

(Record of Performance AA)

Dominion Experimental Farms.

Announcement.

The Dominion Experimental Farm will conduct a second series of Egg Laying Contests beginning November 1, 1920, to continue for 52 consecutive weeks. The names and locations of the Contests will be as follows:

Canadian Contest.

Canadian Egg Laying Contest, Experimental Farm, Ottawa, Ont.

Provincial Contests

Prince Edward Island Egg Laying Contest, Experimental Station, Charlottetown, P. E. I.

Nova Scotia Federal Egg Laying Contest, Experimental Farm, Nappan, N. S.

New Brunswick Egg Laying Contest, Experimental Station, Fredericton, N. B.

Quebec Egg Laying Contest, Experimental Station, Cap Rouge, Que.

Ontario Egg Laying Contest, Experimental Farm, Ottawa, Ont.

Manitoba Egg Laying Contest, Experimental Farm, Brandon, Man.

Saskatchewan Egg Laying Contest, Experimental Farm, Indian Head, Sask.

Alberta Egg Laying Contest, Experimental Station, Lethbridge, Alta.

British Columbia Egg Laying Content, Experimental Farm, Agassiz, B. C.

NOTE:—The "Canadian" is open to entries from anywhere, the "Provincial" is confined to entries within the Province in which it is situated.

FEES.—The entry fee for the Canadian Egg Laying Contest at Ottawa is $15.00. The entry fee for all Provincial Contests is $5.00. One-fifth of the entry fee must accompany the application which must be received before August 15th. The balance must be paid upon notification of acceptance of the entry, which will be by September 30th. Should the entry not be accepted, the first payment will be refunded, but should the balance of the entry fee not be received by October 10th, the application will be cancelled and the first payment forfeited. Failure to forward the pen when instructed automatically forfeits the fee and the application is cancelled. All cheques or Money Orders must be made payable at par in Ottawa and made out to the "Accountant for Egg Laying Contest".

ENTRIES.—Entry forms and Rules and Regulations will be supplied upon application to the Dominion Poultry Husbandman, Central Experimental Farm, Ottawa, or the Superintenlent of the Experimental Farm upon which the Contest you wish to enter is conducted. (See names of Contests above.) Entries must be made direct to the Contest you wish to enter along with the first payment before August 15, 1920.

Rules and Regulations

1. **Number.** Each entry or pen shall consist of ten birds of a standard variety and each bird must be typical of the breed and free from standard disqualifications.

2. **Substitution.** Each contestant will be allowed to keep his pen of 10 birds up to strength throughout the contest. In the Canadian Contest two reserves intended as substitutes must accompany the original birds and will be housed with them in the pen. The 10 birds for the original pen must be specified before the contest begins. Further substitution will be allowed as deaths occur. In the Provincial Contests substitutes will be accepted when deaths occur.

3. **Acceptance of Entries.** As the accommodation at each contest is limited the acceptance of the pens will be influenced by:

1—Whether the entrant breeds the pen entered or not.
2—The number of birds of the same strain kept by the owner.
3—The Inspector's report of the flock.
4—The time of application.

4. **Inspection** Pens for which application have been received will be inspected between August 15th and September 30th, and those that may be among diseased flocks or in unsanitary conditions will be rejected, and those that do not promise to be mature or those that may mature too early may be rejected.

5. **Declaration of Health**—Each entry of a pen, and each additional entry of a male or female, must be accompanied by a declaration stating that the birds or bird come from a flock that has not been affected with chicken-pox or tuberculosis for at least three months previous.

6. **Banding.**—The birds may be banded by the owner with his own bands before shipment, but will be rebanded with sealed contest bands upon arrivel at the contest and the contest and the original bands removed. The contest numbers corresponding to owners numbers will be supplied him.

7. **Delivery.**—The birds must be delivered at the contest when notified by the management, express prepaid. This will be from the 15th to the end of October. Address the shipping crate plainly with the address of the contest as given in the announcement, and on each crate put your own ad-

You've Got to be Warm to be Happy

A COLD HOUSE is more than disagreeable. It is miserable. There is no relief. Warm Air—the simplest and least costly of all heating systems, is the best for cleanliness, health and comfort. Stoves and base-burners throw their dust all over the house and only heat parts of it. They heat the same air over and over again. The Enterprise Blazer combines heating and ventilation and it furnishes the moisture your lungs must have. The

ENTERPRISE BLAZER WARM AIR FURNACE

is a comfort that you owe to yourself and your family—to your pocket-book, too—for it is a money-saver on the coal. After thirty-five years of furnace building, it is the most economical furnace we know how to make.

Health and Comfort

Furnaces look alike—but they differ. Talk the matter over with your dealer and write us for our free booklet on the subject—"Warmth and Comfort". It will give you a lot of useful information.

The Enterprise Foundry Co.
Limited
SACKVILLE, N. B. 23

Makers of the well-known lines of Enterprise Stoves, Ranges and Furnaces

dress which must be the same as the address under which the application was made.

8. **Rejection.**—The management reserves the right to refuse any entries, to reject or return to the owner, or destroy birds suffering from contagious or infectious disease, or are in any way unsuitable for the contest, to clip the wings of any bird that may be troublesome, to reject all birds that show impurity of breeding or standard disqualifications, and to return to the owner pens from which eggs have not been received by December 15th.

9. **Breeding.**—The owner will be allowed to send after February 15th, a suitable male to mate with his pen, and all eggs from a mated pen from March 1st to May 1st will be shipped to the owner or to any other single address which the owner may designate. The eggs will be shipped once a week in bulk and only to the one address throughout the two months. All eggs collected that are not cracked or broken will be included in these shipments. As the mating of the pens is optional, it will be noted that in cost of production awards, a proportionate reduction of feed will be made in the pens having a male bird.

10. **Price.**—Eggs so shipped will be charged for at ten cents an egg and will be shipped, express collect. A bill will accompany each shipment which must be paid and the empty package returned before the next shipment will be forwarded.

11. **Feeding and Housing.**—The birds while in the contest will receive the best of feed and care, and the system of feeding will be mixed grain in litter morning and evening, and dry mash in a hopper before them all the time. Green feed, grit, shell and beef scrap or green bone will also be supplied. They will be kept in houses having glass and cotton fronts.

12. **Eggs Counted.**—The contest shall be decided by the total number of marketable eggs laid by each pen. Exceedingly bad shaped eggs, soft shelled eggs or eggs weighing less than 20 ounces to the dozen will not be given official credit.

13. **Disposal of Eggs.**—All eggs laid during the contest become the property of the Department of Agriculture, and those not shipped as breeding eggs will be sold at market prices.

14. **Reports.**—A report of the trap-nest weekly record of each bird and weekly and total record of each pen will be issued at the close of each week. Copies of this report along with a monthly summary will be sent to each Contestant and to all papers that will publish them.

15. **The Return of the Birds.**—If no notification as to the return of the birds has been received by October 1, 1921, the birds on the completion of the contest will be sent by express collect, to the owner's address from which the shipment was made. Should any of the pens not be laying towards the close of the contest, and not likely to lay before the end, they will be returned earlier so as to make room for birds entering for the next contest.

16. **Sale or Transfer.**—No recognition of sale or transfer of birds during the Contest will be made, nor shall any entry be withdrawn during the contest, except for reasons stated above.

17. **Record of Performance.**—All birds in the contests not otherwise disqualified and whose eggs average 24 ounces to the dozen, that in 52 consecutive weeks lay 150 eggs, will receive certificate of Record of Performance AA, and those that lay 225 eggs will receive certificates of Advanced Record of Performance AA.

18. **Responsibility.**—While every precaution will be taken, neither the management nor any official of the contest will be held responsible should loss occur.

19. **Final Decision.**—In all cases, the decision of the management shall be final.

Get ready to save the Fruits

Outdoors the fruits are ripening today. The Strawberries are blushing in the meadow, and soon the Raspberries will appear, then the Cherries white and red, and after that the plumper fruits, Plums, Pears, Peaches.

But tomorrow the winter comes, and how your folks will miss the fresh fruits of summer's plenty. So decide NOW to make the most of the season's fruit crop. Think what a shelf full of luscious preserves, jams and jellies will mean when canned fruits and manufactured preserves become almost prohibitive.

Do your next winter's marketing now. Provide yourself in time with jars, rings, glasses, utensils. But, above all, do your preserving so that it *cannot spoil*. Cook all your fruit with LANTIC PURE CANE SUGAR, Nature's great heat and energy food. Have everything at hand as the various fruits ripen in your own garden or orchard, or when they are plentiful and cheapest in the market.

FREE—The Lantic Library, *the most complete collection of recipes for sweets ever published. A book on economical preserves, jams, jellies and marmalade. A book on cakes and candies. A book on desserts of all kinds. Sent FREE for a RED BALL Trade-mark cut from bag or top panel of carton.*

Lantic Sugar

2 and 5 lb. Cartons - 10, 20 and 100 lb. bags

LANTIC is not only the best sugar for preserving, but the most ECONOMICAL on account of its high sweetening power and "FINE" granulation, which dissolves at once in the hot syrup. Get LANTIC SUGAR in original packages in the size best suited to your needs.

KIND OF HAY HORSES REQUIRE—IT IS THEIR STAPLE FOOD.

Just in the same way that a poor quality of gasoline will reduce the efficiency of an engine, so does a poor quality of hay affect the well being of the horse and reduce his fitness for work. As hay is the staple food of the horse every farmer should make himself thoroughly acquainted at sight with the good and bad qualities of that article. It is imperative that he should make himself conversant with the various points upon which the quality and value of hay depends.

The word hay, when mentioned in the horses's ration, is often a wide term, and its general quality is as varied as the number of farms on which it is made. To get the most out of the horse and at the same time keep him in fit condition for endurance to come again when required, hay of the best quality must be provided. Haymaking is an art that directly affects the horse industry and therefore as such, greatly affects the condition of the horse even where the same care and management is exercisd with prvailing different qualities of hay.

Horses Fed to Meet the Strain.

It is nearing the season when the hay crop will command attention, and those who are careful of the health of their horses during the whole year should be prepared to save its feeding value by adopting proper methods in curing it. For the feeding of all live stock around the farm it is necesary to exercise economy in preserving the nutritive quality of grasses and clovers in hay, but for horses it is more necessary. Their digestive organs are not arranged to utilize a bulky ation of fibrous forage. It is freely stated by observant men that food, nevt to inheritance, is the most potent factor in the improvemen of the horse, but it is equally true that food and its use not infrequently overpower inheritance. The well bred animal cannot fulfill all that its inheritance fits it to accomplish unless it is so fed to meet the strain and exertion of its duties. Injudicious feeding or feeding with a poor quality of hay may prevent the animal from accomplishing its legitimate and desired end. Other things being equal, real efficiency is more likely to accompany superior and judicious nourishment rather than inferior nourishment. Food plays an important part, not only in growth and development, but in efficiency and amount of work done by the horse.

Hay That is Unfit for Horses to Eat.

There is so much difference in the quality and feeding value of hay that it becomes of first importance to the horse, for the farmer to exercise foresight and judgment in its making. As many as thirty different grasses may be found in hay and only a small number of them go to make good hay. Inferior hay may consist of inferior grasses or superior grasses badly cured.

The herbage that grows on poor soil is often luxuriantly tempting in bulk for the farme to include it in the hay crop in a short hay season. But coarse rank stuff that comes from poor soil maks hay of non-nutritious and of small feeding value. This variety of hay is entirely unsuitaole for horses. It is made up with a class of grasses that horses will not eat even in the growing stage, and if forced to eat them as hay they prove positively dangerous to their health. It is only sheer hunger and want that will make them eat hay made from the coarse grass of water meadows, or run-out weedy pastures.

Again, the value of hay is influenced by the time it is cut. This value also refers to the best class of grasses or clovers, for their nutritive value is rapidly lost when cutting is delayed. To be careful in the seeding in choosing the best varieties of clover and gras seeds is not all that is required to produce good hay feed for horses. In a year when the hay crop is a poor one, farmers are tempted to allow it to stand uncut long after it should have been in the mow, in the hope of getting greater bulk.

The greater part of the nourishment of all crops passes into the seeds and is exhausted in their production. The feeding value of straw is comparatively small because the greater part of the nutriment properties has passed into the grains of wheat, oats, or other varieties of grain allowed to ripen; the same principle applies to grass. If, therefore, grass is cut after the seeds are formed and have fallen out—as they immediately do when ripe—the most nutritious part of the crop is lost, and all that is left for the horse o eat is that potrion which has been robbed of its most valuable constituents.

Hay That is Positively Dangerous to Horses.

A source of considerable evil to horses is mouldy and dusty hay. This condition often arises from the manner in which hay is cured after being cut. The so-called dust is in reality the outer layers, or coats, of the stems that have all gone to small pieces because of over drying in the field. In any case dust in hay is an indication that the hay is not in the finest condition. Dusty hay is unfit to use as food for horses, as it tends to indigestion and broken wind. Mouldy hay is caused by the hay heating in the mow throguh the crop being harvested in too green or too damp a state. This quality of hay is apt to act deleteriously on the kidneys of horses if given to them in any quantity.

The characteristics of the best hay are crispness and green color with the great proportion of the grasses in flower and the other just coming to the floweing stage. New

hay should be fed very sparingly to horses. With firms that use horses for hard work in cities, new hay of the season is never used before Christmas. It is apt to cause scouring, and for race horses, well saved hay is at its best when one or two years old. When older than this it loses much of its feeding qualities. Good clover hay is fattening, and in every way suitable for draft horses, but has not been found so well adapted for the fast race horse. Hay is worthless as a feed to any class of stock if not thoroughly cured, and to horses it is positively dangerous.—Otaawa Valley Journal.

IRREGULARITIES OF GAIT.

(By Dr. G. H. Conn, in Farmer's Advocate)

General Observations.—There can be no doubt in our mind since inspecting several thousand horses in the large markets of the U. S., but that irregularity in gait is more often overlooked than any other feature of our work horse. A small pecentage of draft horses have a very good gait, but there is a large percent. that is hardly passable. Too many people are content to overlook a poor gaited stallion or mare, if they happen to have a good body conformation.

Too much stress cannot be brought to bear upon the importance of breeding draft horses to insure a good open, active trotting gait. In buying horses for the British army, their officers paid particular attention to the gait of the horses that they bought, often over-looking other defects if the animal was well gaited. They are to be commended for this foresight, for the use of the large number of horses in our army during the last war has taught us lessons that should be profitable to our breeds, as it brought out the type of the utility draft horse. Army work is in itself much different from farm work, as it often makes necessary fast work and at times irregular feeding periods. At times extreme speed is required for some little time and this requires that the horse be very active and well gaited.

Causes of Falty Gait.—Irregular or faulty gait in the horse may be caused from faulty conformation of the feet and legs, or from bad shoeing. Many such cases are the result o lack of attention to the feet during the colt days. Not enough attention is paid to growing colts' feet. They should be kept well trimmed and level at all times. Most of the defects in gait that are due to the neglect of the feet during the colthood days, could and should be prevented.

Indications of Irregular Gait.—Many of the irregularities of the gait can be foretold from the conformation of the animals legs; thus a "base-narrow" or "rugger-heeled" horse will often interfere. A hose that is "based-wide" or "pigeon-toed" will usually paddle when he trots. The one that stands with the points of the backs very close together, will often forge when trotting.

Gaits of a Work Horse.—There are really but two gaits of the average work horse, and they ae the trot and the walk. Of course they are sometimes used at the gallop or at the running gait, but the trot and the walk is a slow four-beat and should be executed with snap and vigor and should by breeders be considered the most useful gait of the draft horse, for it is the only one at which he can be worked with the greatest degree of satisfaction. The trot is a more rapid two-beat gait in which the diagonal front and hind legs act together. It is possible by close attention to the conformation of the feet and legs of draft horses to breed animals with more style and speed at the walk, and with an asy open active trotting gait.

Interfering.—Is the singeing of the fetlock of the supporting leg with the foot of the striding leg, and occurs with about the same regularity in the front and hind legs.

Forging.—Is the striking of the bottom of the front foot or the shoe of the front foot wih the toe of the hind foot on the corresponding side. It occurs during trotting mainly.

Scalping.—Is the sinking of the hind foot at about the top of the hoof or at the junction of the skin with the hoof, on the ends of (or the heels) of the shoes of the corresponding front foot. This gait occurs only at the trot, and occurs just after the foot has left the ground. If it occurred later in the stride it would be "forging."

Over-Reaching.—Is a defect of the trotting gait in which the hind foot is brought forward before the front one has left the ground, and it strikes the front foot in the region of the heel, but may strike the leg anywhere from the heel to the knee in some animals, but the usual location is the heel. Not a common fault in drafters but sometimes seen.

Paddling.—Is an outward swinging of the leg in the direction of travel and occurs in "toe-narrow" or "pigeon-toed" horses. Very unsightly and common in heavy drafters .

Rolling.—Occurs in horses that are very wide between the front legs and consists in excessive side motion of the shoulders, and is more often noticed at the trot. Very unsightly and also quite common.

Pounding.—Is an irregularity of the trotting gait that is quite often seen in drafters; it consists of a very short, snappy step, with extreme flexion of the knees, and a bringing down of the feet with considerable force.

Winging.—Is very similar to "paddling" only more exaggerataed due to the fact that it is usually associated with considerable action or flexion of the knees.

Winding.—Is the placing of the striding leg around and in front of the supporting leg, much the same as rope walkers do when walking the rope. The tracks made by this gait are almost in a straight line.

Working the draft horse at a trot should de discouraged as much as possible, but there are some classes of horses that must be worked at a faster gait, and that is the reason that we feel that horses should be bred with the idea of improving both of the natural gaits, the walk and the thot. This can be accomplished by carefully selecting animals with the desirable conformation of feet and legs and then properly caring for the colts' feet during their growing period.

—Philip Brooks.

INHERITANCE OF PIGS.

Lucile kept under the shelter and as close to the buildings as she could to avoid the drizzle and puddles formed by dripping over and between awnings. Close to the wall were occasional dry spots.

But it was not to keep her shoes dry. They had been soaked in the morning and remained soaked all day. Now the bottoms seemed to be giving way and she feared more water might cause them to drop out entirely. The shoes had been purchased only two weeks before, very cheap, to be in harmony with the margin over the month's board, and the soles had proved to be paper instead of leather.

At the corner she sneezed, and within the next block she sneezed again, two or three times. She thought of the wet feet, of the 20 cents in her pocket. But she could not afford a cold. She went into a drug store and exchanged the 20 cents for a dozen five-grain aspirin tablets.

"Hello, Luce," called a girl at a side table. "Come on over and have some soda. Bob's setting 'em up."

"No, thank you. My feet are wet and I must hurry home to dry out."

"Aw, come on. What's wet feet when there's free soda?"

But Lucile hurried out. All were strangers to her except the speaker, who was a remnant girl at her own counter.

Passing through a bright glare in the next block, she recognized several of her shopmates just entering a cheap movie. They were accompanied by flashily dressed men and were talking loudly. One was a girl who worked at the next counter. Her feet had been wet all day and her clothes, too, for she had complained of being caught in a hard shower. Now she was going to a movie before making a change. Lucile could hear her cough punctuating the loud talk and laughter.

How cheap it all was and how pitiful! It was so different from what she had pictured the wonderful city. When an acquaintance had written she had felt the world opening at her feet. That was less than a year ago. The awakening had been rapid. And yet she never once thought of returning to the few rocky acres on the mountain side, where her father and mother had existed and finally died of work and lack of nourishment. Back there would mean greater hardships and slow starvation. As a girl she had gathered and sold wild things for a meagre education, and worked some for an uncle to get clothes money. The uncle owned a better farm—good enough indeed to afford a sort of living. Besides he had paid his taxes, while she could not get enough offered for the involved home place to pay her fare to the city. She had earned that by working for her uncle.

The first thing on reaching her room was to turn up the wick of a little oil stove and touch it with a lighted match. Then she turned the flame down to slower consumption of money-costing oil, fished from under the bed shoes that were beyond outside wear and exchanged them for her wet ones and placed a wire-legged pan of water-covered cereal on the stove as a promise for supper. Then happening to glance toward the door, she noticed two white squares that had been thrust under it.

The first letter brought a little flush to her face. In the city year she had been to three dances, the first as an awkward beginner, essaying a few steps with a messenger boy who had openly laughed at her. Albert Yost had introduced himself at the second and monopolized her company because no one else asked for it. Albert was a country boy, working in the basement shipping room of a crockery store, lonely and homesick and already loathing the unfriendly city. He told it so simply and with such droll pathos that Lucile's heart was warmed towards him. The third time he had called for her and again monopolized her company because he was the only one who wanted it.

The letter was from him and read:

"Dance at the Academy hall next Saturday. Will you go with me? Let me know. I'm dead tired of the cheap old city and you're the only thing in it that reminds me of country flowers and running brooks. Maybe it's because you like to talk about them. Please.

"ALBERT."

Lucile glanced at the bulging soles of the shoes she had placed on edge near the wire legged pan to dry out, and sighed. She had a conviction that the first shuffle would scatter the paper frouds over the dancing floor. If only it was a Saturday later her pay envelope would intervene, and she could buy a new pair. She must refuse, and couldn't explain the reason why.

The other letter opened her eyes wider and caused her to ignore the danger signal of the cereal, from which the water had evaporated. The letter was from a girl friend. It ran:

Hello, Lucille! I'm rsuhing this off to get the news to you before anybody else. My Uncle Ben's the lawyer here, you know, and I happened to be over there and heard him mention the will to Aunt Charity. Then I just flew. Uncle Ben is likely to write to you this evening or tomorrow, as he has charge.

"But there! I'm forgetting to tell what I'm telling. Your Uncle Caleb died, and ordered that noboby should come to his funeral. He hated folks, he said, and didn't want them looking at him. And, oh, Lucile, he left the farm and pigs to you. He told Uncle Ben that you were the only one of his kin who dared to look straight into his face and speak out, and he liked you for it. And pigs! You've no idea! You've no idea! They squeal from end to end of the farm, 40 or more big ones and over 200 little ones! Just think! Your uncle thought that Hoover in the paper is the greatest thing ever, and lived up to it. He scraped up what money he could, and sold horses and things, and bought pigs. He kept back $100 to help carry through feeding them, and had sheds and sheds of corn and small potatoes for what Uncle Ben calls stock feed. And the squealers are all yours, Lucile. Wouldn't I just like to see you with a drum major's baton marching ahead of them all.

"Of course you couldn't come back to this poky desolation to live, but of course you will come back to sell off the pigs. Just think! It will set you up so you can leave forever that awful store—at the Hoover conservation pig price, you know. And it will give me a chance to see you, and to talk with you about the enchanted city. Oh, that my people were so poor that they would let me go away to earn a living. Then I'd join you."

Lucile's dreams that night were a jumble of shoe soles and Alberts and pigs. They were fighting in trenches, with bursting shells keeping them in whirling leap frog motion. Once her eyes popped open and the bursting shells simplified to a violent sneezing. Half awake her hand groped out to a chair that held a glass of water and a pill box, and she swallowed two more tablets. But with the closing of her eyes the leap frog chorus went on.

In the morning she lingered half an hour about her breakfast until the first mail came, but it brought no confirmatory letter from the lawyer. At the store, however, she found a sharp reprimand, with an intimation that a repetition of such tardiness would lose her the job.

But when she came back to her room at night the letter was on the floor under the door. She snatched it up quickly. If her friend was right she would give up her job, go down and sell the pigs, and then—what? She had lost her illusions about the city, but could she live back there, even on her uncle's farm? It was six miles from her friend who wrote the letter, and half that from the nearest neighbor. Could she stand it? Could she—a girl—go there and make a living, even with pigs? Or, for that matter, wouldn't she need a lot of help to take care of the pigs, and where would the money come from to pay them? And then, there was Albert Yost.

Suddenly her face changed, for the last part of the first paragraph read: "Only on condition that the said Lucile Speers comes to the farm and takes care of the pigs herself, or overlook its being done. This for her own good, for she is by rights a country girl and not a city one. And the farm is not to be sold or rented."

As she read her mind settled things rapidly. Of course, she must accept the farm. There was no other way. But wtih the decision came a curious relief, and even exultation. No more drudgery. No more paper soles and aspirin. She would wear clodhoppers—anything—for back there they would not be critical like in the city. The department owed her a week's wages. She would draw that, deducting a pair of new shoes, strong ones. Her cheap watch would sell or pawn for two or three dollars and her oil stove for half price. Yes, she could go back. If—if—only——.

It was as though it were a question which he answered promptly. The rap was imperative and the response to her "Come in" impetus.

"I got your note, Lucile, and—— and it knolked me so I understand at once how it was with us—with me, I mean. Will you marry me right off? There's that little afrm you spoke of, swamped with taxes. I've got $80 saved up—not enough to buy everything, of course, but maybe we can fix up to hire till I can work the taxes clear. Will you, dear, right off?"

"Do you like pipgs?" she asked inconsequently.

"Yes—that is, I don't know from practice. I used to run a milk wagon for a dairy farm. But I like anything that's farm and country, pigs and all. We'll buy one, and——"

"Oh, I mean dozens, hundreds"—spreading out her arms—"but it's all right. Yes, I'll maryy you, right off, for we must start to the farm in the morning. Now you can walk with me to the department sore while I draw my wages and buy a pair of shoes."

ANNUAL CONVENTION OF THE WOMEN'S INSTITUTE OF N. S.

(Continued from page 743)

At the close of the afternoon session the delegates were invited to a garden party given by Dr. and Mrs. Cummings on the beautiful grounds surrounding their residence. A bountiful and delicious tea was served and a delightful social hour was enjoyed, which added greatly to the pleasure of the visitors.

Wednesday, 7.30 p. m.

The Wednesday evening session opened by community singing conducted by Mr. H. A. Wellard, A.R.C.M., in which all the delegataes joined most heartily. Mr. Wellard prefaced the demonstration with a few remarks on the benefits of music and the influence it asserts in our lives. "We cannot all sing like Caruso," said the speaker, "but singing is not for the few; we can all use the voice we have in the best way we know how." We should choose the best in music; we demand the best in other things, why not in music? He commented on the way the National Anthem is so often sung and said it should be sung as the National Anthem of a live nation, not as a funeral dirge.

Dr. Cumming, the chairman of the evening, then introduced Dr. B. Franklyn Royer, director of the Massachusetts-Halifax Health Commission. Dr. Cumming explained the aims of the commission ,telling of the wonderful assistance given by the State of Massachusetts to Halifax in her time of need. Of the large sums of money given about $70,000 had been left and it was the wise expenditure of this money of which Dr. Royer now had charge. This fund had shown in a tangible way the bond of international friendship which exists between the United States and Canada.

Dr. Royer then explained to the audience the work which is being carried on in Halifax. With the conclusion of the armistice and the end of Red Cross activities there was found much to be done in the salvaging of wasted lives. With the money now available by the surplus in their favor it was planned to start a campaign of preventative measures, by spending a great deal of time in seeking the cause of and constantly watching for symptoms of disease. Great strides have been made in Paris in this direction since the close of the war. Two health centres are planned, one to be located in Halifax and the other in Dartmouth. The campaign will be started with the exppectant mother soon after conception and close supervision will be given until birth and will continue until the child reaches school age. It is in this period that the development of the child should receive close attention. The nurses in these centres will discover the causes of any defects before the untrained mother can realize the trouble, and will know if this is the result of wrong diet or what ever the cause. In connection with such a health centre there will be a clinic which will largely be a campaign of education in the home. There are defects in regard to the lack of fresh air, bad diet and the faulty methods of living in general, which must be corrected. Tuberculosis, too, is a problem in the province and all should be taught the proper methods to resist this insidious germ.

In the city of Halifax a suitable building will be at hand where the Women's Institute and Local Council of Women will organize to teach classes of young married women how to cook: so many young girls are entering married life without this knowledge. On the grounds will be established a camp for children in which they may spend a day and get a good square meal. One centre will be near the Dalhousie University and will enable the medical students attending that institution to get the proper home touch in preventitive measures and the cause of disease under local conditions. Dr. Hattie, the very efficient health officer of the province, is to organize a health clinic in each county. The County Council will bear part of the expense and the Red Cross came to the rescue and offered to place one health nurse in every county.

Dr. Hattie is planning a pre-natal clinic in every county. Hants, Pictou and Yarmouth counties have already one of these clinics under way. Dr. Royer told of the wonderful travelling clinic being established throughout the province by the Red Cross. This clinic will consist of a travelling caravan equipped with all modern appiances for combating disease. Health talks, illustrated by moving pictures of wonderful educational value, will call attention to wrong methods of living. Each caravan will be out six weeks, and a public health nurse will be stationed in each centre.

After this interesting address, Miss Jean Creelman, of Truro, entertained the audience with a delightful reading, which was splendidly rendered and heartily encored.

No Baby No Nation.

Dr. Helen MacMurchy, Chief Child Welfare Department, Ottawa, was next intorduced by Prof. Cummings. Dr. MacMurchy is one of the foremost women of Canada, a real friend of the children and herself largely responsible for the fine system of health supervision and fedical inspection in Ontario. "No finer selection," said Prof. Cumming, "could have been made by Canada in placing her at the head of this new department."

Dr. MacMurchy said that there was no audience that she would rather come before than that of the Wowemn's Institutes, they are the salt of the earth. Their community work is almost unestimable in value. They know the needs of the community and are able to meet them. There is room in national service for all, with ample scope for everyone's work. Speaking of this new department in the government, Dr. MacMurchy said there had always been a board or department of health but this particular department had been asked for just immdiately after Confederation and they had gone on asking until at last in 1919 it had been given them.

For many years they had been working for this in England. Edward Chadwick, a wonderful man who had made vital statistics his life work there, said that we ought to get at the very cause of things.

At last in 1918 they had secured their department, for the establishment of which fourteen departments had to be displanted. England is the greatest nation in the wolrd, in sanitary science as well as in war.

In Canada only seven departments had to be displanted. Immigration, medical inspection of immigrants, opium and drugs, patent medicines, housing and other departments of government all had to be re-arrarnged and properly welded into one Child Welfare Department.

Canada does not know enough about her children; she knows not the number that she has, nor the number that die in infancy; she does not know if we need to worry over the the child labor question, but must find out.

It was at first thought that there were not many mentally defective children until that department was organized. England has her registration system—the United States, too, but not long enough to have counted her children.

What Canada knows of her children is not very satisfactory. Doctors count children by the one, two or three thousand born. During the year, in Canada, hardly a city saved more than 900, some cities lost two and one city five out of every one hundred born. These are poor records. In London, England, at the last record, all but 91 out of one thousand were saved. New York's record is almost as good. New Zealand has lowered her child mortality to 38 per thousand. How did they do it? By knowledge, hard work, and the Grace of God. Get it before yourself that this good record can be attained in Canada.

Dr. MacMurchy said one cause of the great infant mortality was the artificial feeding of children. The greatest insurance on a baby's life was the nursing of the baby by the mother. Nurse the baby within the first 24 hours. Do not wait too long, for the baby soon seems to lose the vitality with which it is born. In the four years and three months of the war, 60,000 men were lost from Canada. In the same period infant mortality under one year was 70,000.

These statistics helped largely in establishing the department of which she is chief. Although you may not have these figures at your finger ends, Sir Robert Borden and those at the head of affairs have and they know the need for a drastic move to better conditions. The birth rate in Canada is not satisfactory, except in wise, sagacious, Quebec. No baby, no nation.

Then, too many mothers are being lost in Canada, the Child Welfare Department and the Women's Department are par eminent. This department has been established to remind the nation of the supreme value of the child and she would, too, remind them of the supreme value of home life.

All present listened with rapt attention to Dr. MacMurchy, who so ably handled her subject.

Meeting adjourned with the singing of the National Anthem.

Thursday, 10 A. M.

The Thursday morning meeting opened with the supervisor in the chair. Miss McDougall briefly referred to Dr. MacMurphy's excellent address of the previous evening and the splendid tribute she had paid to the Women's Institutes.

The report of the nominating committee was given by Mrs. Hamilton. The following were recommended as convenors of standing committees to work with convenors of national executive:

Agriculture—Mrs. DeWolfe, Truro; Home Economic—Mrs. Collins, Port Williams; Education—Mrs. L. A. Moore, North Sydney; Health—Mrs. Lovitt, Bear River; Publishing—Mrs. Geo. A. MacIntosh, Oxford; Legislation—Mrs. Wallace, West Gore; Finance—Miss Annie Stuart, Grand Pre.

Miss Stuart explained the responsibility Nova Scotia will have to assume in regard to the financial committee of which she is now convenor. No organization can be managed without funds, and it will be incumbent on the members of the Women's Institute to help bear the expenses of the Federation. Miss Stuart thought that perhaps a set sum would be voted by each institute.

Miss McDougall here explained that the Federation is not financed by the governments although they had received some support from them. The initial entrance fee, $100, had been paid by the government of Nova Scotia, also the expenses of Miss Stuart and herself to the recent convention in Toronto. Some of the other provinces had refused to assist to this extent. The Dominion Minister of Agriculture was approached by a committee to ask for a Dominion grant, to be used as a reserve fund. The committee was received cordially and promised support in this measure.

The expenses connected with the work of the Federation are numerous. Expenses are incident to the work of the publishing committee, the paying of a stenographer for the president and the carrying on of the work plan throughout the provinces in the interest of the institutes along such lines as lectures and talks on Institute Technique.

Dr. Patterson has offered a splendid manuscript giving instructions and talks on Personal Hygiene and First Aid. This book is invaluable and the offer a generous one, but it will take money to publish this pamphlet, which will be another form of well merited expense.

Each province will be asked to raise a sum in accordance with the financial strength of the province. Each province has been allowed equal representation and therefore can not afford to refuse to bear a share of the expense.

Miss Stuart chose the following members to work with her on the financial committee and devise the best way of raising Nova Scotia's share of the funds: Mrs. Ogilvy, Glace Bay; Mrs. Balcom, Northtown; Mrs. Meisener, Brigdewater;; Miss McDonald, St. Andrews; Mrs. Salus, Port Maitland.

Miss Fraser suggested the institutes be taxed according to membership, which seemed the fairest way of assessment. Miss Stuart said she $300 would be a fair share for Nova Scotia.

Miss McDougall, speaking of the work of the publicity committee, urged the institutes to keep her supplied regularly with news to send out. An official organ of their own was at first talked of by the Federation, but at present the cost of operating it is considered to be prohibitive.

The Nova Scotia Institutes have never officially adopted an organ, although they had sent news items to several magazines. The Canadian Home Journal will at present print the news of the Federal Institutes.

Miss McDougall then read a mess-

MINARD'S LINIMENT

King of Pain

The old reliable remedy for Rheumatism and Neuralgia, Sore Throat, Sprains, Strains, Swelling of any sort and Bruises

RELIEVED THE PAIN

Miss Ruth Tarkington, 12 Trafalgar St., St Thomas, Ont. "My grandmother was subject to rheumatism and used to call me from my playmates to go to the druggists to get Minard's Liniment. I was often unwilling and declared I hated that old stuff, but I soon found out how good it was. I got neuralgia. Grandma came with the Liniment and applied it to my head and I was very much surprised to feel how quickly it relieved the pain."

Kidneys Were Bad After The "Flu"

Sat Up to Turn in Bed.

That awful epidemic, the Spanish influenza, that swept Canada from one end to the other a short time ago, left in its wake a great many bad after effects. In some cases it was a weakened heart, in others shattered nerves, but in a great many cases weak kidneys have been left as a legacy.

Where the kidneys have been left weak as an after effect of the "Flu," Doan's Kidney Pills will prove to be just the remedy you require to strengthen them.

Mrs. Harvey D. Wile, Lake Pleasant, N.S., writes:—"Last winter I was taken sick with the "Flu," and when I did get better I found that my kidneys were very bad, and at night I had to sit up to turn around in bed. I used Doan's Kidney Pills, and found that they did me a wonderful amount of good. I also recommend them to my husband, and he started in to use them. I will always recommend them to anyone who is bothered with kidney trouble, for they are wonders."

Doan's Kidney Pills are 50c. a box at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

See that our trade mark, a "Maple Leaf," appears on the box.

CANNING STRAWBERRIES AND CHERRIES.

Strawberries are such a delicate fruit that their successful preseva-tion always offers difficulties. They consist of more than ninety per cent. water; their covering is very thin and easily boken; from their position close to the ground they are literally covered with bacteria, which quickly enter any break in the skin and cause decay; and withal the flavor is so delicate and the fruit so tasteless and uninviting once the flavor is lost that the task of canning is never easy.

Nevertheless, careful selection and intelligent handling enable the house-wife to retain in the canned pro-duct the bright red color, the unusual shape, and the delicate flavor that make the fresh fruit so attractive. For canning purposes only straw-berries that are large, firm, and slight-ly underripe should be chosen. Then it is important that the fruit be handl-ed carefully so as not to break the skin. The berries should be washed by gently lifting them in and out of water. Finally, it is necessary that strawberries be canned very soon af-ter picking; the best results are se-cured only if the fruit is in the jars within two hours after leaving the vine.

The selection of large, firm berries slightly underripe is not so expensive as it at first seems. Of course the first cost is greater; but well-chosen berries can so much better that the final cost per jar is less than if cheap-er and pooer fruit is selected.

It need hadly be said that such a delicate fruit as the strawberry can-not retain its natural color, shape and flavor if boiled; but if great care is used, they may actually be preserved without the addition of any heat what-ever. Most housewives will find it easier and more satisfactory to use the syrup method. This method not only insures the preservation of the fuit in all its natural delicacy, but also makes the labor of canning much less than if the boiling method were used.

In spite of all care, it will always happen that there is more or less small and overripe fruit. Though this should never be canned, it need not be thrown away. It can be used very successfully for both jams and mar-malades. Often, too, it can be used in combination with other fruits with real economy. Rhubarb is usually much cheaper than strawberries; and as a small amount of strawberries flavors a large amount of rhubarb, the combination is often advant-ageous. Likewise even the best strawbrries can be combined econo-mically with higher priced pineapple; a very little pineapple juice gives a decided pineapple flavor to a con-siderable quantity of strawberries.

In many respects cherries are very different from strawberries. While strawberries are often allowed to be-comeoverripe, cherries are usually picked long too soon. At best they contain too much acid to have the best flavor; but if the fruit is allow-ed to remain on the trees two or three or even four weeks after it is originally picked, the amount of acid materially decreases. At the same time there is a great gain in sugar, and in addition the fruit becomes larger and juicier.

Cherries are also unlike strawber-ries in their qualities. Even if very ripe they remain in good condition fo twenty-four or thirty-six hours af-ter picking. This allows ample time to can them without undue haste.

Like strawberries, cherries should be heated as little as possible, in the process of preservation. However, the reason is different. Heating pro-duces in cherries a very strong and disagreeable flavor by bringing about chemical changes in thei composition.

The problem of pitting is trouble-some in preserving cherries. Some women solve it by leaving the stones in. This is an easy solution, but the pits cause trouble when the fruit is served. It must be said, however, that they give the fruit a peculiar spicy flavor that most people like very much. In no case should the cherries be seeded by hand; seeders are so cheap and so ffectiv in these days that no woman can afford to use the old hand method.

Following are exact directions for preserving strawberries and cherries in a vaiety of ways:

Canned Strawebrries (Syrup Meth-od)—Select firm slightly underripe berries; reject absolutely all overripe and soft fruit. Wash the berries by gently lifting them in and out of wa-ter. Do not allow them o stand in wa-ter even for a few minutes, as this quickly causes softening. Stem the berries and drop them at once into jars that have been sterilized by boil-ing for twenty minutes. FHl the jars as full as possible without crushing the fruit; gentle shaking causes suf-ficient settling. Put a new rubber on one jar, stand it in a clean plate to catch all overflow, fill the jar to over-flowing with a heavy boiling syrup made by boiling together for twenty minutes equal amounts of sugar and water, and seal the jar at once with-out first wiping off the overflow syrup. Proceed likewise with the oth-jars; when all are sealed they may be washed off with a moist cloth and wiped dry.

Preserved Strawberries — Prepare the berries as for canning. Place two quarts in a wide-bottomed preserving kettle and cover them with one and one-half quarts of sugar. Place the kettle over a slow fire. Do not stir the berries to prevent burning, but shake the kettle ferquently as if pop-ping corn. Gradually the sugar dis-solves and the liquid covers the fruit. As soon as this happens, increase the heat enough to produce boiling and continue the boiling slowly for fifteen minutes. Put a new rubber on a jar, stand it in a clean plate, fill it to overflowing with the boiling berries and syrup, and seal it at once. Pro-ceed likewise with the other jars. Strawberries heated thus, scorch very easily, so it is necessary to watch the

Clean to handle. Sold by all Drug-gists, Grocers and General Stores.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-haud.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest iu life, I want to pass ou to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write aud tell me how you feel and I will send you ten days' FREE trial of a home treatmeut to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight aud dragging down sensations, falling or displacement of internal organs, bladder irritation with fre-quent urination, obstinate constipation or piles, pain in the sides regularly or irregu-larly, bloating, dyspepsia, extreme nervous-ness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, pal-pitation, hot flashes, weariness, sallow com-plexion, with dark circles under the eyes, pain in the left breast or a general feeling that llfe is not worth living, I invite you to send to-day for my complete ten days' treat-ment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home. without the expense of hospital treatment, or the dangers of an operation. Women every-where are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been bene-fited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

MRS. M. SUMMERS, Box 309 Windsor, Ontario

Read My FREE Offer.

To Mothers of Daughters. I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis). irregularities, headaches and lassitude in young women, and restores them to plump-ness and health Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treat-ment a complete ten days trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not inter-fere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

The Tonic that Builds You Up

Don't think of OLIVEINE EMULSION solely as a medicine for Heavy Colds, and Deep-seated Coughs. It is more than this. It is the best tonic you can take to purify the blood, give you an appetite, improve the digestion, make flesh, and renew your vigor and vitality.

OLIVEINE EMULSION

The Great Health Restorer

is the ideal spring tonic for the whole family: for pale, thin children as well as for men and women who are tired, worn-out and all run-down.

Get a bottle of this splendid medicine and see how quickly you begin to pick up. Sold by Druggists and General Stores.

Prepared by
Frasier, Thornton & Co. Limited
Cookshire, Que.

9

fire carefully, a large-bottomed kettle to secure success, but the excellence of the preserves justifies the extra pains.

Preserved Strawberries — (Boiling Method)—Prepare the berries and a heavy syrup as for canning. While the syrup is boiling rapidly, drop in large, firm berries until the syrup is thick with them, but not crowded. Lower the heat somewhat and continue the boiling slowly for fifteen minutes, or until the berries are a rich red color and the syrup is thick. Put a new rubber on a jar, stand it on a plate, fill it to overflowing with berries and syrup, and seal it at once. Proceed likewise with the otber jars. This method cannot be used with a large amount of berries at one time; usually two quarts is the limit.

Sweet Pickled Strawberries—Prepare two quarts of berries as for canning. Add two cupfuls of sugar and slowiy heat the mixture to the boiling point. Add half a pint of vinegar and continue the boiling ten minutes. Then keep the berries over a slow fire, but below the boiling point, for an hour. Place the berries in jars and boil syrup until it thickens. Put new rubbers in place, fill the jars to overflowing with the boiling syrup, and seal them at once.

Strawberry Marmalade—Marmalade affords the best means of utilizing small and overripe strawberries that are free from decay. Wash the berries quickly, stem them, place them in a peserving kettle, crush them, and add three-fourths as much sugar as there is crushed fruit. Boil the mixture over a slow fire for twenty minutes, stirring it often enough to preventvent scorching. Seal the marmalade in jars.

Strawberry and Gooseberry Marmalade—Use any proportion of the two fruits. Crush the gooseberries, cook them until they are tender, and remove the skins by running the fruit through a fruit press. Measure the pulp and juice, add an equal amount of sugar, and bring the mixture to a boil. Crush the strawberries, add half as much sugar, and bring the mixture to a boil. Mix the gooseberries and strawberries, boil the combination slowly for twenty minutes, pour the marmalade into jelly glasses, and cover it with melted paraffin.

Canned Cherries—(Syrup Method)—This is the easiest and best method for canning cherries. Wash the fruit carefully, remove the seeds, and drop the fruit at once into jars that have been sterilized by boiling for twenty minutes. Pack the cherries into the jars closely. Put a new rubber on one jar, fill it to overflowing with a heavy boiling syrup, and seal it at once. Proceed in the same manner with the other jars.

Canned Cherries—(Steaming Method)—This method requires more time and labor than the syrup method, and the canned product is seldom as good; yet some women prefer it. Wash and seed the cherries, place them in jars, and shake them down carefully. Put the covers in place loosely without the rubbers, set the jars in a wash boiler on a false bottom of cloth or shingles, surround them with a few inches of warm water, put the cover in place, and boil the water until the cherries are heated through. Then remove a jar, put a new rubber in place, fill the jar to overflowing with a heavy boiling syrup, and seal it at once. Proceed in the same manner with the other jars.

Preserved Cherries With Currants—Mix together four quarts of seeded cheries, one quart of stemmed currents, and five quarts of sugar. When the sugar dissolves, cook the mixture slowly for half an hour. Pour the preserves into jelly glasses and cover them with melter paraffin.

Preserved Cherries—Put two quarts of seeded cherries into a wide-bottomed granite pan with three pints of sugar, and proceed as per directions for preserved strawberries. Howevee, let the mixtue simmer slowly for twenty minutes instead of fifteen. Cherries preserved thus have an attractive bright red color and a very mild flavor.

Sun-Peserved Cherries—Place the washed and seeded cherries in the preserving kettle with an equal amount of granulated sugar and proceed as per directions for sun preserved strawberries.

Pickled Cherries — Select cherries with an inch of stem attached and place them in jars with alternate layers of powdered sugar until the jars are three-fourth full. Then fiill the jars with cold spiced vinegar and seal them at once.

Pickled Cherries — (Non-heating Method)—Wash and seed perfect cherries and then weigh them. Place them in a stone jar, cover them with vinegar, and let them stand over night. In the morning drain off all the vinegar and add to the cherries as many pounds of seeded fruit. Stir this mixture frequently until the sugar dissolves; this requires about three days. When the process is complete, pour the fruit and syrup into jars that have been sterilized by boiling in water for twenty minutes and seal them at once.

Cherry and Pineapple Marmalade—Wash, drain, and seed the cherries, and run them through a meat grinder. Much of the juice is lost in this process; but long continued cooking makes the flavor strong, and removing part of the juice remedies this in part. Peal and slice the pineapple and run it through the meat grinder. Mix with the ground cherries a fourth to a third as much ground pineapple Place the mixture on the fire, add two-thirds as much sugar, and cook the whole slowly until it becomes thick (almost constant stirring is necessary to prevent burning). Pour the marmalade into jelly glasses and cover it with melted paraffin. The flavor of this marmalade is almost as good if a considerably smaller proportion of pineapple is used.

Sun Preserved Strawberries—Select large, firm berrise, wash them carefully, place them in a ganite preserving kettle with an equal amount of granulated sugar, heat the mixture until it boils, and continue the boiling for five minutes. Then place the berries in platters so as to have a single layer. Set the platters outdoors in the sunshine and leave them all day (it is necessary, of course, to protect the fruit from insects and dirt by using netting or by some other device). Remove the platters to the house at night, but replace them in the sunshine next day. Continue the sunning until the berries are of the consistency of jam. The put the preserves in jelly glasses and cover them with melted paraffin. It is some trouble to preserve strawberries in this way, but the flavor of the product is so exceptionally pleasing that the result is worth the effort.

Found Relief When Doctors Had Failed

MANITOBA WOMAN PRAISES DODD'S KIDNEY PILLS.

Mrs. Murmylo Says to All Who Suffer From Bladder Trouble: "Try a Box of Dodd's Kidney Pills."

Brokenhead, Man., July 4—(Special.)—Strong in her praise of Dodd's Kidney Pills is Mrs. Mary Murmylo, a well known and esteemed resident of this place. And Mrs. Murmylo gives her reasons.

"Two years ago I suffered from bladder trouble," she says. "I tried all kinds of medicines and two doctors in Winnipeg. All the doctors and medicines failed to help me.

"I turned to Dodd's Kidney Pills and used eight boxes of them and found them satisfactory. I give every praise to Dodd's Kidney Pills, and to any person suffering from bladder trouble I say, 'Try a box of Dodd's Kidney Pills.'"

Dodd's Kdiney Pills act directly on the kidneys. By putting them in condition to do their full work they relieve bladder troubles and send pure blood and good health coursing to all parts of the body.

Ask your neighbors if Dodd's Kidney Pills do not relieve kidney ills and those diseases that spring from sick kidneys.

SELF CONTROL.

Did you ever add comfort and happiness to your lot by trying to get even with the fellow that you thought had treated you in an unfair way? Of course you have because that seems to be a part of human nature. But did you ever stop to think that nothing is gained by being mean just because you think that someone has been mean to you? The minute that you forget yourself and think that you are getting even by returning the unkind act or word, then you are placing yourself upon the same level with your supposed enemy. And no matter what he has done, any act or word upon your part cannot remove the damage if done in a spirit of revenge. This is true whether you think so or not and revenue for an unkind act or word always harms you.

No one has ever gained anything by repeating the gossip which he is bound to hear about others. Repetition usually means addition of untruths and the first thing that you know things are being said which hurt the charactre and reputation of some one. It isn't fair to yourself nor to the other fellow. It does neither of you one bti of good.

You may think that it makes you feel good for the time being. But does it? Think it over. Go back to some case in which you were involved and ask yourself if you received any comfort for your rash act. I think you will agree with me that it didn't get you anywhere, but, on the other hand, you made yourself very unhappy. It is a pretty good rule, old though it ma be, not to say antyhing about the other fellow unless it is something good. There is no better wa to gain the confidence and friendship of others than to follow this rule. People learn to love and respect that person who is ever thoughtful of the other fellow.

No one can be eminently successful who is continually fault finding and seeking revenge. It means time taken from the very things which should be receiving attention in order to be successful. There never has been a really big man or woman who was considered a gossip. Trouble makers are rarely successful and the minute you form the habit of trying to harm the other fellow, you become a trouble maker. It's a bad habit and we should all attempt to keep from forming it.

Head Ached So Bad

HAD TO GO TO BED.

When the liver becomes sluggish and inactive it does not manufacture enough bile to thoroughly act on the bowels and carry off the waste matter from the system, hence the bowels become clogged up, the bile gets into the blood, constipation sets in and is followed by sick and bilious headaches, water brash, heartburn, floating specks before the eyes, and painful internal, bleeding or protruding piles.

Milburn's Laxa-Liver Pills regulate the flow of bile so that it acts properly on the bowels, and stirs the sluggish liver into activity.

Mrs. E. Bainbridge, Amherst, N.B., writes:—"I take pleasure in writing you of the good I received by using Milburn's Laxa-Liver Pills for headache. I was so bad I had to go to bed, and could not sit up. A friend told me about your wonderful medicine, and two vials have made me as well as I can be."

Milburn's Laxa-Liver Pills are 25c. a vial at all dealers, or mailed direct on receipt of price, by The T. Milburn Co., Limited, Toronto, Ont.

GOOD HOME-MALE SOAP.

To make homemade laundry soap, dissolve one can of lye in three pints of rainwater. Add two ounces of borax and a half cupful of ammonia. Take two and two-thirds quarts of grease and heat until likewarm.

When the lye liquid gets lukewarm pour gradually into the warm grease, stirring for about 10 minutes. Use an old dishpan to put it in. When cold, cut squares and pack in an old stone jar. This makes from twenty-two to twenty-five good sized cakes. For best results in the laundry shave it up fine in a dishpanful of cold water and bring to boiling point, then add to the clothes in the washer as needed. The borax and ammonia are great cleansing agents, and our clothes are beautifully clean and sweet when washed with the soap.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

ANNUAL CONVENTION OF THE WOMEN'S INSTITUTES OF N. S.

(Continued from page 757)

age from the Duchess of Devonshire, their patroness, expressing interest in the convention and wishing it every success. A message from Judge Murphy was also read, extending greetings from the Federal Institutes, and another from Mrs. Muldrew, who sent best wishes for a most successful convention.

Problems of The Rural Schools.

Mr. L. A. DeWolfe, Director of Rural Science for the province, addressed the meeting in a general way on the problems of the rural schools.

The Rural Science Buleltin was shown and explained to be free to all who desire it.

Mr. DeWolfe spoke of the bill recently before the House re women being eligible for trustees on the school boards, only rate payers are allowed at the present time. This bill was turned down and the excuse given was that the women had not asked for it. The proposition had been framed by Hon. Mr. Wickwire, of Kings. He told this so that they might go after it next year by interviewing their local members and see that they get the right to vote at the board. Mr. DeWolfe then explained the work in which he is engaged. The school life of the children is being made more interesting and they are being taught that which will help them in after life, such as a knowledge of cooking, gardening and practical work with literature for reference. The children were taught to make gardens—not only the growing of vegetables but flowers to please the eye and a pride in making their school grounds prettier is instilled in them.

There is more to education than that which is learned from the text books of the schools. Education has been said by some one to be "that which you get after you have forgotten all you have learned." If the teacher teaches that disease germs are carried it must be seen that these hygiene lessons are carried out in practice. This will condemn and do away with the open drinking bucket and common cup.

If the need of fresh air is taught, see that they get it and not be cooped up in ill-ventilated rooms. These things must be followed up.

The institutes can be of great help to the teachers. If the teacher is not conpetent of teaching the rudiments of cooking or sewing, let some good cook in the section or some woman handy with the needle come in and give this instruction. The equipment may be donated.

Have a doctor come in and talk on the care of the eyes and teeth. This instruction coming from the doctor, the children will take greater interest. Let some man, with a knowledge of carpentry, teach the boys the use of common tools, and do not use sme old, worn-out saw but see that proper tools are provided.

The Women's Institutes should express the intelligent opinion of the section. Talk over matters with the teacher, see that the children are taught promptnes and punctuality.

The institutes may provide pictures for the walls, soap, towels, hot lunches or introduce a library corner in the school room.

Mr. DeWolfe also told of the good work that is being done in the remote districts by the travelling teachers Upper North Sydney has sent in a letter highly commending that effort. tion.

After the reading of a few extracts from one of his bulletins by Mr. DeWolfe, the meeting adjourned.

Thursday, 2.30 P. M.

The report of the finance committee was read by Miss Stuart, asking the Institutes to pay $300 into the Federation fund and asking authority to present this matter to the various institutes and raise this money by allotment.

This report was moved by Miss Schafheitlin, Canning, seconded by Mrs. McQuarrie, and carried unanimously.

The supervisor then reported the sum of $10 raised by the subscription list for the Austrian relief.

Soldier Settlement.

Miss Campbell, of Ottawa, then addressed the meeting on the subject of the Soldiers' Settlement Board. Mrs. Muldrew, who was to have taken this subject, being unable to be present.

Miss Campbell was thoroughly conversant with her subject and explained in a very full manner the workings of the board—how when the period of reconstruction was first considered it was realized that many of the returning soldiers would never be able to take up the work in which they had been engaged before the war, and so the government determined to make it easy for those who wished to go on the land. To that end money is loaned to returned men wishing to buy a farm at the low rate of 5 per cent. with a period of 25 years in which to pay this back. Money is also loaned for equipment, payable in 6 years. The man chooses the land, submits his plans to the government and his claim is investigated. If married it is necessary to obtain the wife's consent to settle there or he is not allowed to take it up. Many are willing of course to do so, but many are not used to farm life and it was to help these soldiers and their wives that the Home Board was established, with Mrs. Muldrew as director, Miss Campbell as assistant, and soon there will also be district directors.

In no two district in Canada can the work be carried on alike as the local conditions, in the different parts, must be considered. It is therefore the work of this branch to go into the homes and find their needs, and work directly in a manner best suited to the most pressing demands.

In some places it is found that the greatest work lies in saving the mothers and babies. Mrs. Muldrew got in touch with the Victorian Order of Nurses, also the Red Cross, and received generous aid from them. The Red Cross in Saskatchewan made the splendid offer of financing nurses for this work for a period of two years if a suitable building was put up. The medical profession was also helping greatly in this work.

In some cases it was found that just a little more community spirit was needed more than anything else. There are so many English brides in the west who just long for the sight of some one from their own home land and who are lonesome and unhappy. The Red Cross was applied to for help in the holding of a convention of soldiers' wives. They gladly gave them transportation and the universities took up the entire cost of instruction. The members of Local Council of Women received them as guests in their own homes; some of the women could not leave their babies, so they were told to bring them, too. Seventy-two mothers and 22 babies attended. There they met friends and made lasting friendships. A happy time was enjoyed by all and their lives were brightened wonderfully besides the courses were of inestimable value to them in their new life, as many of them knew nothing of working under rural conditions. These courses were put on just before the spring work, and were repeated in many places in the west. Personal work is the aim of this branch and they are meeting with cordial treatment on the whole.

District directors are soon to be appointed in New Brunswick and Nova Scotia. Very little has been done in the east as yet, except in Prince Edward Island. The first courses have been put on there, where they had the hearty support of the Rotary Club and other organizations and received free tickets for all of the delegates from the managers of the moving picture houses good for the entire six weeks of their stay.

There are over 400 of these settlers in Nova Scotia where it is hoped to begin work soon and the Women's Institutes will probably be called on for ors for Nova Scotia. They, already, have five in British Columbia, four in Alberta, one in Ontario, one in Prince Edward Island, one in New Brunswick, and one in Quebec. These directors work closely with the immigration officials. They will instruct in pre-natal care, seek out expectant mothers and give help, teach sewing, the making of layettes, canning, and many other branches of work.

Miss Campbell closed her remarks by wishing the Women's Institutes all possible success and thanked them for the help which they had rendered one of their soldiers in Alma.

Children's Aid.

Mr. E. H. Blois, Supt. Children's Aid, Halifax, then adressed the meeting. The Children's Aid Society is an incorporated body with definite objects to work for. Their work is of a special character—they are caring for 2,000 children altogether with 1,000 actual wards. The first aim is to prevent cruelty and although it is probably not generally known, there have been 100 cases in the province of Nova Scotia in the last seven years since this society has been formed. They removed the children from these evil homes, where, in some cases, conditions were almost unbelievable. In some cases a warning followed up by repeated visits was sufficient. Then there are the run-away boys and girls who they look after, for many are leaving home at the age of 13 and 14 years.

There is also the orphan class of children, many of whom were left so by the flu and also a large number soldiers' chidren.

Much time is taken up listening to family quarrels and in many cases a little advise is successful in keeping the home together, but in other cases this is not always wise.

Mr. Blois said although public opinion was to the contrary, the worst conditions were found in the rural districts. The lowest morals and degrading conditions are without dispute there. They gave help to young girls, their belief being to give all a fighting chance.

The Aid Society found foster homes for many children, also boarding homes.

Then there is a branch for the delinquent children who have committed some offense against the law—usually theft. A large number of

ALL safety razors seem alike because of the similarity in size and appearance. As regards the AutoStrop Razor, however, the resemblance ends there. Its peculiar and additional advantage is that, without being larger than any other safety razor, it combines within itself a self-stropping feature that enables the user to keep the blade sharp without taking anything apart. It thus prevents dull blades and the expense of buying new ones.

You may not be interested in economy of blades, but surely you want a good shave and that is only possible with a stropped blade.

Any dealer will demonstrate the AutoStrop Razor to you, guarantee satisfaction, or refund of purchase price. Only $5.00—complete with strop and twelve blades in an attractive assortment of cases.

METHODS OF GROWING TOMATOES.

(Experimental Farms Note)

Tomatoes should be kept growing from the time the seed germinates until the fruit is ripe. If sown in the hod-bed very early they are likely to receive an injurious check when held back until it is safe to plant them out. When the seed is sown about the middle of April the seedlings are ready to prick out into flats about the 10th of May and should be ready to set out immediately after the early June frost, which usually occurs in Prince Edward Island the first week in June.

They are ready to prick out into the flats when they have the third leaf. In setting them out they should be planted so that the first leaves are about level with the ground. A little clay may be mounded around them to protect them from the wind.

Any good garden soil is suitable for tomatoes. It is usually best to delay manuring the plants until after the first fruit has set. Most amateurs make the mistake of planting in soil that is too rich in nitrogen manure which produces great vines with late fruit or a very large percentage of green fruit. Once the fruit has set, then liquid or other forms of manure may be applied generously.

A series of experiments were conducted with two varieties, "Bonny Best" and "Sparks Earliana," for several years at the Charlottetown Experimental Station, to determine the best method of growing tomatoes. Five methods were used with each variety as follows:

No. 1. The plants were set four feet apart each way and the plants allowed to spread over the ground. They were unpruned and left lying on the ground.

No. 2. Planted two feet by four feet apart. The tomatoes were pruned to two stems and tied to wires.

No. 3. Planted two feet by four feet apart. The tomato plants were pruned to one stem and tied to stakes.

No. 4. Planted two feet by four feet apart, pruned to one stem and tied to wires.

No. 5. Planted two feet by four feet, pruned to one stem, tied to takes and one-half of the foliage removed during the pruning period.

The first method produced the greatest quantity of fruit each year with both varieties. The tomatoes were later ripening than with the other methods and the total quantity of ripe fruit from the plot was less than on the plot grown by the second method, where the plants were pruned to two stems and fastened up with wires. The second method gave the largest returns of ripe fruit. This was closely followed by method No. 3, which produced the most early ripe fuit though not the greatest total quantity. The removal of the foliage in method No. 5 decreased the quantity of both ripe and green fruit, but greatly increased the percentage of ripe fruit on the plants.

Large quantities of tomatoes can be produced by planting four feet apart each way with the least amount of labor. A good percentage of ripe fruit can be obtained if the plants are not supplied with nitrogenous manures until after the tomatoes have set. The method that was most successful in producing ripe fruit early in the season was that of tying the plants to stakes placed two feet apart in the rows.—J. A. Clark, Superintendent, Experimental Farm, Charlottetown, P. E. I.

MANGEL GROWING.

(Experimental Farms Note.)

The growing of mangels has received a great impetus in many districts owing to the serious loss among turnips, caused by club-root. The mangel is attacked by very few insects or diseases, and when successfully grown produces immense yields of suoculent food, so necessary for live stock during the winter and spring months.

Sound fresh plump seed should be secured and large quantities of the very best home grown seed are now on the market. The mangel requires planty of moisture and should be planted in good well tilled land early in the season. It works in very well with the following five year rotation: Barley or mixed grain, mangels, grain seeded down with clover and grasses, hay, pasture. About one-half of the manure (12½ tons) is applied to the barley stubble and plowed under in the antumn the balance (12½ tons) is worked into the land as soon as it is fit to work in the spring. When the land has been worked so that it is mellow and fragile it is thrown up into low drills 30 inches apart and the tops of these dragged off with a pole or fence rail. The seed is then sown about 1½ inches deep, at from 4 to 6 lbs. per acre, according to the quality of seed. The "Planet Jr." cultivator and seeder is a very satisfactory implement for this work. This is followed by a heavy roller firming the earth about the seed so that it may get sufficient moisture for germination. During a dry period it is well to seed in the evening so that the earth may remain damp about the seed for a longer time. The most important point in getting a good catch is to have the seed deep enough, so that it will not dry out, and to have the soil pressed firmly about the seed. It pays to take extra time and trouble to put the seed in right even if it is necessary to make a trench with a hoe for the seed and to cover and pack the earth down with the feet.

As soon as the plants are up in rows they should be edged with a hoe or hand cultivator. The latter will straddle the row and do both sides at once. The horse cultivator should then be run through the rows every week or after every heavy rain until the tops cover the ground. Thorough persistent cultivation will add greatly to the crop by conserving moisture and by desrtoying weeds. The plants should be thinned to about 10 inches apart in the rows by the time they get four leaves, and hoed a second time before the roots swell.

Mangels should be harvested before severe frosts occur. Thy should not be topped so close that they will bleed, and should be handled carefully if they are to be stored for a long period. They should reecive plenty of ventilation when in storage. The "Yellow Intermediate" is easily harvested. It is one of the best yielders and contains a large percntag of dry matter.—J. A. Clark, Superintendent, Dominion Experimental Farm, Charlottetown.

USE OF SEAWEEDS.

There are three types of seaweed used for fertilizers in the Maritime Provincs. The most common is known as eel-grass, and comes ashore in large quantities along the bays and rivers the others are rock-weed, which comes on shore along the seacoasts, and kelp, a large, coarse seaweed, that comes in from the deep sea.

A chemical analysis of sun-dried eel-grass gives it about the same fertilizing value as stable manure per ton. Those who have used it, however, for a unmber of years, know that it is not radily available as a plant food, and when ploughed under it often remains in the soil to be ploughed up again, with very little apparent change, seven or more years later. Eel-grass, when applied to the land for the first time, will usually greatly increase the crop. The salt present may be one of the factors in improving acid lands. It opens the soil for potatoes, and not only increases the crop, but acts as a preventative of some diseases, producing splendid, clean potatoes. It is most useful, however, when used in conjunction with barn-yard manure. It is a good absorbent when dry, and soaks up large quantities of liquid manure about a stable or barn-yard. It can be usefully added to a compost to increase the bulk and prevent the hotter manures from wasting.

The kelp and rock-weeds are mush more readily available, as they will rot when composted by themselves, and are valuable sea-manures, contain at certain seasons a considerable quantity of potash salts. They are used it as a mulch around trees in an ly, and greatly supplement other fertilizers.

The eel-grass is used a great deal as banking for buildings and root cellars, as it is a good non-conductor, and keeps out the frost. It is also now extensively used for upholstering, and when properly saved and cured is quite valuable. It is one of the best mulches for strawberry plantations, keeping down the weeds, and preventing the berries from coming in contact with the earth. Some have used ot as a mulch around trees in an orchard left in sod to keep down the grass.

Experiments have been conducted at the Charlottetown station with

T. E. BISSELL CO., LTD., Elora, Ont.

both sun-dried eel-grass and the ground sea-weed fertilizer that was put up by the government at Clark's Harbor, N. S. The ground sea-weed fertilizer was also tested on ten other farms in Queen's county, under the supervision of the writer. On four farms increases were reported in the yield of potatoes; two farms showed a loss where the fertilizer was used, and four farms did not show any difference from the application except in the color of the foliage, which was darker.

The seaweeds are useful as absorbents about a barn-yard. They add to the bulk of manure about the farm, enabling a more even distribution to be made over a greater area each year. They are fairly rich in fertilizing constituents, which they give up slowly to the plants through several seasons.—J. A. Clark, Superintendent, Experimental Station, Charlottetown, P. E. I.

UNITED FRUIT COMPANIES HOLD IMPORTANT MEETING.

The United Fruit Companies of N. S. held their director's meeting on Saturday last at the office of the company at Kentville. It was a well attended gathering and was the most successful and harmonious gathering ever held in the history of the Central Company. The discussion over the financial statement of the year was given without adverse criticism of any kind and the directors were highly pleased with the success of the year's operations.

The financial report showed that the company had taken care of old potato claims and apple claims from 1918 to 1919 amounting to about $110,000 and had a good cash bank account and $5,260.00 paid-up capital and still had a balance in the profit and loss account of the year just closed of $22,[illegible]0.10.

The year turnover of business is an immense one and was reported as follows:

Turnover Season 1919-20.

Apple account	$1,695,118.19
Flour and feed	509,427.53
Fertilizer	192,964.58
Merchandise	47,197.87
Spray material	57,331.02
Seeds	57,393.58
Potato account	434,559.57
	$2,994,032.34

Gross Expenses

Advertising ....$	466.50
Board of Management .	1,322.15
Delegate expense	909.23
Office expense	6,491.57
London office	3,555.66
Organizaion expense ..	28.05
Salary account	11,600.39
Telephone, etc	3,588.41
Transportation	1,483.38
Havana office	4,438.36
Inspection	2,773.84
	$36,711.54
Percentage of expense	1.22

The directors took definite action at this meeting to provide means of disposing of the poor class of fruit so as to keep it off the export markets. The Board of Management were instructed to take measures for the erection of a canning factory and also a vinegar plant and also for the purchase of an exapporating fctory. Towards these different plants the board was authorized to spend a sum not to exceed $50,000.

This will be a most important move on the part of the Central Companies, and when arrangements are completed will dispose of a great quantity of fruit which otherwise might be forced on the markets.

UNITED FRUIT COMPANY MEETS.

The quarterly meeting of the Board of Directors of the United Fruit Company Limited, opened at Kentville, on Saturday, June 11th.

President Bishop was in the chair. The reports show that the affairs of the company are in excellent shape, there was a lengthy and enthusiastic discussion with reference to the establishment of canneries, as well as vinegar factories in the valley for the purpose of taking care of apples that are not strictly up to the Nova Scotia standard for shipment abroad. The Board of Directors unanimously adopted the proposition, and instructed General Manager A. E. McMahon to proceed accordingly.

Saturday night was a great night in Port Willliams, the occasion being the annual banquet of the Port William Fruit Company, Limited, which was attended by over seventy ladies and gentlemen. The president of the company, George Starr, made an ideal presiding officer, and delivered one of the best speeches ever heard in Temperance Hall.

T. L. Harvey, the European representative of the United Fruit Company in England, gave a very interesting talk on his experience in that market, as well as his views on the future of the Nova Scotia apple in Europe. Albert E. McMahon, the general manager of the United Fruit Company, Limited, made a splendid speech. Another excellent address was by Professor W. Saxby Blair, superintendent of the Experimental Farm and Mayor of Kentville. The affable professor is always a popular speaker, and was thoroughly enjoyed.

Clean a few more acres of rough ground.

A cream separator because it will bring greater profits.

An appreciation of the fact that hogs can be kept clean.

Consider every rat about the place an enemy.

Give the boys about the place enough genuine responsibility to make them love to remain there.

Keep all machinery under some sort of shed.

Nothing but best of stock after this.

Cement or concrete wherever it can be used.

ANNAPOLIS VALLEY REAL ESTATE AGENCY,
FRED E. COX, Prop., Middleton, N. S.

ANNUAL CONVENTION OF THE WOMEN'S INSTITUTES OF N. S.

(Continued from page 760)

these children throughout the province are on probation and are making good. All assistance possible is given them by the Aid to overcome environment conditions.

Another branch of the Society looks after the feeble minded child. This is a work in which the ladies must take a part. The Women's Institutes can help in the maintenance of this work. As the work affects every man, woman and child in the province, "you don't know where you may be hit; at any time one of these children may move into your neighborhood and menace your child." A few cases in a district are far more deadly than small-pox. The influence radiates and touches every home in the community.

The Institutes can help, if there is an Aid Society in their neighborhood, by joining it or by sending 50 cents per member to the General Society. Help by suggesthing foster homes for children or homes that will partly support one. Children are physically examined and no diseased children are sent.

Mr. Blois made it very clear, as Miss McDougall afterwards expressed it, that there was lots of work for all to do.

Mrs. Ogilvy expressed the opinion that some action should be taken by the convention on the prohibition question and a discussion followed. Mrs. Balcom thought the responsibility rested with the women.

Miss Stuart, when called upon, said she was much interested and thought the Women's Institutes could crystalize opinion by taking a stand.

Mrs. McQuarrie said the voting list should be looked after so that all names would be recorded.

Miss Fraser thought our hope was in the training of the future generation, although she would say for prohibition that it had helped the men who occasionally drank, but who having too much honor to break the law of the land, have cut it out.

Mrs. Hamilton was against the present provincial act.

Mrs. Balcom thought the paramount question was, "Are we going to allow Montreal to send all the liquor they choose into our provinces?"

Miss Stuart, speaking again, said prohibition must do some good. It has kept the liquor from those who are indifferent. Those who are drunkards will not be here long and those coming on will not follow in their foot-steps.

Miss McDougall brought the discussion to a close by saying that this is a matter that should be well discussed in the various institutes before the plebiscite comes to ascertain the voice of the different societies and then take action as a body and register their opinion.

Thursday Evening.

Miss McDougall presided at the Thursday evening sesison, which opened with community singing led by Mr. H. A. Wellard. Dr. C. S. McArthur, Truro, then gave an interesting address relating to the teeth.

Teeth: Their Importance and Care.

The Supervisor, he said, had written to the Dental Association for some one to address them and he had been asked to do so.

Primitive man existed for himself. The law of the jungle was the only one recognized. Sickness was virtually unoknown. He chose his home where he could most easily provide for his family. Contrast our modern civilization. We exist to combat disease, the resiult of this so-called civilization, and it is only by co-operating and mutually banding together that we can defend ourselves.

Of the three most widely spread diseases of the world, decayed teeth is one. Conditions primarily the cause of these diseases are unsanitary living condition, bad air, unsuitable food, etc. Steps are to be taken immediately by the Red Ceoss through the travelling clinics to remedy the primal cause of the disease.

We have it on the authority of Mayo Bros. and the late Dr. Osler that in the next decade the dentist will more than ever be looked to, to combat diseases. It is worth while to care for the teeth, especially the first teeth of the child. It must be remembered that a child has its whole first set of teeth, twenty in number, at the tge of two years. Any teeth afer that are permanent teeth. At 6, 12 and 18 the child cuts the first, second and third molars. The 6 year molars are the first permanent teeth and come in behind the temporary teeth.

The primary teeth should be shed naturally. At four years of age the end of the roots begin to absorb and it takes 3 years to complete this process when, the tooth is ready to be assistance. There will be two directshed. During this time as the nerve absorbs ,the permanent tooth comes down.

When a child looses these temporary teeth the tendency is that nature fill the space so that the permanent teeth have not proper room to come down, except in an irregular way. Every child with the first 20 teeth shoold be taken to a dentist regularly for examination.

Irregularity is not the worst result. Although, when once one tooth is out of place, that side of the jaw will be malposed.

The care of the teeth has proved to be worth while. The Canadians had the honor, during the recent war, of being te first nation to equip a dental corps. A man turned down on account of his teeth could be speedily put right. They were able to put 10 per cent. more fit men in the front line trenches as a result of this dental corps and consequent good mouth conditions. Fifty business concerns in the United States demand periodical dental treatment of their employees. Swift and Armours being two of the firms, who employ a dentist to look after this. This is a hard and fast business proposition.

In the Cleveland public school an experiment was made on two classes of fifty pupils. One class received dental attention, had no liquid allowed them with their food, and brushed their teeth regularly after each meal. The other class had no attention given their teeth. This was carried on for one eyar. At the end of that time they were examined in writing, arithmetic, spelling and other subjects. The class having their teeth cared for were 16½ points ahead of the other class and it was noticed that their deportment was also better. The children must be educated either through the teacher or dentist giving talks or by moving pictures.

Reports should be sent to the parents after examination advising them of the condition of the child's mouth. If cost figures here, these cases should be attended to by the municipality.

Truro has done this and patients accompanied by a nurse are received each month on certain days by the dentists.

We hear much of pyorrhea which is caused by an uncleanly mouth. Tartar, which a tooth brush will not remove, bad-fitting bridges and temporary teeth not fitting properly and allowing the food to collect underneath, are the cause. This can be cured but probably not to stay cured. The cause can be corrected by keeping the teeth in as good a condition as possible.

Public Health.

This instructive address was followed by Dr. Hattie, of the Provincial Health Department, who took the place of Mrs. W. H. Dennis, whose name was on the program, but who through illness in her family, was unable to attend

Dr. Hattie said he was pelased to apepar before the convention and endorsed all that Dr. McAarthur said re the importance of the care of the teeth and its relation to the general health. He spoke of a personal experince bearing this out, in the case of his own son having been stricken sudednly with acute rheumatism, which entirely subsided with the removal of two decayed teeth. He then outlined the peace time program of the Red Cross Society and urged that the women co-operate with them in the carrying out of the public health campaign.

The Red Cross was formerly a war time organization, but at the conference in 1919 it was decided to organize for peace time work and carry on as the American Red Cross does, to be ready for any great crisis that might confront them. The Canadian Red Cross has already encouraged public health work by contributing large sums of money for its maintenance. They have new quarters in Sherborne street, Toronto, and have there all equipment for any sudden emergency that may arise. Provincial branches also have supplies in case of sudden need. The Child Wlfare Association is planning to have, through the help of the Red Cross, a child welfare week in the near future.

The Department of Health in each province is to head all health work. Each province is to undertake its own work, but not to over-lap any work benig done by existing organiztaions. Outlining the program for Nova Scotia, Dr. Hattie said twenty scholarships of $200 each have been offered to graduate nurses to take a course in public health nursing.

A travelling clinic has been organized and $25,000 voted by the Red Cross to put in every county a public health nurse for one year. It was hoped by that time that they will so prove their usefulness that the provincial government and county councils will take a hand to finance them. It will take time for the nurses to establish themselves. Tell others of this work and see that the nurses are notified of cases needing care.

When the nurse is not in the clinic she will be carrying out medical inspection in the schools and will be followed by the doctors in the public health service. A dental clinic will also be established. It will be necessary that the Red Cross shall have funds to carry out this program. The next Red Cross drive will take the form of a drive for membership at $1.00 per year.

Dr. Hattie closed his address by appealing to all to lend all aid possible in this health campaign.

MOUNT ALLISON LADIES' COLLEGE

Founded 1854. Session 1920-21.

OPENS SEPTEMBER 6

This is the largest Residential Ladies' College in Canada.

WE STAND FOR—High Ideals, Soul Culture, Intellectual Equipment.

WE GIVE COURSES IN—Music, Oratory, Household Science, Literature, Fine Arts and University Matriculation. Business Courses are provided by the Academy affiliated with us.

WE POSSESS—An enviable reputation of almost continental scope.

Our Art Museum is a feature where we consider we stand without a peer. Free Calendar on application to

REV. HAMILON WIGLE, B.A., D.D. Prin.
SACKVILLE, N. B.

MOUNT ALLISON UNIVERSITY

Annual Session 1920-21.

OPENS SATURDAY, SEPT. 18

Many Scholarsips and Prizes are Offered. For information regarding Courses of Study, Degrees, Scholarships, Prizes, Affiliated Relations, Expenses, etc.

SEND FOR CALENDAR.

Incoming Students wishing Residential Accommodation—for which MOUNT ALLISON IS JUSTLY FAMOUS—should give earliest possible notice.

Courses in

ARTS, SCIENCE, AND THEOLOGY.

Rev. B. C. BORDEN, M.A., D.D., President
SACKVILLE, N. B.

MOUNT ALLISON ACADEMY

Offers General, Special, and Matriculation Courses leading to the Colleges of Arts, Engineering, Medicine, etc. Manual Training.

MOUNT ALLISON COMMERCIAL COLLEGE

Offers Colrses in Business, Shorthand, and Typewriting, Penmanship, etc.

Comfortable Residence, Strong Staff of Experienced Teachers

A limited number of positions available by which students, either male or female, may assist themselves to pay expenses.

FIRST TERM BEGINS SEPTEMBER 6.

Calendar Sent on Request.

J. M. PALMER, M.A.. LL.D., Principal
SACKVILLE, N. B.

Col. F. V. Woodbury, organizer of the travelling clinics, then addressed the meeting. He explained that the health caravans are primarily for public health purposes and that is a very wide field. They consist of physicians, surgeons, nurses and child welfare workers who are being paid to go around and preach and teach the gospel of health, especially for children.

There will be a motor truck, two ambulances and two touring cars. Each caravan will have a dentist with the most modern dental equipment on wheels, an ear, eye and throat specialist, operations will be performed free and there will be a certain number of beds in which to care for patients. Specialists for tuberculosis will also be along to confer with the local doctors and to go to remote places for consultation—a specialist that will be able to give a definite opinion.

All will do as much work as possible and give advice. The day will end with a public health meeting in the evening.

Dr. Woodbury asked the Institute members to pick out the place where they could work best, get in touch with their Red Cross Society and be prepared to help.

The local committee is expected to have ready a suitable, clean building, in which to establish the clinic, a church or hall for the public lecture, a large number of posters will be provided and must be distributed. A liberal supply of hot water must be available and the billeting of the personnel attended to. A supply of gasoline, about 40 gallons, and 5 gallons of motor oil, must also be available for the refilling of the motor cars.

These caravans will leave Halifax on July 12th and 14th respectively. Following is the itinerary subject to change:

ITINERARY

Route ONE Leaving Halifax July 14.

Brooklyn, Hants Co.—Arrive July 14th P.M. Leave 16th A.M.

Gaspereaux—Arrive 16th P.M. Leave 17th P.M.

Kentville & Wolfville—Sunday 18th.—Limited No. speakers available for churches, Sunday Schools, etc., on application.

Hampton—Arrive 19th P.M. Leave 21st A.M.

Church Point—Arrive 21st P.M. Leave 23rd A.M.

Tusket—Arrive 23rd P.M. Leave 26th A.M.

Yarmouth—Sunday 25th.—Limited No. speakers available for churches, S.S., etc. on application.

Pubnico.—Arrive 26th P.M. Leave 28th A.M.

Barrington Passage.—Arrive 28th P.M. Leave 31st A.M.

Shelburne—Sunday, August 1st.—Limited No. speakers available for churches. S.S., etc., on application.

Port Mouton—Arrive 2nd P.M. Leave 4th A.M.

West Dublin—Arrive 4th P.M. Leave 7th A.M.

Lunenburg—Sunday 8th.—Limited No. speakers available for churches, S.S., etc. on application.

Arrive 9th P.M. Leave 11th A.M.

Halifax—August 12th. Meeting.

Tangier.—Arrive 13th P.M. Leave 16th A.M.

Sheet Harbour—Sunday 15th—Limited No. speakers available for churches, S.S., etc., on application.

Sherbrooke—Arrive 16th P.M. Leave 18th A.M.

Isaac's Harbour—Arrive 18th P.M. Leave 21st A.M.

Boylston—Arrive 21st P.M. Sunday 22nd—Limited No. speakers available for churches. S.S., etc., on application.

Garden of Eden District—Arrive 24th P.M. Leave 26th A.M.

South Maitland—Arrive 26th P.M. Leave 28th A.M.

ITINERARY

Route TWO Leaving Halifax July 12.

Truro—Arrive 12th P.M. Public meeting only. Leave 13th A.M.

Five Islands—Arrive 13th P.M. Leave 15th A.M.

Advocate Harbour—Arrive 15th P.M. Leave 19th A.M.

Amherst—Sunday 18th—Limited No. speakers available for churcres, Sunday Schools, etc., on application.

Malagash (or Wallace Bridge)—Arrive 19th P.M. Leave 21st A.M.

River John—Arrive 21st P.M. Leave 24th A.M.

Pictou and New Glasgow—Sunday 25th—Limited No. speakers available for churches, Sunday Schools, etc.

East River St. Mary's.—Arrive 25th P.M. Leave 28th A.M.

Antigonish—Arrive 28th P.M. Leave 30th A.M.

Harbour Au Bouche—Arrive 30th P.M. Moving pictures only.

Mulgrave—All Day 31st August. Sunday 1st.—Limited No. speakers available for churches, Sunday Schools, etc., on application.

St. Peters—Arrive 2nd P.M. Leave 5th A.M.

Gabarus—Arrive 5th P.M. Leave 7th A.M.

Sydney's—Sunday 8th—Limited No. speakers available for churches, Sunday Schools, etc. on application.

Little Bras D'Or—Arrive 7th P.M. Leave 10th A.M. for Ingonish District via. Road or S.S. Aspy.

North Sydney—Sunday 15th.

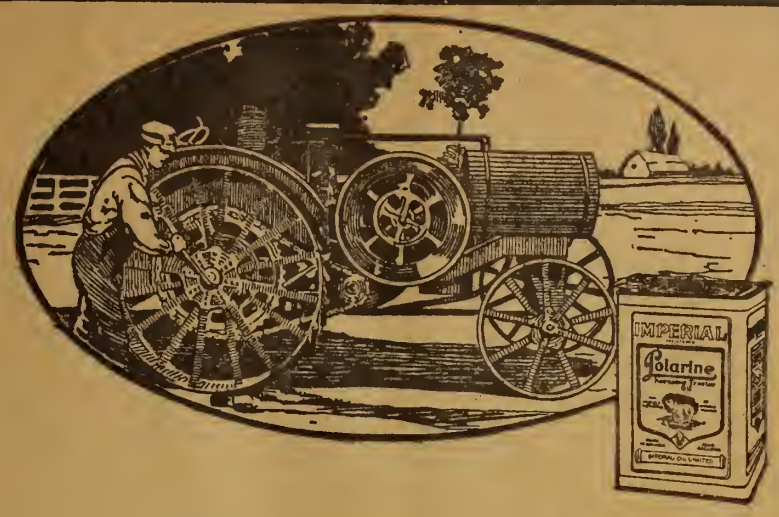
Wycocmagh—Arrive 16th P.M. Leave 18th A.M.

Baddeck—Arrive 18th P.M. Leave 20th A.M.

Margaree Forks—Arrive 20th P.M. Leave 23rd A.M.

Inverness—Sunday 22—Arrive 23rd P.M. Leave 25th A.M. Limited No. speakers available for Churches, S.S., etc. on application.

Mabou.—Arrive 25th P.M. Leave 77th A.M.



Costly Farm Machinery Deserves Correct Lubrication

IMPERIAL

Lubricants

For gasoline-burning engines—automobiles tractors, trucks.

IMPERIAL POLARINE AND IMPERIAL POLARINE HEAVY

For motors requiring an unusually heavy oil.

IMPERIAL POLARINE A

For kerosene-burning stationary engines and tractors.

IMPERIAL POLARINE KEROSENE TRACTOR OIL AND IMPERIAL POLARINE KEROSENE TRACTOR OIL, EXTRA HEAVY

For open bearings of separators, binders, etc.

IMPERIAL PRAIRIE HARVESTER OIL LIGHT

IMPERIAL PRAIRIE HARVESTER OIL HEAVY

For worn and loose bearings—a thick oil.

IMPERIAL ELDORADO CASTOR MACHINE OIL

For steam cylinder lubrication—tractors and stationary engines.

IMPERIAL CAPITOL CYLINDER OIL

For stationary and portable engines using either kerosene or gasoline.

IMPERIAL STANDARD GAS ENGINE OIL

For grease cup lubrication—a clean solidified oil.

IMPERIAL ARCTIC CUP GREASE

Made in different consistencies.

Imperial Farm Lubricants are sold in 1 and 4 gallon sealed cans, half-barrels and barrels.
